The Southern Ry., through its general freight agent, F. S. Reigel, of Cincinnati, and its assistant freight traffic manager, K. B. Hannigan, of St. Louis, intervened in opposition to rate reductions from Kansas specifically, and in defense of present rates from Illinois.

R. H. May, vice-president and general sales manager of the Southern Coal, Coke & Mining Co., of St. Louis; E. M. Stanton, general sales agent of the Lumaghi Coal & Mining Co., of St. Louis, and C. P. Hoy, traffic commissioner of the coal traffic bureau of the 5th and 9th districts of Illinois, intervened in opposition to the complaint. All testified to the fairness of present rates both out of Illinois and the Southwest.

Objection to testimony concerning Illinois rates, which Mr. Phillips, for the Southwestern operators, insisted did not enter into the case, was sustained, but later the witnesses were permitted to continue. Mr. Phillips insisted that Omaha was the only city of the Missouri Valley affected to any extent by Illinois competition.

The substance of testimony concerning Illinois-Southwest competition was concisely given by W. A. Holley, traffic manager for the Central Illinois Coal Traffic Bureau, in an interview with a representative of *Coal Age*. "During the labor trouble in Kansas," he said, "Illinois coal was shipped to the Missouri Valley. But since the miners settled down to work and Kansas began producing coal, that business has steadily decreased until now it is negligible. Oil is the thing that is playing havoc with the markets of the Southwest."

H. J. Pollack, of Chicago, assistant to the coal traffic manager of the Burlington, testified in opposition to any reduction of rates in the Southwest, as also did R. P. DeCamp, of Chicago, assistant coal traffic manager of the Illinois Central. Both said present rates are reasonable. Mr. DeCamp denied any personal interest of his road in Southwestern rates. "We get our bridge toll for carrying the coal across the river between Omaha and Council Bluffs, regardless of what the rate from the fields may be," he said.

In the final session of the hearing, which closed Monday afternoon, S. G. Lutz, of Chicago, Chief of Traffic of the Chicago & Alton, intervening in opposition to the complaint, declared that the proposed reduction would create a monopoly for Southwestern mines in the Missouri Valley market, closing it to Illinois coal. "We do not oppose a general readjustment of rates whenever reductions can be brought about that will give the fullest benefit to the consumer as well as the producer. We do oppose any piecemeal readjustment," he said. Mr. Lutz testified that of his road's $27,000,000 coal-freight revenue last year, $1,000,000 was derived from Illinois coal billed to Kansas City.

The Central Illinois Coal Traffic Bureau, an intervener against the complaint, was represented by its president, H. C. Adams, and its traffic manager, W. A. Holley. Both criticised the proposed reduction as conducive to a monopoly in the Missouri Valley for Southwestern coal and declared the Southwest has no harder scramble for a market than Illinois has. "If rates from the Southwest are reduced, Illinois will be forced to seek reductions also," Mr. Holley testified. "Whatever the outcome of this action, we may be compelled to seek a return to the 1916 differential of 50c. for fine coal and 70c. for lump between Southwest and Illinois rates to Kansas City."

Representatives of Illinois coal companies and of the Springfield (Ill.) Chamber of Commerce, intervening in opposition to the complaint, substantiated the testimony of Messrs. Adams and Holley.

Hammond Favors Cheaper Production Cost And Larger Output of Anthracite

Substitutes for anthracite coal were used with sufficient success last winter to give great impetus to their continued use, John Hays Hammond stated in the course of a talk before the National Conference of Business Paper Editors in Washington, May 21. He admitted that the anthracite operators are worried by the prospect of competition from cheaper fuels. He said that the company mines had done much to stabilize anthracite prices. During the entire period from 1903 to 1917, he pointed out, the Reading company advanced its rate only 25c. per ton.

If legal and other obstacles could be removed, he said, the anthracite field could absorb many thousands of the surplus of coal miners in the bituminous districts. If means can be found for reducing the costs of anthracite production and distribution, he believes its use can be extended to the point where as many as 50,000 additional miners could be employed. Mr. Hammond stated that John L. Lewis had told him that he would rather have a union with 400,000 members who had steady employment than one with 700,000 members employed only a portion of the time.

From his remarks it could be judged that Mr. Hammond favors making public periodic statements showing the margin of profit enjoyed by each producer of or dealer in coal. While he admits that this would reveal that which is regarded as a legitimate trade secret, he is inclined to think it would be better for all concerned. He let it be known also that the coal commission probably will attempt to draw up a code in which will be set forth the rights of the employer and the rights of the employee. He also stated that the help of several associations had been solicited to make a study of furnace design, flue design and other problems incident to the use of a wider range of fuels for domestic purposes.

Government Must Pay Market Price for Coal Requisitioned, Supreme Court Rules

The Navy Department did not pay a just price for coal it requisitioned from the New River Colleries Co. at Hampton Roads, between Sept. 17, 1919, and Feb. 1, 1921, according to a decision rendered by the U. S. Supreme Court, May 21, which sustained decisions of lower courts awarding additional compensation to the company. The decision was read by Associate Justice Butler.

Acting under Section 10 of the Lever Act, the Navy Department requisitioned some 60,000 tons of coal which belonged to the New River Colleries Co., between the dates mentioned, offering the price fixed by the President. The company accepted 75 per cent of the amount offered and entered suit in the U. S. District Court of New Jersey for a greater amount, contending that the market price was higher than that offered by the government. A jury in the District Court awarded a judgment for an amount in excess of that offered by the government, and this judgment was affirmed by the Circuit Court of Appeals.

In sustaining this judgment, the Supreme Court declared: "The United States had the right to take the coal on payment of the market prices prevailing when and where the coal was taken; the owner was not entitled to more and could not be required to take less." The opinion affirms the finding of fact by the lower courts that the market prices at Hampton Roads for spot export coal were higher than the price offered by the government in settlement, and that the spot price, with an active market, should have controlled rather than the domestic future price which the government had attempted to introduce. Efforts of the government to introduce evidence of "real value" in contradistinction to "market value" were properly ignored by the lower courts, the opinion stated.

Hammond Warns Not to Expect Too Much in Anthracite Report; Pepper to Advise on Royalty Regulation

By Paul Wooton
Washington Correspondent of *Coal Age*

Anthracite coal, in the opinion of John Hays Hammond, chairman of the President's coal commission, is paying a disproportionate freight rate. In making that statement, Mr. Hammond was careful to point out that the railroads must be allowed to earn reasonable profits, but he does believe they are collecting charges on anthracite coal which are out of proportion to the charges levied on other commodities. The fact that anthracite traffic originates in a comparatively small area and does not require the construction of additional sidetracks and can be concentrated easily in full trainloads should be reflected in the freight rate, Mr. Hammond believes. He also called attention to the fact that there are great differences in favor of anthracite in the cost of handling bituminous and anthracite coals. He admitted that the commission is considering a recommendation that the cost of service be made the basis for computing freight rates on anthracite.

Publication in the daily press of Mr. Hammond's statement in regard to anthracite rates gave rise to inquiries as to how soon a reduction might be expected. This led to a request that publication be made of the fact that no one should delay purchase of coal in the hope that a lower freight rate will be available in the near future. In that connection, attention was called to the fact that even should the commission vigorously recommend such a rate reduction, this does not mean that the Interstate Commerce Commission will act on the recommendation, and even should it be disposed to embark upon a new study of anthracite coal rates, many months probably would be required for the hearings and other formalities in connection with such an investigation. The coal commission is anxious that the public understand that there is no prospect of any rate reduction for a year at least and no promise of a reduction at any time.

In sounding this note of caution, the commission has in mind the heavy losses which came to some consumers who delayed purchases of coal awaiting the much heralded reduction in the rates on bituminous coal last year.

Drafting of Anthracite Report Not Under Way

The commission has conferred at length with the independent anthracite operators but no important new facts were brought out, Mr. Hammond stated. Much the same ground was covered as was the case when the company operators met with the commission. One of the interesting phases of the discussion, Mr. Hammond stated, pertained to methods of selling. He gave no details. There also was discussion of the possibility of improving methods of conciliating labor disputes. The operators have a variety of ideas but all admit that there is no easy solution for any of the problems that the anthracite producers are facing. The commission has been advised that the report of the anthracite committee will be forthcoming in the near future and will be confined largely to constructive suggestions.

No portion of the anthracite report has been drafted as yet, Mr. Hammond asserted. The commission are reaching no conclusions since they have at their disposal returns covering only 30 per cent of the anthracite production. The rate at which replies to the questionnaires are being received will accelerate rapidly from this time on, he predicted. It leaked out at the conference that Senator Pepper is the "distinguished Pennsylvania lawyer" who will report to the commission in detail as to the possibility of exercising regulation over the matter of royalty. His report will simply review the Pennsylvania statutes that would have a bearing on that practice.

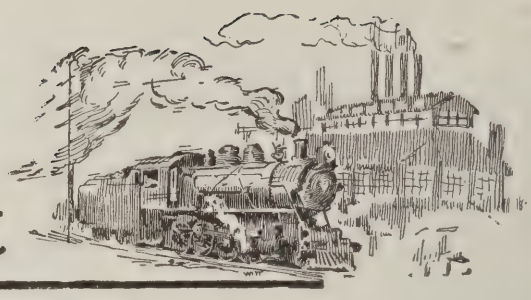
Mr. Hammond cautioned against expecting too much in the anthracite report. The problems of anthracite are overlapping and it will be difficult to reach conclusions before all of the questionnaires have been tabulated. For that reason, he believes, the real results of the commission's work will be embodied in its final report, although he expects the anthracite report to contain much more "substance" than the preliminary report issued Jan. 15.

The commission is making headway in its study of relationships between the producers and the anthracite carriers and the bearing these relationships have on the price paid by the ultimate consumer. The reports on this work are being made by Professor Hollander and his assistants. Mr. Hammond emphasizes the importance of determining questions of valuation and capitalization before intelligent estimates as to reasonable profits can be made. The advisory committee on valuation plans to report June 15. It is Mr. Hammond's opinion that no additional questionnaire will be required in connection with arriving at fair valuations, as practically all of the information required is covered on the questionnaire already sent out.

That the Interstate Commerce Commission has been urged by the Coal Commission to expedite its consideration of the coal rates in the Northwest, was admitted by Mr. Hammond. He expressed the earnest hope that the existing uncertainty could be removed. From his remarks could be deduced that Mr. Hammond is of the personal opinion that the people of the Northwest should enjoy the benefits incident to water transportation and that the economies represented in the lake movement of coal should be encouraged.

In this connection it may be said that there is some opposition among coal specialists in Washington to any attempt on the part of the Coal Commission to advise the Interstate Commerce Commission. The coal rate structures are delicate pieces of mechanism with which the Interstate Commerce Commission is quite familiar after long experience in efforts to keep them adjusted. Since Congress is prone to act on transportation matters without full knowledge of the intricate questions involved. some fear that a recommendation from the Coal Commission as to an adjustment of anthracite rates would have far-reaching consequences. There also is a feeling that the Interstate Commerce Commission rather resents some of the suggestions which have been made to it in regard to its handling of matters concerning coal. There is doubt whether any constructive service can be performed in suggestions to that body on matters pertaining to coal rates.

New Haven Road Lifts Embargo Limiting Anthracite Shipments to New England



The New York, New Haven & Hartford R.R. announced May 18 that it had lifted all embargoes on east-bound freight, including the limitation of anthracite shipments to New England, which had prevailed since the fuel shortage of last winter. The order removes the regulation of anthracite through the Campbell Hall Gateway, near Poughkeepsie, which limited to 100 cars a day the amount to be accepted from connecting roads. Removal of the congestion which afflicted all Eastern roads last winter, improvement of equipment and the more equable distribution of freight along the lines made it possible to lift the embargo, said New Haven officials. The summer demand for anthracite in New England has already set in, they reported.

Anthracite Miners Call Wage Convention

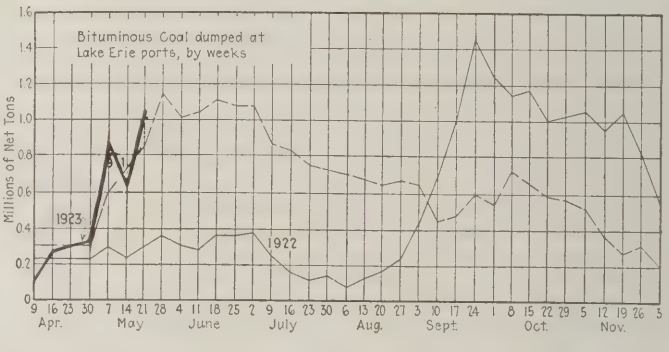
The anthracite mine workers, through their district boards, according to a news despatch from Wilkes-Barre, are to hold a convention at Scranton on June 26 to formulate new demands to take the place of the present wage agreement, which expires Aug. 31. Details of the demands to be formulated were not forthcoming.

Production and the Market

Weekly Review

A feeling of confidence pervades the coal trade. Spot prices are comparatively easy but there is a decided firmness in the contract market. Current output is easily absorbed, the demand for domestic sizes of anthracite and for high-grade steam bituminous coal being avid. Contracting is going on quietly at good prices. So long as smokeless commands around $4 in Western markets the tidewater supply will be short, especially with the limited car supply offered by the N. & W. and C. & O.

Production of soft coal continues above 10,000,000 net tons weekly with car supply somewhat easier. Output of anthracite for the first four months of 1923 was 33,931,000 net tons, the largest recorded production for a like period and 21 per cent above the average for the same period of the last nine years. April production was 8,063,000 net tons, exceeded by the corresponding month in 1914, 1915 and 1918, but 14 per cent above the April average for the last eight years.

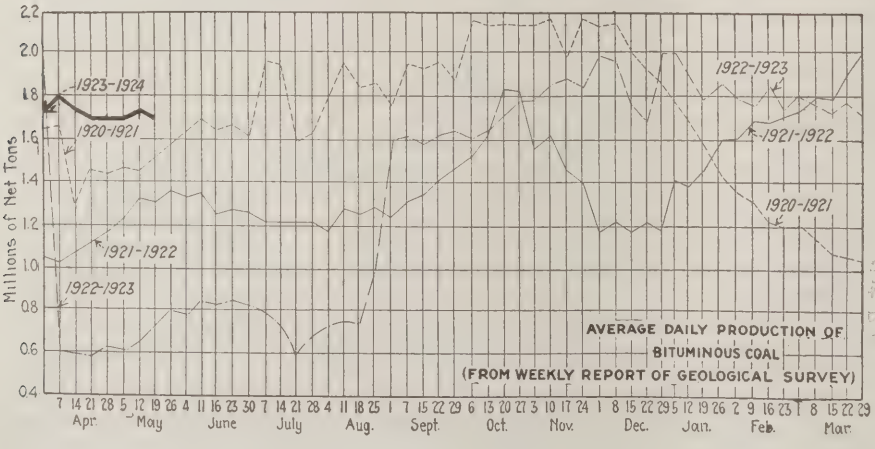


Spot prices for soft coal declined last week, *Coal Age* Index dropping 5 points to 221 on May 21. The average price was $2.68. Pocahontas, Pittsburgh, Mount Olive and Springfield recorded advances and Clearfield, Somerset, Cambria, Kanawha and Standard showed decreases in prices.

Demand Improves in Middle West

There was a slight improvement in demand for domestic sizes in the Middle West. Dealers were slow in stocking but were buying some because an increase of 25c. per ton is scheduled to go into effect on June 1. In the East there has been no material change. Although the New Haven lifted its embargoes on anthracite there remain numerous local embargoes in New England that interfere with deliveries.

The export market remains quiet. During the first twenty days of May 19 ships carrying 182,973 tons of cargo coal left Baltimore, as compared with 170,000 tons during the corresponding period of April. Thirteen of the foreign trade vessels loaded 13,602 tons of bunker coal, making total dumpings at Baltimore to April 20 196,575 tons. Of this amount, 19,432 tons went to South America. During the week ended May 14 two cargoes of coke aggregating 8,518 tons went to France.



Lake navigation is now in full swing. Anthracite and bituminous coal is moving to the Head-of-the-Lakes in good volume; receipts at Duluth-Superior during the first five days of the season were approximately as large

as was unloaded during the first 17 days of the season last year.

"The recent gradual decline in soft-coal production was checked in the second week of May," says the Geological Survey, "when, according to preliminary estimates, the output increased to 10,211,000 net tons, a gain of 150,000 tons over the revised estimate of the week preceding. Preliminary reports of cars loaded during the first half of the week May 14-19 indicate a continued production at the rate established the week preceding and a probable total of 10,200,000 tons."

Dumpings at Hampton Roads for all accounts during the week ended May 17 were 333,977 net tons, a decrease of 35,025 net tons from the previous week.

Calendar year	2,493,000	7,227,000

(*a*) Subject to revision. (*b*) Revised from last report.

Domestic sizes of anthracite keep moving, but the steam coals are accumulating. Considerable of the larger coals are going into Canada and the Northwest. Prices for independent coal remain around $11 with concessions to those buyers who take steam sizes as part of their order.

Midwest Gets a Little Trade

A slight movement of domestic sizes has begun throughout the Middle Western coal fields. Dealers all over this section of the country are hesitant about stocking, but they are nibbling a little because of the 25c. increase scheduled to go into effect June 1. After that date another two weeks of low market is expected before real summer buying sets in. By July 1 coal-wise men think business will have picked up considerably. Midwest steam trade continues slow, as might be expected with the market in its present condition. Central Illinois, where production came almost to a full stop a week ago, had so few screenings available that some sold up to $2, while in southern Illinois where are many storage piles, they sank below $1.75. Now, however, there is little Southern to be had at less than $1.75, because most producers decided to hold on rather than continue giving coal away. Most mines still have loads of all sizes unbilled on tracks.

Duquoin, Jackson County, Mt. Olive and Standard fields are all acutely inactive except in cases of mines with mine-run contracts. Standard 2-in. lump is quoted $2@$2.15, and smaller sizes at just what they will bring. Screenings at $1.50 are about the only coal moving.

St. Louis Stirs Slightly

Household trade in St. Louis was stirred up a little during the past week by newspaper accounts of the probable coal difficulties of next season. Domestic demand from the country was unaffected, however, and the steam trade is dull. Anthracite, smokeless, and a little Arkansas semi-anthracite get most of the buyers though there is little Arkansas in the city. Apartment-house storage of Standard 2-in. lump is starting at prices from $4.50 up. Cut-throat competition is troubling the trade.

Kentucky Has Its Troubles

The State of Kentucky and surrounding regions are pretty well filled with distress coal just now. This is mainly the result of the reopening of western Kentucky mines that were on strike until two weeks ago. Such a rush for business

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 221, Week of May 21, 1923. Average spot price for same period $2.68. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

followed the resumption of work that most coals in the state have been selling off. There is much bemoaning the fact that Lake trade does not seem to be drawing heavily enough from Kentucky.

Some state and local contracts for the season show eastern Kentucky screenings at $2.25 and mine-run at $2.40 while western Kentucky screenings have been signed up at $1.50@$1.85 f.o.b. mines. Already western Kentucky distress screenings have sold as low as $1.25@$1.35. Car supply is the best it has been for months.

Northwest Exerts Itself

A concerted and intense selling campaign is going on throughout the Northwest. The docks at the Head-of-the-Lakes have reduced soft-coal lump and mine-run prices to a point where they can undersell Illinois coal an average of about 28c. at Minneapolis and St. Paul and are striving mightily to regain lost business. They have lost little if any on the dock stocks carried over because most of the coal was screenings, price of which has held above cost and is not softening noticeably. Anthracite, at last year's prices, is moving well into the upper Lakes inland region.

Around Milwaukee the first spurt of business marking the opening of the Lake season has not subsided and coal concerns are scratching hard for business. The big May rush prophesied by many did not appear. Retailers feel no demand from consumers and big consumers are hesitant about contracting just now.

West Feels Better

Two things seem to portend better days for the Southwestern field. Early orders for threshing coal are beginning to trickle in, and already there is a noticeable increase in the sale of storage coal. Still, mines are working only one or two days a week, and the Southwest has a long way to go before it will be out of the desert.

The retail price of domestic sizes, cut several weeks ago to encourage storing, has not yet been raised, although the prediction then was that it would advance 50c. in May and 50c. a month until September.

Railroad business in Utah is a little better and steam coals generally are improving so that Utah screenings sell now above $1.75. Domestic trade is dormant, however. The 50c. reduction to encourage storage by householders has had little effect. Northern Pacific Coast trade has livened a shade but Utah mines still average only about two days a week running time.

In Colorado a light snowstorm and accompanying cool weather have combined to sell some coal. Steam trade has shown more effect of this than has domestic. Quotations on the slow sizes have lowered a little.

Ohio Consumers Play Waiting Game

The situation in Ohio is quiet. At Columbus buying continues at a low level, as large consumers apparently are playing a waiting game. Purchasing agents for the larger users are not anxious to close contracts, believing that low prices will prevail for the greater part of the summer. Public utilities and railroads are the largest buyers, although some contracts are being made by iron and steel concerns.

Cincinnati dealers believe that buyers in Michigan, northern Ohio and Indiana are waiting for an indication that the bottom has been reached before entering good sized orders. Railways are believed to be getting ready to make purchases, it being reported that one carrier within the next few days will place an order that will result in the withdrawal of between 50,000 and 60 000 tons from that market. The majority of steam coal users in the Cleveland market are still looking to the open market for their coal and have not yet made contracts for their requirements.

There is a somewhat more hopeful feeling among operators in the Pittsburgh district as to the future of the market, based upon the expectation of car shortages. Demand for coal is not expected to improve to any great extent soon, though the Lake demand has room for much betterment. The present dullness in central Pennsylvania is attributed, in a measure, to the high production of the first four months of this year.

Conditions in the Buffalo market are quiet. Demand is light, although general business is good.

New England Consumers See Auguries

While in New England there is no material change in the current market there are indications of a different attitude on the part of buyers. A succession of embargoes affecting traffic through all the gateways is bringing home to the consumer the possibilities later on. It is realized that sometime during the fall and winter the railroads will reach the peak of ton miles and that probably long before that time there will be a shortage of equipment and corresponding congestion on the through lines.

All-rail from central Pennsylvania quotations are unmodified. A few producers of high-grade coal have about concluded they have all the spot business required to keep mines in operation the balance of May and are again turning their attention to contracts over periods of six to ten months. Transportation conditions have made it difficult to figure available tonnages, but more than a few operators feel they will have less trouble placing output the next three months than has been the case since February.

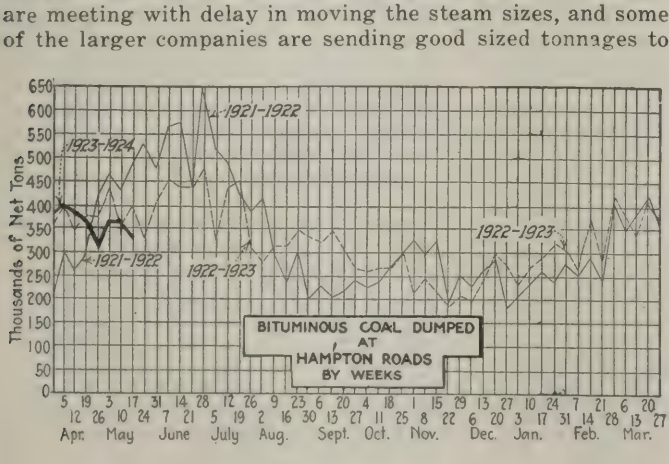
Hampton Roads prices rule reasonably firm at a $7 level for Navy standard coal, with an occasional sale of No. 2 grade at $6.75 or less. The smokeless districts continue on

less than 50 per cent output, but it is of some interest to note that the shortage is now attributed to lack of railroad facilities rather than to a restricted market. Occasional export inquiry helps out the spot market, but due to the flood of Pennsylvania coal offered at New England points there is only very light inquiry for Pocahontas and New River for distribution inland. On cars Boston, Providence, and Portland quotations are still $8@$8.25. A few market cargoes furnish surplus enough to keep prices easy on about that range.

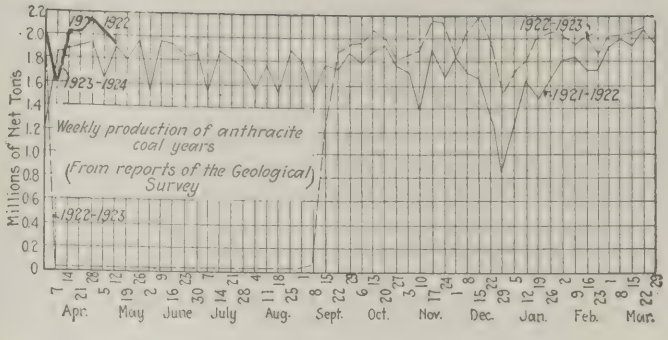
Movement via the Philadelphia piers continues in good volume. A few steamers ordinarily plying to Norfolk and Newport News have been noticed loading at Port Richmond, and to an extent this is a development of some interest. Some of the coal moved is of course anthracite, due to the great pressure to get domestic sizes forward, but much the heavier proportion is steam coal, both high and low volatile, for use at plants in New England adjacent to tidewater. Congestion all-rail has been sufficient to make the water route a matter of decided interest among certain buyers.

New York Market Notes Slight Improvement

A slight improvement in buying was noticeable in the New York market. Inquiries increased and there was an apparent tendency on the part of consumers to "cover" themselves. There are many loaded boats in the New York harbor and some sales of distressed coals at low prices were made. The market at Philadelphia continues quiet with no evidence of a sustained demand. Demand centers around the high grades. At the coal docks there is little activity and clearances show a decrease. There has been little change in the Baltimore market with regard to steam and gas coals. Industries are buying in the open market. The gas-coal market is sustained in part by the export demand.



Inquiry from industrial sources at Birmingham is light and there is an accumulation of all grades of coal. The coke market has shown some weakness. Domestic coals are still in active demand.



Lake Movement Gains Headway

Of the 90 cargoes of coal shifted to the docks at the Head-of-the-Lakes before May 14 8 were anthracite. United States Steel Corporation vessels, which usually make the first trip of season empty, carried coal this year to the D., M. & N. Railway. Receipts at Milwaukee during the first half of May aggregated 97,929 tons of anthracite and 319,281 tons of bituminous. During the week ended May 21 Lake dumpings amounted to 988,794 net tons of cargo coal and 46,072 net tons of fuel coal, making the dumpings for the season 3,365,063 net tons of cargo coal and 140,349 net tons of fuel coal.

Demand for Domestic Anthracite Holds Up

There has been no letup in the demand for the anthracite domestic sizes. Egg and stove coals are the shortest in the New York market but there is no surplus of either chestnut or pea sizes. Dealers in Philadelphia are being delayed in filling orders because of the continued cool weather. There is a fairly heavy movement of barges from Port Richmond to various New England ports. Producers are meeting with delay in moving the steam sizes, and some of the larger companies are sending good sized tonnages to

storage. Demand at Toronto is heavy, due to weather conditions. Orders are being received as fast as retail dealers can fill them, although receipts are slightly larger than they were several weeks ago.

"The production of anthracite in the week ended May 12 decreased 6 per cent in comparison with the production in the week preceding," according to the report of the Geological Survey. "The nine principal carriers of anthracite reported loading 36,387 cars, from which it is estimated that the total output, including mine fuel, local sales and the product of dredges and washeries, was 1,903,000 net tons. The decrease appears as the result of holiday observance on Ascension Day, when mine production was cut to about 43 per cent of the average for the other days of the week. Preliminary reports of loading during the week May 14-19 indicate a somewhat lower daily rate of production."

Beehive Coke Output Declines Further

Production of beehive coke, which declined somewhat during the first week in May, showed a further small decrease in the week ended May 12, says the Geological Survey. On the basis of the number of cars loaded by the principal coke carriers the total output is estimated at 403,000 net tons, a decrease of 4,000 net tons when compared with the previous week's production. The decline was all in the Pennsylvania district with small gains in the Middle and Southern Appalachian states.

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

Foreign Market And Export News

British Production Declines Slightly; Some Collieries Sold Ahead

Production of coal in Great Britain's mines took another drop during the week ended May 5, when the output was 5,325,000 tons, according to a cable to *Coal Age*, as compared with 5,721,000 tons the week previous. The decrease was due to May 1 being largely observed as a holiday.

Some collieries in South Wales are reported as being heavily booked for deliveries well into June, with little coal available for prompt or early delivery.

Orders placed include heavy bookings for the French State Railways, and 100,000 tons of Monmouthshire large coals for South American railways. The latter is on the basis of about 30s. per ton, f.o.b. The Algerian State Railways are in the market for 60,000 to 90,000 tons of patent fuel for delivery between June and November.

Statistics showing exports of coal during the week ended May 19, follow in tons:

	Tons
From the Tyne district	5,850
From the Mersey district	9,995
From the South Wales district:	
To the United States	8,921
To Canada	32,021

Hampton Roads Movement Slow

Movement at Hampton Roads last week was slow, the diversion of coal to the West by rail having cut down supplies to some extent. Vessels did not arrive up to schedule, and all lines of the trade fell off.

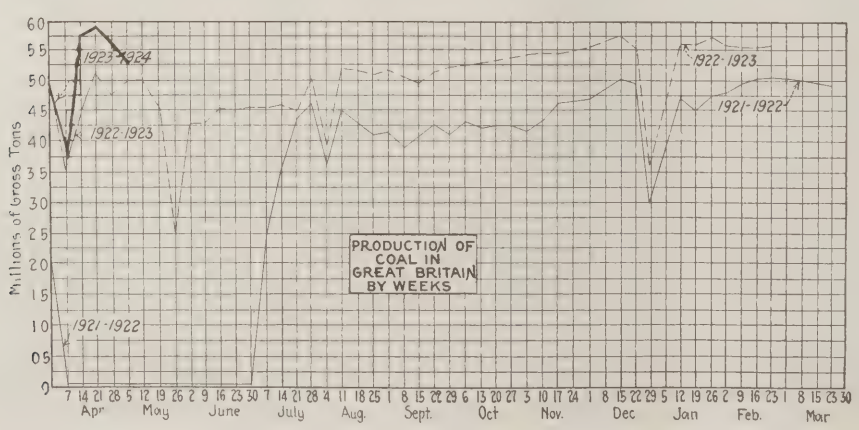
Export business was not up to expectations, while the coastwise trade showed a marked reduction. Bunker business was slightly below the previous week.

The tone of the market was dull, and shippers were not looking forward to any distinct revival in business during the next few weeks. They expect contracts to be asked for about the middle of June, to become effective July 1. The outlook for continued export business, to South America and France, was bright, according to shippers.

Saar Mine Strike Settled

The strike of the 50,000 coal miners in the Saar Valley has been settled according to a press cable received in this country, the men returning to work on May 16 under an agreement providing for an increase in wages ranging from 3 to 5 fr. Soon after the strike began the League of Nations Commission which administers the Saar, according to the dispatch, offered the men an increase in wages, but the offer was refused, the men insisting on their demand that the Ruhr be evacuated. It is likely that it will be at least a month before the first shipments of coal from the district will arrive in France.

French industrial coals are in better supply, although the mines in the Nord and Pas-de-Calais are heavily booked for the May output.



Production during March amounted to 3,012,116 metric tons of coal, 149,285 tons of coke and 262,316 tons of patent fuel.

During March and up to April 20, France received from Germany 76 000 metric tons of coal, 78,800 tons of coke and 6,700 tons of lignite briquets.

Although 109,200 metric tons of Ruhr coke consigned to the Societe des Cokes de Hauts-Fourneaux passed Ehrang station between April 1 and April 30 the French Minister of Public Works has urged French Metallurgists to stock up one-third of the coke they receive from the Ruhr until they have reserves aggregating 250,000 tons.

Production of coke from French collieries ovens is increasing. In the Nord and Pas-de-Calais coal fields it amounted to 97,800 tons in March, as compared with 47,300 tons in October of last year. Out of the March production the Crespin and Douchy collieries supplied to French Metallurgists 28,000 tons and they received from the other collieries about 35,000 tons, the balance going to foundries and other industries. It is expected that by the end of the year the collieries, not including Crespin and Douchy, will be delivering monthly to French blastfurnaces 60,000 tons of coke and by the end of 1924, 110,000 tons.

Two batteries of ovens amounting to 110 ovens are about to be started, while four other batteries are in course of construction, one to be ready in July, one in September and the remaining two toward the end of the year or the beginning of next.

News Items From Field and Trade

ALABAMA

The fifth annual statewide first-aid field meet will be held at Birmingham, July 21, under the auspices and direction of the Alabama Mining Institute and the U. S. Bureau of Mines. A large number of teams from the different mining companies and other industrial plants will participate in the meet, the program of events, prizes, etc. now being in course of preparation.

The first application for a coal lease on public lands in the State of Alabama has been made to the Department of the Interior, affecting 1,840 acres of land located near Carbon Hill, Fayette County. The tract is estimated to contain seven million tons of high-grade bituminous coal, lying in what is known as the "Jagger bed." It is a non-coking coal, but is especially adapted to domestic use, analyses made by the Bureau of Mines showing an average heating value of 12,577 B.t.u. Application for the lease has been made by a coal company of Memphis, Tenn. Should this company be the successful bidder it agrees to pay to the federal government a royalty of 10c. per ton mine-run of coal produced, guaranteeing a production of 20,000 tons per annum beginning with the fourth year and obligating itself to invest $25,000 per year during each of the first three years in coal-production plant and equipment. The coal-leasing privilege on this land will be sold by the Interior Department under the above conditions some time in June to the bidder offering the highest cash bonus at public auction at the land office at Montgomery. The exact date of this auction will be announced within the near future.

ILLINOIS

The Rentchler mine of the Missouri-Illinois Coal Co., at Rentcher, Ill., **has been ordered closed** by State Mine Inspector James R. Richards. The company has been ordered to equip the airshaft with a ladder. The company has also been instructed to increase the amount of air pumped into the mine.

The mine of the **Jeffrey Coal Co.** at Herrin **suffered a loss by fire** recently when the **timbering in the shaft was almost totally destroyed.** The timber was new, the mine having been shut down some time ago for the purpose of retimbering the shaft and the work had been completed to within a few feet of the surface.

Governor Len Small told the Illinois legislative investigating committee last week that neither he nor Adjutant General Black nor Colonel Sam Hunter ought to be blamed for not sending state troops to stop the Herrin massacre of June 22, 1922. He blamed the sheriff and county authorities of Williamson County and said that, judging from the reports furnished him, right up to the morning of the slaughter of 21 non-union miners by a mob there was no need for troops. The committee has found that many of the important witnesses it wanted to call from Williamson County have "disappeared" and probably will stay out of sight until adjournment of the Legislature, when the committee's authority ends.

A. C. Linberg has joined J. M. Crom in representing the **Cement-Gun Co.** in the Chicago district. Mr. Linberg, formerly with Fred T. Ley Co., Inc., and with the Thompson-Starrett Co., has had wide experience in sewer and dam construction. The Cement-Gun Contracting Co. is now taking contracts not only for Gunite work, but also for the building of reservoirs, dams, levees and the like.

Too many mines and too much labor trouble are the most serious afflictions of the soft-coal industry, according to Conrad B. Spens, vice-president of the Chicago, Burlington & Quincy R.R. and formerly Federal Fuel Distributor, writing in the *Illinois Journal of Commerce*, the publication of the Illinois Chamber of Commerce. Soft-coal production increased 37 per cent between 1910 and 1920, Mr. Spens says. While in that period the railroads increased their coal-car tonnage 42.5 per cent they were obliged to divide their cars among 6,800 more mines in 1920 than in 1910. With fewer mines there would be better transportation and with fewer labor troubles there would be continuous production, Mr. Spens said.

INDIANA

The Bankers Trust Co., of Indianapolis, receivers for the Steele-Kattman Coal Co., has announced that all creditors of the defunct company are required to file their claims with the receiver on or before June 1.

The Joan Collieries Co., an Ohio corporation, has qualified to do business in Indiana with a capital stock in this state of $50,000 as represented by the stockholders. David E. Rowland, a well-known coal man of Terre Haute, has been named state agent.

The Wabash Coal & Oil Co. of Terre Haute, has filed a final certificate of dissolution. **The Glendale Coal Co.,** also of Terre Haute, has filed a similar document with the Secretary of State.

Contracts for providing the 1923-24 coal supply to Indiana state institutions, 140,775 tons in all, **have been awarded** by the State Purchasing Committee to the **Tope Coal Co.** and **Ogle Coal Co.,** both of Indianapolis; **Walter Bledsoe Coal Co.,** of Terre Haute, and **Ayrshire Coal Co.,** of Oakland City, according to Fred B. Robinson, secretary of the committee. One or two small contracts yet may be made, but the great bulk of the supply is covered by the deals just completed. The contracts call for $2.40 a ton for mine-run Indiana No. 4 shaft coal; $2.05 for No. 4 screenings; $2.65 for egg size; $1.25 for 4-in. screen; $1.90, pea and slack, No. 5 coal, and $2.20 washed pea and slack, Mr. Robinson said. The prices are to prevail until April 1, 1924, when miners are to negotiate with operators for a new wage scale.

A drop in coal prices for the summer months has been announced by most of the dealers in Evansville. It is expected similar decreases for summer delivery will be made now in most of the cities of that section of the state. **Prices quoted at Evansville are:** Lump coal, 20c. a bushel; nut coal, 20c.; mine-run, 18c. During the winter months the prevailing price for lump and nut coal was 23c.

Two practical coal miners and two experienced coal operators were appointed members of the **Indiana State Mining Board by Governor McCray** in organizing the new State Department of Mines and Mining which was created by the last session of the General Assembly. The mine inspection work of the state was formerly a division of the state industrial board. John Hessler, of Terre Haute, president of district No. 11, United Mine Workers of America, and William Mitch, of Terre Haute, a miners' official, were appointed as the coal miners on the new state board. William Johnson, of Vincennes, and John A. Templeton, of Terre Haute, are named as the coal operators. Mr. Hessler and Mr. Johnson were appointed for two years, while Mr. Mitch and Mr. Templeton will serve for four years. Cairy Littlejohn has been appointed chief mine inspector by the Governor. Mr. Littlejohn has been state mine inspector under the industrial board.

Articles of incorporation for the Indiana Coal Merchants' Service Bureau, Inc., of Indianapolis, which is composed of the membership of the Indiana Retail Coal Merchants' Association and which will give statistical and other service to its subscriber members have been filed with the Secretary of State. The bureau was capitalized at 100 shares of no par value. Directors are: R. R. Yeagley, secretary of the coal dealers' association; Martha A. Yeagley and Frank D. Roberts. The establishment of the service bureau was decided on at the final session of the spring convention of the association in April in Indianapolis. Annual meetings of the subscribers to the service bureau will replace the conventions of the association.

KENTUCKY

Announcement was made at Hazard May 4 of a contract let for the **construction of a Whitesburg to Harlan roadway, connecting the Hazard and Harlan coal fields by road.**

J. E. Johnson has succeeded the late Richard V. Hord as secretary of the Hazard Coal Operators' Association.

MASSACHUSETTS

The special Massachusetts Legislative Commission appointed to investigate the coal situation **held its first session** on May 10 at the State House in Boston. Congressman Treadway, the first witness, declared that New England is the subject of discrimination as in favor of longer hauls. He suggested an investigation of the question of royalties, noting particularly the Girard estate, and also raised the question of profits accruing to independent companies. The questions of standards of quality and of substitutes were suggested as subjects which might yield valuable results upon close investigation. As to government ownership, he declared himself decidedly opposed to any such plan. The coal dealers declared that the new pure coal law is responsible for some shippers refusing to send coal here. B. Preston Clark, of the Associated Industries, declared that the situation here is chaotic and that there is now a great shortage of coal, which ought to be relieved as speedily as possible.

MISSOURI

A controlling financial interest in the **Devoy & Kuhn Coal & Coke Co., of St. Louis, has been acquired by Chas. A. Wall and associates.** Mr. Wall is chairman of the board and his son, W. P. Wall, president of the firm. S. W. Innes and J. Weinberg, appointed as vice-presidents, will have charge of sales and purchases.

NEW YORK

The Webster Mfg. Co. of Chicago announces the appointment of **Robert T. Pierce as manager of the company's New York sales office** at 90 West Street. He succeeds the late Glen N. Porter, whose death occurred March 31, 1923.

Emil Greenberg, chairman of the Bath Beach Community Council, Brooklyn, has sent a letter to President Harding, asking that **action be taken "which will insure for the future an uninterrupted supply of coal** to the public at reasonable prices." The letter declares that the coal operators "deliberately created a shortage," that "rubbish from the culm piles" was sold by "the coal barons and profiteers," and that much suffering resulted.

Sealed proposals will be opened by the Superintendent of Lighthouses, Staten Island, 2 p.m., May 28, 1923, for approximately 3,100 tons of bituminous steam coal during July, August and September, 1,800 tons trimmed in vessels' bunkers as required under coal chute New York Harbor; 300 tons for vessels at New London, Conn., and 1,000 tons delivered in 500-ton lots by barge alongside Lighthouse Depot, Staten Island. Information on application.

PENNSYLVANIA

Thirty-two ovens at the Farrell byproduct coke plant of the Carnegie Steel Co. **have been fired up** after a two-year shutdown. The remaining 182 will be charged as soon as possible.

Two hundred applicants took the examination for second-grade mine foremen at Cresson during the second week in May before an examining board of which Joseph Williams, mine inspector of Altoona, was the chairman.

Fifteen tracts of coal land, in addition to those purchased recently, have been acquired by the Pennsylvania Coal & Coke Corporation in northern Cambria County. The entire deal is said to involve the expenditure of a million dollars.

The washery and tipple of the Keystone Coal & Coke Co. at Salemville **was destroyed by fire** May 5, causing damage estimated at $100,000. It was announced that coal mined at Salemville would be taken by an underground route to the Huron plant of the company and that it would be put through the washery at the latter place and then returned to Salemville to be made into coke.

Examinations were held in Johnstown during the second week in May by the state mining board, composed of Nicholas Evans, inspector; George W. Wilkes, operator, and Robert Joves, miner. A total of 128 miners took the examination for second-grade mine foremen, one of the largest classes ever examined in Johnstown. The 6th, 24th and 30th districts were represented.

George W. Wilkes, superintendent of the Eureka mines Nos. 30, 31, 39 and 40 of the Berwind-White Coal Mining Co. for the past seven years, has tendered his resignation. Mr. Wilkes is a mine superintendent of wide experience, beginning his work in England 47 years ago, and working in western and central Pennsylvania for thirty years. He will remain in Windber.

Twenty ovens at the Grace plant of the Corrado-Schenck Coke Co. at Moyer **were recently overhauled and fixed up after an idleness of more than a year.** Coal will be supplied from a new opening, a sufficient quantity being available to keep the operation running for some time. The plant, built and operated for many years by W. J. Rainey, was acquired by the Corrado interests about two years ago.

The bill compelling anthracite companies to sell coal to churches, schools and charitable institutions in the communities where the coal is mined, has passed the Senate and is now in the hands of the Governor. The bill is the outgrowth of Olyphant's experience last winter, when the Hudson Coal Co. refused to sell coal to keep the schools and churches open. The citizens answered this by confiscating several cars of coal that stood on a siding.

Future polices of union labor in Somerset County are difficult to determine since Judge John A. Berkey granted an injunction the equity suit filed by the Quemahoning Creek Coal Co. against officers and individuals of District No. 2, United Mine Workers. Two hearings were held and the injunction continued indefinitely. Union activities are prohibited in the Quemahoning field and the final decision doubtless will determine action of other non-union operating companies in the Somerset County field, of which there are many.

Representatives of organized labor appearing before the Senate Judiciary General Committee May 9 **urged passage of the amendments to the Workmen's Compensation act** sponsored by Senator Joyce, Luzerne, whose bill would increase the maximum weekly compensation from $12 to $16 and the number of weeks during which compensation would be paid for disability. Opposition to the measure failed to materialize at the meeting, but it was stated by a member of the committee that anthracite and bituminous operators would file briefs with the committee, setting forth their objections to the bill.

An accident, probably due to an air blast, at the No. 10 colliery of the Lehigh Coal & Navigation Co., near Lansford, May 4, **resulted in three men being killed and six injured,** one of them seriously. J. B. Warriner, general manager of the company, stated that the first reports that the accident was due to a gas explosion are not true as far as the preliminary investigations have disclosed. There was a rush of air in a new level at the No. 10 colliery that flung the men about, one sustaining a fractured neck, another a fractured skull, a third was badly bruised and lacerated. The other men also report that there was a terrific rush of air that lifted them from their feet and threw them down. The source of the rush has not been determined, it being impossible to penetrate to the top of the breast, where they were at work, to complete the investigation.

Five hundred men at the Buttonwood colliery of the Lehigh & Wilkesbarre Coal Co., near Wilkesbarre, **went on strike** on May 14 following a dispute over the quality of blasting powder furnished by the company. **The men returned to work on Wednesday.** Four hundred men at the Laurel Run colliery of the Hudson Coal Co. went on strike when one union man was discharged. The total loss of output in both strikes is 1,500 tons daily.

The Wilkes-Barre City Council agreed May 15 to draw up an agreement and **execute a lease for the sale of the coal under the river common to** James J. Powell, a Scranton attorney, at his bid of 52c. per ton.

Governor Pinchot on May 10 approved the bill of Representative John R. Post, Washington County, relieving life tenants of land from the payment of taxes on the underlying veins of coal which they have no right to operate. The new law, which is the first of the series of coal bills before the Legislature to be signed, provides that such coal shall be assessed to and the taxes paid by the owner of the veins of coal.

More than 1,600 miners employed by the Jeddo-Highland Coal Co. in the Hazelton district walked out May 14 **in protest against the company's refusal to advance the hour of paying off** so the men will not have to stand around in wet clothes waiting for their money. The company announced that no concessions would be made and that the matter will be taken to the Anthracite Conciliation Board. They claim that under the eight hour day the miners should not finish work until 3:30 p. m. The men announced that they will tie up all the collieries every pay day until the change is made.

Another big transaction in coal lands involving over 1,000 acres has just been put through in Cambria County. The price is said to be $1,000,000. **The holders of the Davis-Long Coal Co. in Cambria township have just been sold to J. H. Weaver,** of the Ebensburg Coal Co., which already has a large acreage now under operation at Colver. This is the territory that was the cause of considerable litigation between the Davis-Long company and Charles N. Blanchard, of Binghampton, N. Y. The new owner will open a mine and start a new town several miles west of Ebensburg.

The Davis and the Fowler mine-cave bills in the House Committee on Mines and Mining probably will follow the series of other bills before the Legislature this year which have as their object the return of part of state taxes to the municipalities in which they are collected. With the collapse of the taxation program in the House there is little chance, if there ever was any, for a return of moneys collected for state purposes to their source. The mine-cave bills provide for a return of a portion of the anthracite tonnage tax to coal producing municipalities for general purposes for the repair of damages caused by mine caves. Representative Fowler and Representative Whiteman, chairman of the House Committee on Mines and Mining, saw Governor Pinchot about the bills on May 15 and the Governor told them that in view of the lack of finances he could not see how he could sign the bills if they reached him.

Shipments of anthracite during April, 1923, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,173,774 gross tons as compared with 7,183,518 gross tons during the preceding month of March, a decrease of 1,009,744 gross tons or 14.06 per cent. This decrease is partly due to fewer actual working days during the month of April and to operations being almost entirely suspended on the Eight-hour Day, April 2. Continued button strikes also contributed to the decreased production. Comparison with the month of April last year cannot be made on account of entire suspension of operations pending new wage agreement, which was signed Sept. 11, 1922. Shipments by originating carriers were as follows:

	April 1923	March 1923
Philadelphia & Reading	1,170,925	1,370,476
Lehigh Valley	1,088,783	1,279,599
Jersey Central	508,683	622,710
Dela., Lackawanna & Western	906,203	1,146,217
Delaware & Hudson	851,960	907,099
Pennsylvania	527,139	542,167
Erie	647,707	818,817
N. Y., Ontario & Western	146,985	192,247
Lehigh & New England	325,389	304,186
Totals	6,173,774	7,183,518

One of the largest hearings of the present legislative session was held May 9 on the Smith and McNichol bills aimed at stopping further stream pollution. The Senate Health and Sanitation Committee held the hearing and speakers of the bill included representatives of water companies, conservationists, sportsmen and state officials of the Health Fisheries and Labor and Industry Departments. F. D. Patterson, representing the Manufacturers' Association; Charles O'Neil, secretary of the Pennsylvania Coal Operators' Association; James Campbell, chemist for the Frick Coal & Coke Co.; Clayton Snyder, Pittsburgh steel interests, and J. N. Chester, Pittsburgh, opposed the bills. They contended they are unnecessary, for chemists of the coal and steel companies are working on filtration plans to stop pollution. The Smith bill prohibits pollution of all streams not now contaminated, while the McNichol measure prohibits pollution of water supplies at their source.

UTAH

The U. S. Land Office at Salt Lake City has been directed by the Secretary of the Interior **to offer for lease two tracts of public coal land** in Utah, one containing 400 and the other 440 acres. The land is in Sevier County about 40 miles northeast of Richfield and is accessible to the branch of the Denver & Rio Grande R.R. running from Salt Lake City to Marysvale. Lease for each tract will be at a government royalty of 10c. per ton for coal mined, a minimum investment in mining operations of $35,000 during the first three years of the lease, and a minimum production of 12,000 tons of coal a year beginning with the fourth year of the lease. The sale of the leases will be made by public auction at the Salt Lake City land office on a day to be fixed later. Privilege will be given to bidders to obtain one lease covering both tracts.

It has been announced that the **Utah Fuel Co.'s coal camps in Carbon County will all make connections with the Utah Power & Light Co.'s high-tension lines for power service.** This is taken to indicate that the much discussed plan to build a central power plant near Price to generate electric power with local screenings for fuel has been abandoned.

VIRGINIA

Trial of suits aggregating nearly half a million dollars filed by the Norfolk & Western Ry. against coal companies which have agencies at Norfolk, for alleged demurrage charges over a varied period running back nearly to the war, **will begin in the City Circuit Court at Norfolk, May 25.** The railroad claim for demurrage is denied by the companies, which charge that the railroad assessed demurrage on improper schedules. The companies which are defendants in the suits, and the amounts in each case, are: Panhandle Coal Co., $3,286 28; Nottingham & Wrenn Coal Co., $15,000; C. H. Sprague & Co., $58,129.28; Smokeless Fuel Co., $21,870.28; Raleigh Smokeless Fuel Co., $17,636.50; Dexter & Carpenter, $1,990; West Virginia Coal Co., $2,183.06; Jewett, Bigelow & Brooke, $46,320; Algonquin Coal Co., $124,012.62; Eastern Coal & Export Corp., $29,409.66; George E. Warren Corp., $2,072.20; Matlack Coal & Iron Corp., $8,640.26; William-Cory-Mann-George Corp., $8,826.02; Kentenia Coal Co., $242.14, and Fort Dearborn Coal & Export Co., $5,219.82.

WEST VIRGINIA

The Horse Branch Coal Co. and the **Black Diamond By Product Coal Co.** have been dissolved as corporations.

The following West Virginia coal concerns have increased their capital stock in the amounts given: Raleigh-Wyoming Coal Co., from $3,500,000 to $4,100,000; **Elm Grove Mining Co.,** from $2,000,000 to $2,400,000; **Hite-Barns Coal & Coke Co.,** from $200,000 to $300,000; **Mordue Collieries Co.,** from $750,000 to $1,250,000; **Fort Grand Coal Co.,** from $100,000 to $500,000.

The United Workmen Collieries Co., organized under the laws of Delaware, has been authorized to transact business in West Virginia.

A jury in the Federal Court of the Southern District of West Wirginia has **nullified the claims of C. L. Stickel to the lands owned by the Big Laurel Coal Co.** in Boone County. The case was an action in ejectment, Stickel claiming title to the land. The case is one of those involved in the government case now pending against a number of defendants in Omaha, Neb.

Another mine will soon be opened by the Pocahontas Fuel Co. in the Wyoming County field, not far from the Itmann mine in Wyoming County, on the line of the Virginian Ry. It will be necessary for the Virginian to extend its line in order to afford shipping facilities. There are about 2,000 acres in the tract, which the Pocahontas Fuel Co. will begin to develop. The company is making extensive improvements at Pocahontas, having begun the erection of a number of dwellings for the use of company officials and the clerical force of the company.

The Fairmont & West Virginia Coal Co., which was recently organized by Robert Y. Brown and others **will have offices in Fairmont,** New York, Pittsburgh, Cleveland and other cities. Opening of the offices in Fairmont follows the recent purchase of the Shadybrook mine of the Banner Coal Co. on the line of the Western Maryland in the Fairmont region. The company will have as its local representative, it is understood, Harry MacAlarney of Ebensburg, Pa. A. L. Black is to be the superintendent of the Shadybrook mine, the capacity of which will be increased by numerous improvements and the installation of much new equipment.

By agreement between counsel representing the state and the defense, **the trial of C. Frank Keeney,** president of the District 17 United Mine Workers; **Fred Mooney,** secretary-treasurer of the same organization, and **William Blizzard,** president of sub-district 2 of District 17, **will be begun in the Circuit Court of Greenbrier County at Lewisburg, on June 18,** that date having been fixed May 19 by Judge Summers H. Sharp. Keeney, Mooney and Blizzard were indicted for complicity in the armed march against Logan and Mingo counties in the fall of 1921 and are now charged with being accessory to the slaying of several Logan County deputies during the outbreak of 1921. Judge Sharp has continued the term of Circuit Court in Greenbrier County for the purpose of trying the defendants.

The Helmick bill creating the West Virginia School of Mines has been approved by the Governor. The new law creates a school of mines to be on the same footing with the school of arts and sciences and other schools at the West Virginia University. It provides that there shall be a department of mining engineering, mining geology, chemical engineering, mining extension, etc., and that a suitable staff of instructors as well as a dean shall be appointed. The new law also provides that a suitable building shall be erected. The location of the new school of mines has not been definitely determined upon, that being left to a commission of five members to be appointed by the Governor.

In the list of West Virginia concerns whose capital stock has recently been increased are: **Long Coal Mining Co.,** of Clarksburg, from $50,000 to $200,000; **Bear Run Coal Co.,** from $5,000 to $25,000; **Coal River Collieries Co.,** from $2,000,000 to $2,500,000; **Standard Thacker Coal Co.,** from $25,000 to $150,000; **Vulcan Coal Co.,** from $50,000 to $200,000; **Smith Pond Creek Coal Co.,** from $50,000 to $150,000.

The Middle West Coal Co. has reduced its capital stock from $200,000 to $53,750, and the **Aetna Sewell Coal Co.,** from $2,000,000 to $1,000,000.

A compromise has been reached out of court **in the suit between the Matthew Addy Steamship and Commerce Corporation and the Raleigh Smokeless Fuel Co.,** which was being tried in the federal court for the southern district of West Virginia and in which $464,000 in all was involved as a result of the suit and counter suit. The Matthew Addy Corporation had instituted suit for damages to the amount of $364,000 for alleged breach of contract and on the ground that the Raleigh company had failed to make deliveries according to contract. The Raleigh Smokeless Fuel Co. also had a suit against the Matthew Addy Corporation pending in which damages were asked in the sum of $100,000 for alleged failure to accept the delivery of coal.

Following a visit of Colonel C. W. Watson, president of the Consolidation Coal Co., to that company's properties embraced in the New River-Pocahontas division, it became known that **improvements costing about $5,500,000 are contemplated.** The properties to be improved are located in McDowell County and were acquired a few months ago. Since the Consolidation took over the smokeless properties in southern West Virginia it has been engaged in making many improvements and in maturing plans for further improvements, all with a view to increasing the capacity of mines.

The Atlas Coal & Coke Co., of Chicago, of which L. Romanski is president, has opened an office in the Masonic Temple Building, Charleston, with E. W. Tildesley in charge. The tidewater and Western business of the company will be handled through the new office.

The Elkland Coal Mining Co., which has headquarters at Columbus, Ind., will soon increase the capacity of its mine on the Charleston division of the B. & O. by the installation of a larger tipple, scales and shaker screens. It is hoped to double the output soon. D. C. Hitt, of Columbus, is president and I. D. Lyons, of Columbus, secretary and treasurer.

WASHINGTON, D. C.

I. W. W. interests will soon be operating a coal mine in this state, judging by the fact that Elmer Smith, of Centralia, an I. W. W. leader, has filed articles of incorporation for the Smith Coal Co. to operate a mine near Mendota. The company is capitalized at $18,000.

During the absence in Europe of George S. Rice, chief mining engineer of the Bureau of Mines, and until further notice, **James W. Paul will be acting chief mining engineer,** with headquarters at Washington. **C. A. Herbert is detailed to Pittsburgh to serve as acting chief coal mining engineer,** beginning June 1 for a period of five months, and will report through the superintendent of the Pittsburgh Station to Mr. Paul. He will have immediate charge of the Experimental Mine work and other coal-mining investigations, except the coal waste inquiry for the U. S. Coal Commission, which work will be handled directly by Mr. Paul. **H. I. Smith will continue as mining supervisor** and will report through the Assistant to the Chief Mining Engineer on administrative matters, consulting with the Acting Chief Mining Engineer on technical matters.

The U. S. Bureau of Indian Affairs, Department of the Interior, **invites bids on approximately 46,100 tons of bituminous coal and 2,100 tons of anthracite** for the use of the Indian Service during the fiscal year ending June 30, 1924. Bids will be opened 2 p.m., June 4. Schedules giving all necessary information will be furnished upon application to the Indian Office, Washington, D. C., or the U. S. Indian Warehouses at Chicago, St. Louis and San Francisco.

CANADA

The Princeton Coal & Land Co., which owns extensive coal areas near Princeton and much real estate in that city, **is being taken over by Yorkshire and Lancashire coal mining interests,** and in future is to be operated on a much more extensive scale. F. W. Glover, who has been superintendent of the mine for many years, has been made general manager. The company has been in operation for some years, and last year it produced close to 20,000 tons of coal. The coal is unusually high in volatile combustible matter, average analyses running 44 per cent volatile, 50 per cent fixed carbon and 5 per cent ash. The sulphur content averages about 0.5 per cent.

At a recent conference Mayor Macguire told the Toronto coal dealers that if they could not guarantee that there would be no shortage of fuel as there was last winter **the city would go into the coal business again.**

Four thousand miners in the Glace Bay coal fields voted May 18 **to call a strike if the provincial police make further raids upon the homes of the United Mine Workers** in their search for seditious literature. The arrest of any of those whose homes already have been raided also would be the signal for a strike, it was said.

Denial of an agreement between the Canadian National Railways and the Canadian Pacific Ry. **fixing an early summer rate of $9 a ton on coal** from points in Alberta to Toronto was made by E. P. Mallory, of the C. N. R., before the Mines and Minerals Standing Committee at Ottawa. A net cost of $9.90 for handling coal from Lethbridge, Alta., to Toronto was given by W. B. Lannigan, general freight traffic manager of the C. P. R., in testimony before an investigating committee.

In a report just issued by the fuel investigating committee of the Engineering Institute of Canada on the fuel situation throughout the dominion it is stated **"that the American anthracite must be regarded today as 'luxury' fuel** in that a high price is paid for acquired habits of use. Welsh anthracite and metallurgical coke, particularly, are much better fuels in that they give more heat for less money, are easy to handle, and have very little ash."

Association Activities

Monongahela Coal Association

The Monongahela Coal Association at its May meet in Morgantown, W. Va., not only made arrangements to be officially represented at the National Coal Association gathering in Atlantic City on June 19, but also discussed informally some of the problems affecting the Monongahela Valley coal region. President John H. Jones, who recently negotiated a merger of a number of coal companies in Pennsylvania and West Virginia, and Secretary C. D. Junkins are to be the official representatives of the association to the National Coal meeting.

Smokeless Coal Operators Association

At its meeting in the Waldorf-Astoria Hotel in New York on May 10, the Smokeless Coal Operators' Association gave its attention to transportation. Looming up at no distant date, it was stated, is an effort of Pittsburgh and Ohio operators to bring about changes in present freight differentials on West Virginia coal in so far as shipments to the Great Lakes are concerned. If such a move should be successful, it was the impression at the meeting, it would place a discriminatory rate against West Virginia shippers of 36c. per ton and would prevent the industry in West Virginia from moving any coal except that which could not be obtained elsewhere. Among those present were Messrs. Caperton, Collins, Crocket, Deyerle, Ellison, Farrell, Fobes, Gross, Houston, Higgins, Jones, Johnson, Koepler, Lawton, Machnicht, Lewis, Morfit, Phillips, Tams, White, Burrows, Adams, McKee and Wolfe. President Robert H. Gross acted as chairman of the meeting. George Wolfe, secretary of the Winding Gulf Association, was the secretary.

Obituary

Archibald MacDonald, widely known in Glace Bay, B. C., died at his home there May 14 after an illness that lasted nearly three years. He was 73 years old. Born at River Dennys, Mr. MacDonald at an early age went to the Glace Bay district, where he worked for the past half century as a miner in various collieries throughout the district.

Eastern Kentucky operators were very sorry to hear of the sudden death at Lexington, Ky., of **Richard V. Hord,** 45, of Lexington, who for five years or more was secretary of the Hazard Coal Operators' Association until he resigned on account of ill-health about the first of this year. Death on May 7 was due to a stroke of paralysis on the 5th. Mr. Hord was a native of Mason County, and for years had been active in eastern Kentucky coal circles. He had some holdings of his own, principally undeveloped properties.

Thomas Hudson, for thirty years a district mine inspector in Illinois, died at the St. Francis Hospital, Kewanee, May 7, at the age of 77 years, lacking fifteen days. Though always of a rugged strong constitution, Mr. Hudson's health had been failing for some time previous to his being taken to the hospital two weeks before his death. He was born in England, May 22, 1846, but came to this country more than fifty years ago, forty of which he has been a resident of Galva, which was his home at the time of his death. For the past three years he served the state as a member of the Mine Investigating Committee. Mr. Hudson was a charter member of the Mine Inspectors' Institute of America and held the office of treasurer of the Institute for three years following its organization in 1908. Taking a deep interest in politics, he served his home town as Mayor and Alderman. Mr. Hudson is survived by his wife and six children, all of whom were present at his bedside when he died. He had a large circle of mining friends.

Traffic News

The petition asking for authority to continue rates on bituminous coal from mines in the State of Ohio to certain points in Indiana, without regard to the fourth section, will be considered at an Interstate Commerce Commission hearing in Pittsburgh, May 28.

The Colorado and New Mexico Coal Operators' Association has assailed the freight rates from producing districts in Colorado and Northern New Mexico, alleging that they have been made without reference to any set plan or system, are full of inconsistencies and are being subjected to constant changes, arbitrarily made, without regard to the rights of producers in other districts. The association declares that its members have been subjected to unlawful discriminations and excessive charges and that it is necessary that the Interstate Commerce Commission establish maximum and minimum rates from the various competing districts in that territory. The association insists that each producing district be given full advantage of its geographic location so as to prevent rate wars and discriminations and give stability to the rate structure involved.

On account of embargoes via other routes and to prevent diversions, **an embargo was placed May 11 by the Boston & Maine R.R.** on all carload freight from the Rutland R.R. at all junctions for movement to or via the Boston & Maine, except carload freight originating on the Rutland, livestock, perishable and railroad supplies, including company fuel.

Members of the Alabama Utility Commission were in session in Birmingham for several days recently **hearing arguments from producers of coal,** ore and other commodities and the consumers of such raw material and the representatives of the several railroads regarding adjustments to be made in freight rates. It is understood that changes carrying in the main reductions in such rates will be arrived at. The discussions hinged for the most part on whether the zoning system of rate-making should remain in force or rates computed on a mileage basis.

The Interstate Commerce Commission has dismissed the complaint of the Little Fork Coal Co., Willard, Ky., in which claim was made for reparation on various shipments of coal on which it was claimed unreasonable rates had been charged.

Reparation has been awarded the C. Reiss Coal Co., to cover overcharges on 134 carloads of anthracite shipped from Pittston, Dunmore and Avoca, Pa., to St. Paul and Minneapolis.

Linn Chapel and Kendall Brothers, retail coal dealers in Elmira, N. Y., **have attacked the rates on anthracite in effect via the Pennsylvania R.R. from points on its line in the Shamokin district to Elmira.** The complainants also **object to the failure of the Lehigh Valley to absorb connecting-line switching charges** at Elmira on such traffic. The commission is asked to prescribe rates of $2.14 and $2.02 per gross ton on this traffic. The present rates are $2.65 and $2.50 on prepared sizes and pea and smaller, respectively.

Operating, mining and production managers from mines in southeastern Kentucky gathered at the Hotel Sinton, in Cincinnati, on May 15 to **take action in opposition to the move made by operating companies of Ohio and Michigan to remove the lake differential from the outer crescent.** Some West Virginia operating men were present at this meeting also and have signified that they will join the movement. The statement was made that the Interstate Commerce Commission some time ago went fully into the plea of the Ohio and Pennsylvania people for the removal of the differential and decided that this as it stood in favor of Kentucky and West Virginia was eminently proper. It was the consensus of the Kentuckians that the differential should be fought for to the last ditch. Among those present were: Arthur Ellison, of Harlan, F. C. Mahan, of High Splint; Gus Whitfield, of Hazard, R. C. Tway, of Louisville; C. W. Boyd, traffic manager for the Appalachia and Hazard Operators associations, E. L. Douglass and G. W. Creech, of Twila.

An increase in the car supply on the Chesapeake & Ohio was reflected during the first twelve days of May by heavier loadings than during the corresponding days of April, the increase amounting to about 3,500 cars, or approximately 175,000 tons. E. L. Bock, general superintendent of the western general division of the road, said: "There is a gradual improvement showing in all lines of business and while our problem is not more business but more empty cars, the general situation affects us more or less."

Complaint made by the **C. H. Mead Coal Co.** and other coal companies operating **in Raleigh, Wyoming, McDowell** and other counties in southern West Virginia that the rates for power charged by the **Appalachian Power Co.** were unjust, unreasonable and excessive has been dismissed by the **West Virginia Public Service Commission,** before which the case has been pending since Feb. 21, 1922. The coal companies took the ground that in view of reduced fuel and labor costs as well as reduced material costs, the rates charged by the power company were unduly high. The Public Service Commission in dismissing the complaint without prejudice held that the power company was entitled to receive 8 per cent on its investment and that investigation disclosed the fact that the company was not earning more than $25,000 a year over and above 8 per cent on its investment.

Fred M. Sackett and William S. Speed, of Louisville, controlling the Byrne & Speed Coal Co., Louisville, have just closed a deal which has been authorized by the Interstate Commerce Commission, involving the **sale of the Sackett-Speed-owned Black Mountain R.R. in southeastern Kentucky to the Louisville & Nashville R.R. for $300,000.** The road is 8.29 miles long, running from Blackmont in Bell County, on the L. & N., to Puckett's Creek, in Harlan County. The road boasts of one engine and four cars, along with three mines and daily production of 52 cars of coal. It was built during the war period by Dr. W. H. Frost and associates of Fredonia, N. Y., and has outstanding capital of $108,000 and bonds of $300,000, which were acquired by Sackett and Speed in June, 1921. About $100,000 has been spent on improvement since the Louisville interests secured control.

A total of 10,979 new freight cars were delivered and placed in service by the railroads of the United States in April, according to reports filed by the carriers with the Car Service Division of the American Railway Association. This made a total of 50,151 new freight cars that have been placed in service since Jan. 1 this year. During the month of April the roads also placed orders for 8,303 new freight cars, which brought the total number of freight cars on order on May 1 up to 115,756. Of the new freight cars on order, coal cars numbered 46,194. The railroads also placed in service during April 293 new locomotives, which brought the total number installed during the first four months this year to 1,228. Locomotives on order on May 1 numbered 1,956 compared with 1,974 on April 1.

A final effort to save the Chicago, Peoria & St. Louis railroad from abandonment and the cruel mercies of the junk man is to be made by Peoria, Ill., interests. A petition made by New York bondholders that the road be scrapped and sold for its junk value has been bitterly fought out in the Sangamon County Circuit Court in Springfield, Ill., and has been heard by the Interstate Commerce Commission. The commission's order has not as yet been filed in court, but it does not solve the problem of how to keep the road in operation. Shippers who have been served by the road, including three mines, are trying to solve the problem. The C. P. & St. L. has about 180 miles of track with valuable terminal facilities in Peoria, Springfield and Alton. It has spent the greater part of its life in the hands of receivers. Efforts have been made toward a consolidation of the C., P. & St. L. with the C. B. & Q., Sante Fe, C. I. & W., and other systems operating in the territory, but the heavy indebtedness has been too great a deterring factor.

Summer Courses in Coal Mining

Carnegie Institute of Technology, Schenley Park, Pittsburgh, Pa. June 25 to July 20.

School of Mines, College of Engineering, University of Alabama, University, Ala. June 4 to June 30. H. D. Pallister, Professor of Mining Engineering, School of Mines, University, Ala.

School of Mines, Pennsylvania State College, State College, Pa. June 25 to July 28. E. A. Holbrook, Dean of School of Mines, State College, Pa.

Department of Mining, West Virginia University, Morgantown, West Va. June 11 to July 21. A. C. Callen, Professor of Mining Engineering, Morgantown, West Va.

Coming Meetings

The American Wholesale Coal Association will hold its annual convention June 12 and 13 at the Gibson Hotel, Cincinnati, Ohio. Secretary, G. H. Merryweather, Union Fuel Bldg., Chicago, Ill.

Illinois and Wisconsin Retail Coal Dealers' Association will hold its annual meeting June 12-14 at Delavan, Wisconsin. Secretary, I. L. Runyan, Great Northern Building, Chicago, Ill.

Southwestern Interstate Coal Operators' Association will hold its annual meeting June 12 at Kansas City, Mo. General Commissioner, W. L. A. Johnson, Kansas City, Mo.

American Association of Mechanical Engineers will hold its spring meeting at Montreal, Quebec, Canada, May 28-31. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

New England Coal Dealers' Association will hold its annual meeting at Providence, R. I., June 13-15. Secretary, C. R. Elder, Boston, Mass.

National Retail Coal Merchants' Association will hold its sixth annual convention June 25, 26 and 27 at Scranton, Pa., with headquarters at the Hotel Casey.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine-Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will hold its annual convention June 25-29, at Swampscott, Mass. Secretary F. L. Hutchinson, 29 West 39th St., New York City.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

The Electric Power Club's annual meeting will be held at the Homestead, Hot Springs, Va., June 11-14. Executive secretary, S. N. Clarkson, Cleveland, Ohio.

National Coal Association will hold its sixth annual convention June 19-22 at Atlantic City, N. J. Assistant secretary, C. C. Crowe, Washington, D. C.

Retail Coal Dealers' Association of Texas will hold its eighteenth annual convention at Galveston, June 11 and 12. Secretary, C. R. Goldmann, Dallas.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

The Illinois Mining Institute will hold its summer meeting on board a boat on the Illinois River, cruising between St. Louis, Mo. and La Salle, Ill., June 7-9. Secretary, Martin Bolt, State House, Springfield, Ill.

West Virginia Coal Mining Institute has set June 12 and 13 for its annual meeting, to be held at Hotel Waldo, Clarksburg, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment,** Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, MAY 31, 1923 Number 22

Selective Immigration

IF THE immigration quotas of 1890 were restored and employers permitted to recruit their own labor under that quota, well-advised opinion is to the effect that the result would be in the public interest. Under such an arrangement immigration could be drawn largely from the north of Europe. It must be admitted that the government cannot undertake a selective process in a foreign country. Private employers, however, could look up the particular type of skill that they might need and in that way affect the selection of immigrants of the more desirable type.

For instance, this year there has been a great shortage of puddlers at American steel mills. On the other hand, there has been a surplus of this type of skill in Wales. Under the present law where the employer is prohibited from making any arrangement with a prospective employee in a foreign country, it is difficult to induce the average man to come to the United States and take a chance on obtaining employment. Many have not the resources to finance such a trip, yet they would be willing to come if expenses were advanced.

It is believed that any relief from the present immigration law will have to come along some such lines. There is no probability that Congress will take off the lid. Moreover, public sentiment is strongly opposed to any large increase in immigration since it is being learned that the public must take care of the unemployed in the off-peak periods.

A type of immigration and emigration that is coming in for considerable discussion is the interstate and inter-industry flow of labor. It is pointed out repeatedly that in the aggregate the soft-coal mines can spare thousands of mine workers without impairing their capacity to produce ample fuel for industry. The anthracite mines are perennially short handed and the metal mines want more men, as do many manufacturing industries. To meet in part this requirement negro labor from the South is flowing north, but the soft-coal mine worker is not leaving his part-time job in haste.

The reason, of course, that the steel industry, for instance, is short of labor while the bituminous-coal mines have a surplus is that the steel industry does not pay as high wages as does coal mining. Laws of Congress determine or at least set the limits on the influx of labor from across the seas, but economic laws govern the movement within the nation's borders.

It is more important to discuss how excess labor in one place may be induced to take up work where it is more urgently needed than to debate endlessly the question of how and why so many mine workers happen to be attached to the industry. The operators point out that the high wage and possibility of high earnings have and continue to attract men into digging coal, which is a reason suggesting a cure. The mine workers' official spokesmen do not deny this as a reason but merely say that if there are 200,000 excess men at the soft-coal mines it is the operators' fault for giving them jobs—which line of argument gets nowhere.

The bituminous-coal industry attracts men to it because it pays well and to dig coal is to be one's own boss, that is to say, assures money and freedom. For no lesser reason do those from foreign lands crowd to these shores.

Why More Reason In Settling Freight Rates Than Wages?

NO SURER evidence of normal conditions in the soft-coal trade could be had than the many complaints now before the Interstate Commerce Commission for readjustments in freight rates. Southern Ohio has a case before that body in which an increase in the differential between southern Ohio and West Virginia is sought as a direct means of increasing the market for Ohio coal. The operators in Colorado want more leeway on freight rates in the market to the east of them, Kansas seeks more of an edge on Illinois in Missouri Valley markets, Eastern shippers want better rates as compared with Illinois and Indiana into the Northwest, to mention a few of the outstanding cases before the Commerce Commission at this time.

Costs of production and freight rates determine quite rigidly the area in which coal from a producing field can be marketed. When demand and prices fall, orders decline, and with mines working but a few days a week—sometimes but a few days a month—the operators seek to extend their outlets, to get a larger share of the going business. Rate controversies are very expensive, statistical and legal services come high, but no expense is ever spared in waging a fight for lower rates or in defense of existent rates. Operators rally without question around their local associations and meet assessments willingly in the defense of such a cause. An equitable freight rate means a great deal to the life of a coal field.

The rate structure is a complicated affair, yet it is flexible. There are both general advances (or general reductions) and local changes. Inequalities are alleged, proved to the satisfaction of the rate-governing body and changed. Discrimination is prohibited. Through many years there have been evolved methods of ascertainment of such abstract things as density of traffic, earnings per ton-mile, costs and profits on specific transportation services. A great body of statistical record and of opinion has been built up on which contending parties may rely in seeking rate changes. It may almost be said that were a bar to be erected to further efforts to change coal freight-rate differentials, hope would die in the breast of the coal operator.

Yet that is what has happened with respect to that other important factor in the price at which the coal producer may sell his product. Labor represents between 60 and 70 per cent of the cost of mining and putting coal on the railroad cars. In the union fields

the wage rates and working conditions that together determine the labor cost of production have in recent years become solidified. There is no machinery in either the anthracite or the organized bituminous coal fields by which inequalities may be corrected. In the hard-coal region it is by agreement, by the contract dating from 1902, that differentials and details of working conditions have been so crystallized that no change is possible. In the soft-coal regions the union has set its face against any change that is not upward and uniformly applied. There is no present way of bringing to satisfactory negotiation the complaint, either of miners or operators, respecting wages or working conditions if the change desired will alter the earnings of either.

It is true that quite recently certain operators in an isolated field in Washington effected a new agreement with the mine workers' local that changed previously existing differentials and lowered the scale. The change was made, however, without the consent of the International organization. It was so obvious that if the union local had not agreed to what was an apparent necessity the district would have at once been made non-union that common sense prevailed in spite of Indianapolis, and a reduction was agreed to. The instance stands alone.

Now it is not conceivable that the relationships that exist between wages in different fields are perfect; that no improvement of advantage to either party is possible. Quite the contrary, for in 1920 these matters were introduced before the Robinson commission, particularly by the mine workers. The Robinson commission made no awards in this regard but it did recommend a commission within the industry to investigate machine differentials. The advice was never followed. So long as one side—now the United Mine Workers—is so powerful in its field with no organized resistance, there can be no collective bargaining.

It is possible to array facts with respect to discriminatory freight rates and come to a conclusion and force obedience to that conclusion, because there is a tribunal that has control of freight rates. What should be a proper wage rate should be as susceptible to argument and determination by reason as what should be a proper freight rate. The essential difference, of course, lies in the fact that the one is concerned with the wage of capital and the other with the wage of labor. Capital is now subject to the discipline of society; labor is not, although the time may come when it will be. Compulsory arbitration of freight rates came after a decade of discrimination and abuse in the railroad world, none of which could compare in blighting effect with the strikes of labor in 1922.

In the exchange of paper shot between the United Mine Workers and the Special Committee of the Bituminous Coal Operators—which our Washington correspondent advises this week is going over the heads of the Coal Commission—it is boldly proclaimed on the one hand that the cure for labor trouble in the coal industry is to unionize all the mines, while it is plainly intimated on the other hand that the union as a whole should be abolished. Neither, of course, is imminent.

To have industrial peace in the coal industry there must come a will to negotiate and to bargain collectively in every field where the union is a recognized factor. There must also be machinery to conduct negotiations and to enforce the results of the negotiations. The first step is a united front by the operators in the organized fields, for nothing less will force the United Mine Workers again to bargain. The machinery may be either within the industry or outside, as is the Railroad Labor Board. The preference is for arbitration and conciliation within the industry, and if there is to be any suggestion as to how it should be organized and function that suggestion must come from the operators. The question now is whether the Special Committee of Bituminous Coal Operators with its majority of anti-union sentiment can and will frame a constructive proposal for peace in the organized fields and rally the union operators to that plan.

Commodity Exchanges and Public Welfare

THERE is within the administration a powerful influence at work in favor of the produce and commodity exchange. These agencies are regarded as being vital to the continued welfare of many trades. Dealing in commodities on paper is a necessity, it is pointed out. Future trading, where there is actual delivery of the commodity, tends to diminish the volume of speculation in the business. These exchanges provide a hedge which is nothing more than an insurance on price, a very necessary procedure in modern business. Those who put in their time betting on supply and demand do an insignificant amount of economic harm. Even that is offset to a certain extent by the fact that these operators in their keenness make helpful deductions as to probable supply and demand. The sinister influence which is exerted in future trading is the buying of a position and the setting out to make it good. To do this, resort is had to efforts to spread the impression of shortages which do not exist.

These attempts to interfere with the ebb and flow of supply and demand are confined perhaps to 3 per cent of the volume of business done on exchange. Ninety-seven per cent of its operations are in the public interest, yet the 3 per cent brings the whole into disrepute. There is every reason why exchanges should adopt regulations which would preclude such tactics. Had the Chicago Board of Trade listened to public opinion ten years sooner, it might have escaped regulation. The broker has a professional obligation to the buyer and to the seller. He cannot be faithful to those obligations if he speculates on his own account. This is widely known, yet the exchanges have not had the courage to prohibit a certain minority from engaging in the unethical practice of dealing on their own account.

ALASKA WOULD GO AHEAD if the federal government were to get out, many believe. As it is, jurisdiction over the territory of Alaska is divided among 35 different departments and bureaus of the federal government, which represent 135 separate activities. Now that a number of prominent federal officials are planning a march on Alaska, it is hoped that steps will be taken that will give the people of that territory a chance to develop it. There is a large and thriving paper and pulp industry across the imaginary line which separates Alaska from Canada. The industry is largely in the hands of Americans, who are forced out of Alaska by the curious conception of conservation which seems to have as its objective that there be no development anywhere—that water capable of developing power should continue to waste itself on the rocks of its stream bed and that trees should continue to age and fall down.

Panther Creek District Mines Thickest Coal Found In Pennsylvania Anthracite Region

Steep Pitches Make Gravity Underground Loading So Easy That Output per Miner Is High—Maintenance Is Costly — Depth Increases 88 Per Cent in Fifty Years

By Dever C. Ashmead
Kingston, Pa.

THE thickest coal in the Pennsylvania anthracite region is mined in the Panther Creek district and steeply pitching beds make gravity loading underground so general that the output per miner is far higher than that of any other district. However, in spite of thicknesses running up to 200 ft. and averaging 15.87 ft. and in spite of the high average of 641 tons loaded out per day for every miner, the general tendencies of the Panther Creek district through fifty years of mining are about the same as those of the rest of the anthracite region. Beds have been thinned an average of 22 ft., the average depth has increased 88 per cent and production per employee has dropped markedly.

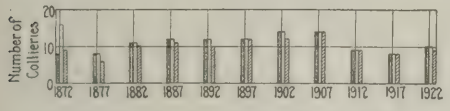

FIG. 50—NUMBER OF COLLIERIES CONSIDERED IN THE CALCULATIONS

This diagram shows the actual number of collieries used in the depth, thickness and tonnage calculations. The first column shows the collieries reporting depth and thickness and the last column in each period shows the number of collieries used in making the tonnage calculations. The center column shows the number of collieries reported by the state mine inspectors in their annual reports. These figures were determined by simply counting the collieries in each case.

The Panther Creek district, for the purposes of this article, is that group of mines in the tip of the Southern anthracite field that lies east of the Schuylkill River together with a few collieries in the same field just across the river to the west. This district includes comparatively few collieries, but data on them is practically complete, as shown in Fig. 50, except for the first period of the last half century. Therefore the figures paint a good picture of what has happened in the past and lend basis for accurate deductions.

TABLE XL—NUMBER OF PANTHER CREEK COLLIERIES IN THIS SURVEY

Years	Reported by Mine Inspectors	Having Depth and Thickness Data	Used in Tonnage Calculations
1872	16	8	9
1877	8	8	6
1882	11	11	10
1887	12	12	11
1892	12	12	10
1897	12	12	12
1902	14	14	12
1907	14	14	14
1912	9	9	9
1917	8	8	8
1922	10	10	9

The same physical characteristics that are found in the Eastern Middle district mark the Panther Creek field, but they are not so pronounced. For this reason the field is considered, geologically speaking, a part of the Eastern Middle field. The Panther Creek district has been subjected to great stresses and a very deep V-shaped basin has resulted. This makes the beds lie on planes varying from level to vertical and in places they are completely overturned. Fig. 51, which is a cross-section in the vicinity of the Lansford Tunnel, shows how steep these pitches are. The section shows the Summit Hill basin in relation to the main basin. The famous Summit Hill mine fire has been burning nearly fifty years in this section.

NOTE.—This is the fifth in a series of articles by Mr. Ashmead describing conditions in the seven sections of the Pennsylvania anthracite region. Previous articles appeared in *Coal Age* for Feb. 22, March 22, April 5 and May 10. The sixth will appear soon.

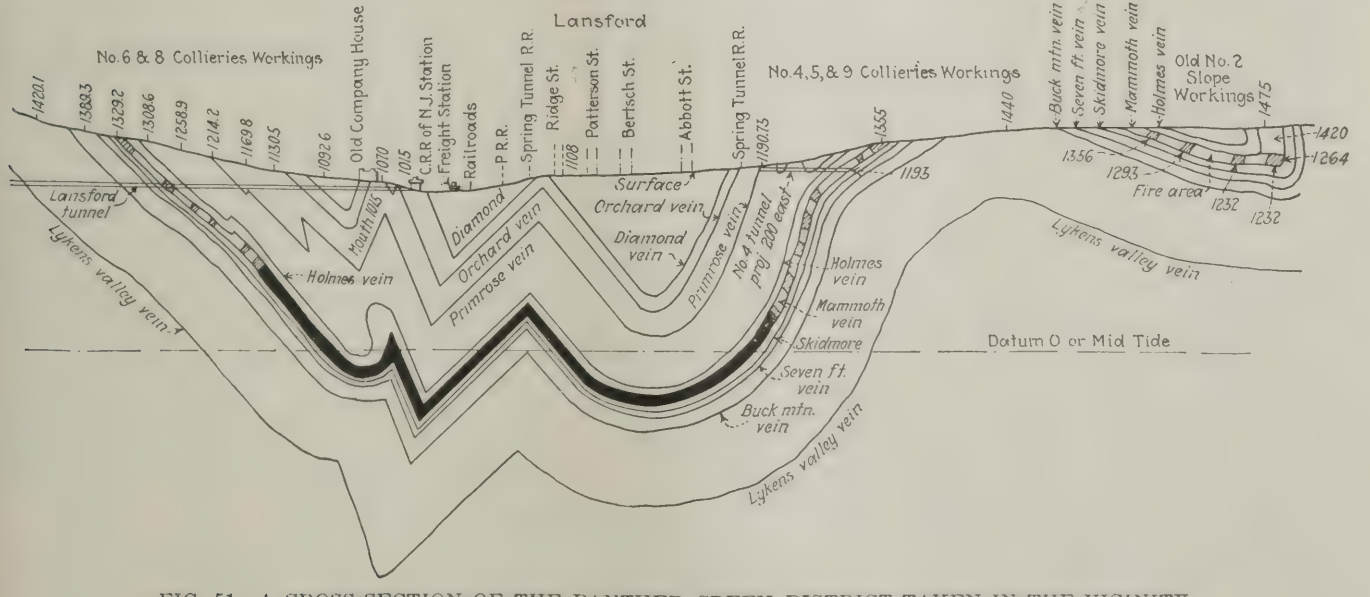

FIG. 51—A CROSS-SECTION OF THE PANTHER CREEK DISTRICT TAKEN IN THE VICINITY OF THE LANSFORD TUNNEL; SUMMIT HILL BASIN ON RIGHT

This cross-section shows the general character of the measures in the Panther Creek district. The beds of coal are generally very steeply pitching and in places they are vertical and lie back on themselves. This complicates the mining.

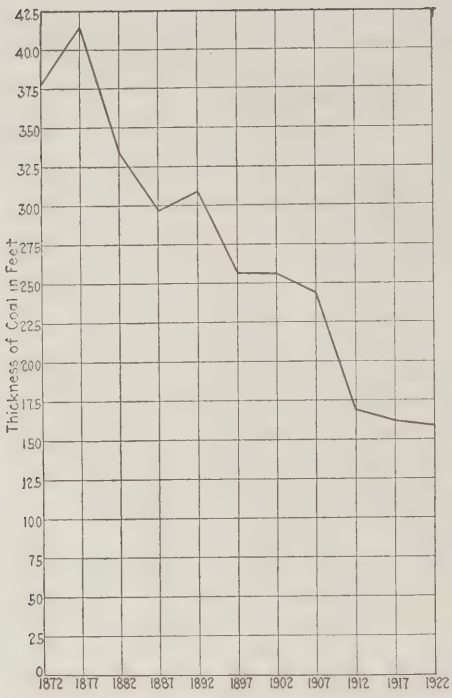

FIG. 52—AVERAGE THICKNESS OF THE BEDS OF COAL IN THE PANTHER CREEK DISTRICT

For the method of calculating this curve turn to Fig. 3 in Part I of this series of articles (*Coal Age*, Vol. 23, p. 324). Table XLI gives the points on the curve.

Some of the coal beds reach their maximum in the Panther Creek district. The Mammoth bed in places is 200 ft. thick and in one place it has been so folded that the two arms of the "V" come together and the total thickness of the bed reaches 400 ft. This coal is now being removed by stripping. Formerly it was mined by the old breast method. In this district, from the surface downward will be found beds in this order: Diamond, Orchard, Primrose, Holmes, Mammoth, Skidmore, Seven Foot, Buck Mountain and Lykens Valley and some smaller beds, which probably are splits of those mentioned. Some of these beds have not been proved to their greatest depth, hence it is impossible to state that they all exist in a workable condition.

Whether these thick beds are assets or liabilities depends entirely upon the mining methods that must be adopted to work each one. A thick bed from which the surface may be removed and the coal mined by steam shovels naturally is a very great asset, but a thick bed which has to be mined by breasts may be a liability, for the cost of the necessary protection of the hanging wall may more than offset every possible economy. The steep pitches and thick beds may mean that serious squeezes may result and areas of coal may be lost or badly damaged.

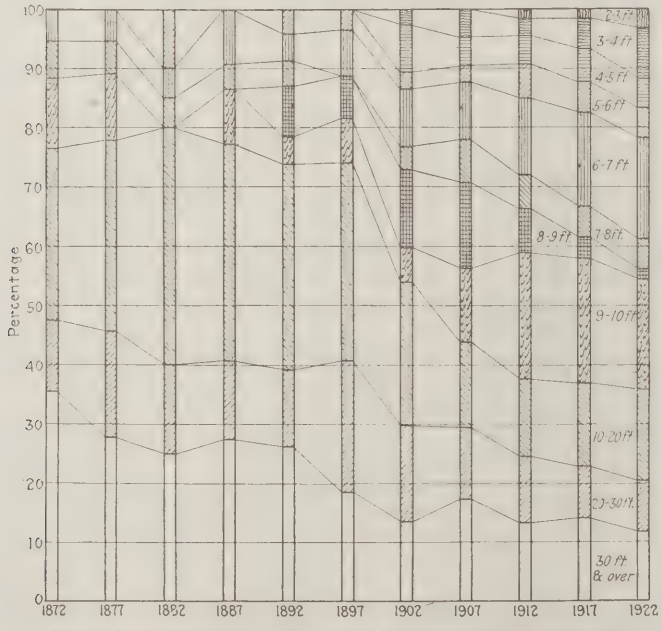

FIG. 53—PERCENTAGE DISTRIBUTION OF BEDS BY THICKNESS IN PANTHER CREEK DISTRICT

TABLE XLI—THICKNESS AND DEPTH AVERAGES FOR PANTHER CREEK DISTRICT

Years	Thickness of Beds	Depth of Workings	Years	Thickness of Beds	Depth of Workings
1872	37.86	337	1902	25.53	634
1877	41.50	445	1907	22.45	569
1882	33.35	468	1912	16.85	534
1887	29.70	475	1917	16.21	589
1892	30.90	507	1922	15.87	630
1897	25.58	616			

In the early days most of the coal was procured from water-level tunnels, and only the cream of the coal in the Mammoth and one or two other beds was taken. The remaining beds were not considered worth going after, as the easily attainable coal was considered inexhaustable. The adoption of anthracite for domestic purposes so increased the demand that the coal companies began to realize the value of the other beds. The old method of taking only the cream of the coal was abandoned; for by that method disturbances of the beds were likely to occur ruining the thinner upper beds by squeezes and causing loss of the coal remaining in the beds under operation. Fig. 52 indicates that in 1872 the average thickness of the coal beds was 37.86 ft. and that in 1887 it had increased to 41.50 ft. It was not until after that period that the thinner beds began to be worked. From 1877 the curve declined rapidly. By 1922 the average thickness had decreased to 15.87 ft. Today, Panther Creek operators work nine beds instead of only the Orchard, Primrose and Mammoth beds, as in 1872.

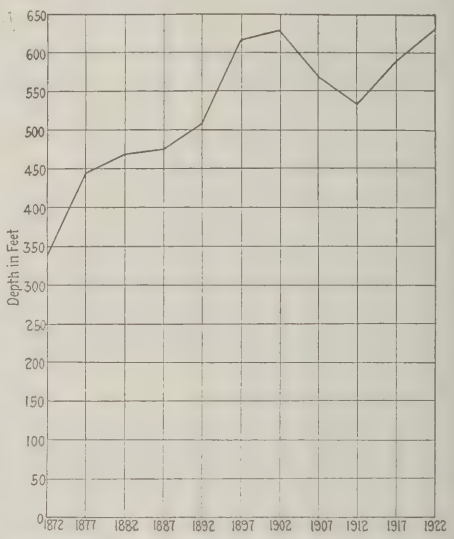

FIG. 54—AVERAGE DEPTH OF WORKINGS IN PANTHER CREEK DISTRICT

By five-year periods commencing with 1872 the weighted average depth of workings in the district is shown. The method of obtaining this weighted average depth is shown in the footnote to Fig. 5 in the first of this series of articles (*Coal Age*, Vol. 23, p. 325). In Table XLI will be found the figures from which this curve was plotted.

In Fig. 53 is shown the proportionate increase of thin beds mined. In 1872 not a single bed less than 6 ft. thick was worked. Those that might be called thinner beds—between 6 and 8 ft. thick—are really splits of much thicker beds according to reports from coal companies and therefore might properly be assigned greater

TABLE XLII—TONNAGE PRODUCED PER BOILER HORSEPOWER AND PER ENGINE HORSEPOWER IN THE PANTHER CREEK DISTRICT

	Boiler Horsepower Installed	Engine Horsepower Installed	Tons of Coal Produced per Boiler Horsepower	Tons of Coal Produced per Engine Horsepower
1877	2,340	3,030	0.88	0.68
1882	3,780	7,611	.48	.24
1887	6,480	.....	.63	....
1892	8,850	.....	.66	....
1897	13,640	.....	0.60	....
1902	17,337	.....	0.48	....
1907	25,389	28,930	0.54	0.47
1912	29,162	38,571	0.48	0.36
1917	17,372	29,209	0.80	0.47
1921	16,123	.....	0.99	....

thicknesses than those given in this paper. In 1872 exactly 76.5 per cent of the beds being worked were more than 10 ft. thick, and this proportion was maintained until 1897. At this point there was a considerable drop, due to the opening of a new colliery working thin beds by modern methods, taking practically all of the coal instead of only working the best beds.

From 1897 the percentage of the thick beds continued to drop steadily and by 1922 this percentage was down to 35.5. Not until 1902 were beds thinner than 5 ft. worked. But by 1912 beds even as thin as 2 ft. were opened. Naturally the character of mining in this district changed materially.

As was to have been expected, the average depth of Panther Creek has increased—88 per cent in fifty years. Workings show a steady increase, according to Fig. 54, until 1902. This increase is from 335 ft. in 1872 to 634 ft. in 1902, or 299 ft. In the period 1902 to 1909 workings averaged shallower for two reasons. New beds were opened at higher levels and new operations at the edge of the district were begun. This same condition applies to the next period. The data indicated that during the labor disturbances in 1902 some of the deeper workings were flooded and therefore work in them was temporarily discontinued. From 1912 to

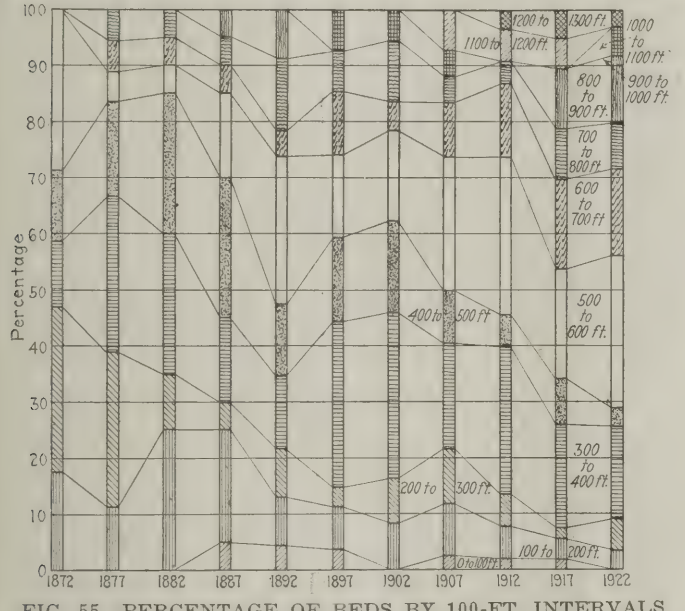

FIG. 55—PERCENTAGE OF BEDS BY 100-FT. INTERVALS

The method of calculating this curve is described in the footnote to Fig. 6 in the first of this series of articles.

1922 the depth of the workings again increased and by 1922 they had reached a mean depth of 630 ft., this being a few feet less than the average depth of 1902.

In Fig. 55 the percentage of producing beds by 100-ft. depth intervals is shown. In 1872 there were no workings below the 500- to 600-ft. interval, but in 1922 only 56 per cent of the beds being mined were as shallow as 600 ft., and the deepest in the 1902 to 1922 period were 1,200 ft. and 1,300 ft. None below 1,000 ft. was worked until in 1907.

What happened in each 100-ft. interval is evident in Fig. 56. Probably the most interesting interval is that of the top 100 ft. Here there has been a considerable increase in the average thickness of the workings due to the opening up of the strippings. The figure shows no workings of this depth for 1922 because active strippings have penetrated as deep as 200 ft. in places though operations at various levels clear up to the surface are in progress.

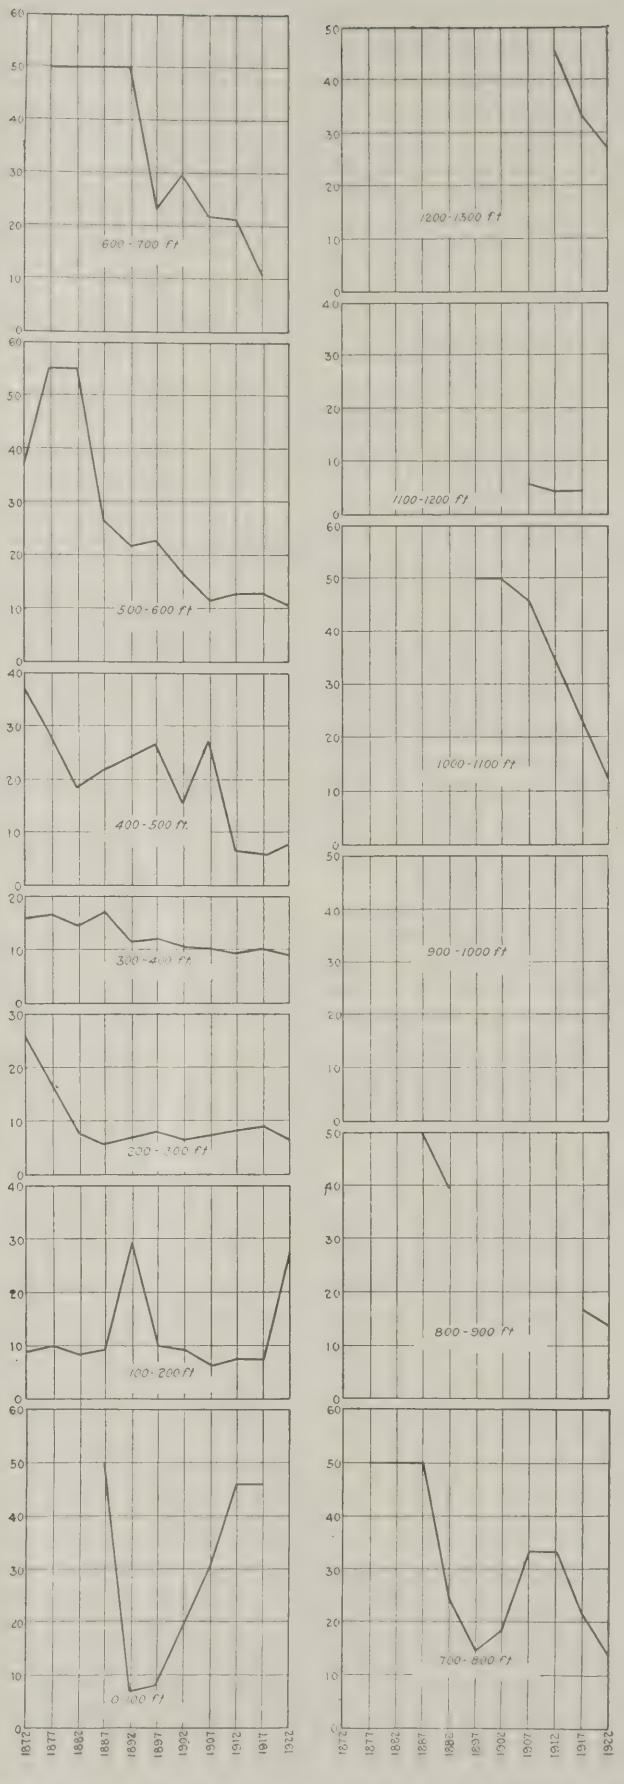

FIG. 56—AVERAGE THICKNESS OF BEDS AT EACH 100-FT. INTERVAL DEPTH BY FIVE-YEAR PERIODS IN THE PANTHER CREEK DISTRICT

The description of the method used to calculate these curves will be found in the description accompanying Fig. 7 in the first of this series of articles. New strippings have made the record for shallow coal show a big increase in coal thickness.

In the Panther Creek district there is a considerable change in the power curve covering fifty years. From 1877 to 1912 the curve shows a slight general decrease in coal produced per boiler horsepower, as might be expected, but in the 1912-1917 period there is a very sharp increase. An increase is also shown in the next period. This does not mean that any less boiler horsepower is required to produce the coal, for the conditions have not improved, and, as has been shown by both the thickness and depth curves, the thickness and depth are both following along normal lines. That is, the thickness of measures is decreasing and the depth is increasing. The explanation is simple. Previous to 1917 the largest company in this district constructed a large central power station and from this station furnished a large amount of the electricity used in the mining of coal. The steam boiler plants at the mines were used to furnish power to such units as were not electrified. The coal company sold the central station to the Pennsylvania Electric & Power Co. and therefore the amount of boiler horsepower installed decreased in the reports to the Pennsylvania state mine inspectors.

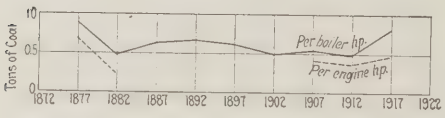

FIG. 57 — CURVE SHOWING TONS OF COAL PRODUCED PER BOILER HORSEPOWER AND ENGINE HORSEPOWER INSTALLED, BY FIVE-YEAR INTERVALS, 1877 TO 1921, IN THE PANTHER CREEK DISTRICT

The full method as to how these curves was calculated will be found in the footnote to Fig. 8 in the article in this series relating to the Lackawanna County district.

A study of the haulage curves in Fig. 58 brings to light some interesting facts. The curve showing the tons of coal hauled per mule per day indicates that in the early period the tonnage hauled per mule is comparatively low. This figure was only 12.5 tons in 1877, 11.1 in 1882 and 9.6 in 1887. In the Lackawanna county district for the same period the figures were 18.0 in 1877, 12.7 in 1882 and 14.9 in 1887. In the Wilkes-Barre district the figures were 20.32 in 1877, 16.30 in 1882, and 15.93 in 1887. In the Nanticoke district in 1877 the mules hauled 19.54 tons a day. In 1882 they hauled 16.27 tons and in 1887, 15.81 tons. In the Eastern Middle field the tonnage figures for the corresponding years are 20.77, 15.10 and 12.56. This shows that in the Panther Creek district the daily tonnage per mule is very low, in many cases amounting to only one-half that of the other districts. This may possibly be explained by the fact that in the earlier years there were a large number of small openings and the coal had had to be hauled by mules from these scattered openings to the breakers. This ran the production per mule per day down.

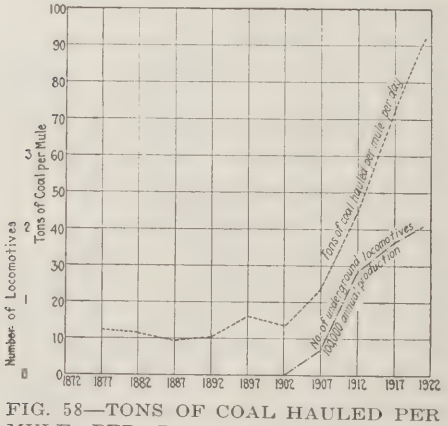

FIG. 58—TONS OF COAL HAULED PER MULE PER DAY AND NUMBER OF UNDERGROUND LOCOMOTIVES PER 100,000 TONS OF COAL PRODUCED PER YEAR IN THE PANTHER CREEK DISTRICT BY FIVE-YEAR PERIODS FROM 1877

Tables XLIV and XLV give the data and the final points shown in this curve. The method of making these calculations is described in the footnote to Fig. 9 in Part I of this series of articles.

TABLE XLIII—MULE AND LOCOMOTIVE HAULAGE IN PANTHER CREEK DISTRICT

Year	Tons of Coal Hauled Per Mule Per Day	Number of Underground Locomotives Per 100,000 Tons of Coal Produced Per Year	Year	Tons of Coal Hauled Per Mule Per Day	Number of Underground Locomotives Per 100,000 Tons of Coal Produced Per Year
1877	12.5	....	1902	13.8	....
1882	11.1	....	1907	23.7	0.37
1887	9.6	....	1912	44.7	1.42
1892	10.8	....	1917	73.7	1.83
1897	16.1	....	1921	90.7	2.03

The figures are extremely deceptive, however, for in this district it is estimated that for every ton of coal hauled one ton of rock has to be hauled. Therefore it is possible that the figures should be increased 100 per cent, which would bring them more nearly in line with those of the other districts. In this district it is possible to calculate the effect of the electric locomotive on the haulage of coal. From the mule-haulage curve in Fig. 58 it is reasonable to assume that if the underground electric locomotive had not been introduced in the earlier years the output per mule by the periods would have been as follows: In 1887, 10 tons; 1892, 11 tons; 1897, 13 tons; 1902, 16 tons; 1907, 19.5 tons; 1912, 23 tons; 1917, 26 tons; and in 1921, 29 tons. If this curve is true, then the tons of coal hauled per underground locomotive in 1907 was 160.6 tons, in 1912 61.6 tons, in 1917, 90.2 tons, and in

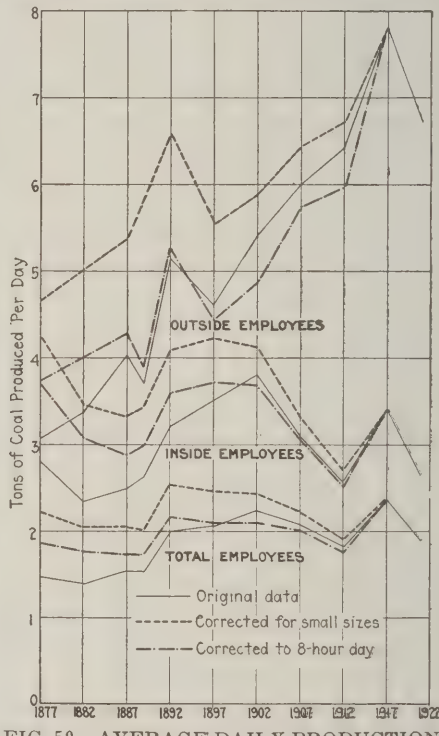

FIG. 59—AVERAGE DAILY PRODUCTION PER EMPLOYEE IN THE PANTHER CREEK DISTRICT, 1872-1921

The solid line represents the actual figures, the dash line gives the correction for small sizes and the dot and dash line gives the final corrected line for the time factor. This bases the output on the eight-hour day in order to make a proper comparison. The methods used in the calculation of these curves is given in the footnote to Fig. 10 in the article in this series that appeared in *Coal Age*, Feb. 22, page 327. The figures obtained for 1897 and 1912 were so far from the average of the curves that it was necessary to check them to see if they were correct. Points were then calculated for the years 1896 and 1898, and for 1911 and 1913 and averaged to obtain the figures for 1897 and 1912 respectively. These figures were then used instead of the actual figures for these years. It was not possible to obtain figures for miners and miners' laborers for the year 1887 for this district, so the year 1888 was used in place of it. This accounts for the extra point appearing in this set of curves.

TABLE XLIV—NUMBER OF MULES AND LOCOMOTIVES IN PANTHER CREEK DISTRICT

Year	Number of Mules	Number of Underground Locomotives	Year	Number of Mules	Number of Underground Locomotives
1877	164	..	1902	601	..
1882	164	..	1907	574	15
1887	424	..	1912	310	59
1892	543	..	1917	189	76
1897	590	..	1921	175	94

TABLE XLV—TONNAGE PRODUCED AND WEIGHTED AVERAGE DAYS WORKED IN PANTHER CREEK DISTRICT

Year	Tons of Coal Produced	Weighted Average Days Worked	Year	Tons of Coal Produced	Weighted Average Days Worked
1877	352,424	180	1902	1,181,170	123
1882	763,883	226	1907	3,563,655	252
1887	1,093,733	203	1912	3,649,717	234
1892	1,358,562	224	1917	4,934,249	290
1897	1,795,404	164	1921	4,125,863	260

1921, 113.8 tons. The amount of rock handled is not included in these figures.

The great effect of the introduction of the locomotive is shown in the number of mules used at the mines. In 1902 there were 602 mules at collieries and by 1921 this number had decreased to 175, though a number of new collieries had been opened, which normally would tend to increase the number of mules used in haulage.

In the lowest set of curves in Fig. 59 there is shown the daily output of coal per employee. The solid line, which represents the actual figures as calculated from the mine inspectors' reports indicates a condition entirely different from any described in previous articles in this series. Here from 1887 to 1902 there is a steady increase in the output per man, then a drop from 1902 to 1921. In this case the figures for 1897 are corrected as explained in the caption to Fig. 59.

This does not tell the whole story, however, for when the curve is corrected for small sizes, which were not shipped in the earliest years, there is a considerable decrease in the output from 1877 to 1889. Then there appears an increase to 1902, and from that date to 1921 a steady decrease, with the exception of the war year, 1917, when the output took a jump. When corrected for the time element, from 1892 to 1921 there is only a slight decrease in the output per man from 2.16 tons in 1892 to 1.89 tons in 1921. There seems to be a step in the curve in 1889, which probably was caused by a change in mining conditions.

Comparing the figures in Table XLVI with those of the previously described districts, it is found that in Lackawanna County district the decrease was from 2.53 tons in 1877 to 1.74 tons in 1921. In the Wilkes-Barre district the decrease was from 2.12 tons in 1877 to 1.48 tons in 1921. In the Nanticoke district the decrease was from 2.56 tons in 1877 to 2.02 tons in 1921 and in the Eastern Middle coal field the decrease was from 2.81 tons in 1877 to 1.95 tons in 1921.

If the figures for the Panther Creek district are accepted for 1877, then there was a production in that year of 1.86 tons per employee as against a production of 1.89 in 1921, thus indicating a slight increase as against a reduction in all of the other districts. This increase probably was due to the consolidation of properties and breakers and the introduction of modern haulage systems which reduce the force necessary to produce the coal.

TABLE XLVI—AVERAGE DAILY PRODUCTION OF ANTHRACITE PER EMPLOYEE, PANTHER CREEK DISTRICT

(In Gross Tons)

Year	Per Total Employee			Per Inside Employee			Per Outside Employee		
	Reported	Corrected for Small Sizes	Corrected to 8-Hr. Day	Reported	Corrected for Small Sizes	Corrected for Small Sizes	Reported	Corrected for Small Sizes	Corrected to 8-Hr. Day
1877	1.47	2.22	1.86	2.81	4.25	3.71	3.07	4.65	3.72
1882	1.38	2.05	1.75	2.34	3.47	3.09	3.37	5.00	4.00
1887	1.54	2.05	1.73	2.48	3.32	2.88	4.00	5.36	4.29
1889	1.53	2.02	1.73	2.61	3.44	2.99	3.69	4.87	3.89
1892	1.99	2.54	2.18	3.21	4.09	3.59	5.16	6.58	5.26
1896	1.91	2.33	1.97	3.29	4.02	3.54	4.26	5.20	4.16
1897	2.44	2.94	2.48	...	...	...	...	...	...
1898	2.15	2.56	2.16	3.74	4.45	3.91	4.95	5.89	4.71
1902	2.24	2.43	2.10	3.81	4.13	3.69	5.42	5.88	4.87
1907	2.08	2.23	2.04	3.09	3.32	3.07	6.00	6.44	5.73
1911	1.90	2.00	1.83	2.71	2.86	2.65	6.22	6.56	5.84
1912	1.69	1.77	1.64	...	...	...	...	...	...
1913	1.76	1.83	1.69	2.43	2.53	2.38	6.59	6.86	6.10
1917	2.37	2.37	2.37	3.41	3.41	3.41	7.82	7.82	7.82
1921	1.89	1.89	1.89	2.62	2.62	2.62	6.72	6.72	6.72

The middle set of curves shows the daily output per inside employee. It decreased from 1877 to 1882, increased from 1882 to 1902 and then decreased again to 1921. Correcting for small sizes and the time element does not materially change the shape of the curve. The curve itself looks like the symbol expressing the cycle in electricity.

In the seventies and the eighties most of the coal was produced from the water level tunnels. In the late eighties more of it came from the deeper workings. The work was more concentrated and fewer men were required and therefore production increased. In 1902 there was a complete overturn in the production. It decreased as far as the curve goes. Later in this series of articles this decrease in production possibly can be accounted for when the general conditions in the regions are discussed. The uppermost set of curves in Fig. 59 shows what has happened to the output per outside employee. Here, with the exception of the year 1892, there has been a steady increase in the production per employee. This was to have been expected, as there has been a number of consolidations of collieries and therefore of breakers, and in some places new breakers have been built. In this district are found some of the most modern breakers in the whole anthracite region. Consolidation of collieries not only reduces the number of breaker employees but also decreases the other outside employees. Greater economies are possible, so there is an increase in the amount of coal produced per outside employee.

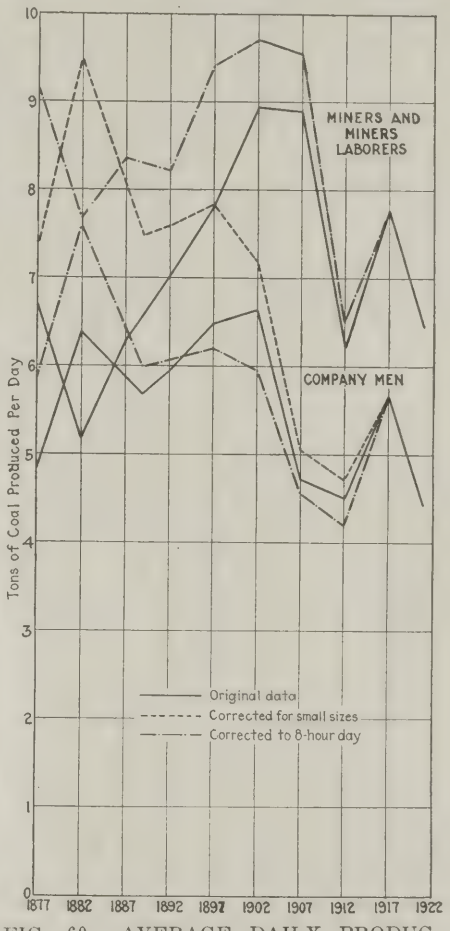

FIG. 60—AVERAGE DAILY PRODUCTION PER INSIDE EMPLOYEE FOR THE PANTHER CREEK DISTRICT, 1877-1921

The methods used in the calculation of this curve will be found in the footnote to Fig. 11, in the first article of this series, which appeared in *Coal Age*, vol. 23, p. 328. The correction for the years 1897 and 1912 will be found in the description to Fig. 59 in this article, as also will be found the reason for the use of the year 1889.

From Fig. 60 it will be observed that the output per miner and miner's laborer decreases to 1882, increases to 1902 and then drops steadily until 1921, with the exception of the year 1917. The increase in production from 1882 to 1902 was in the face of a decrease in the

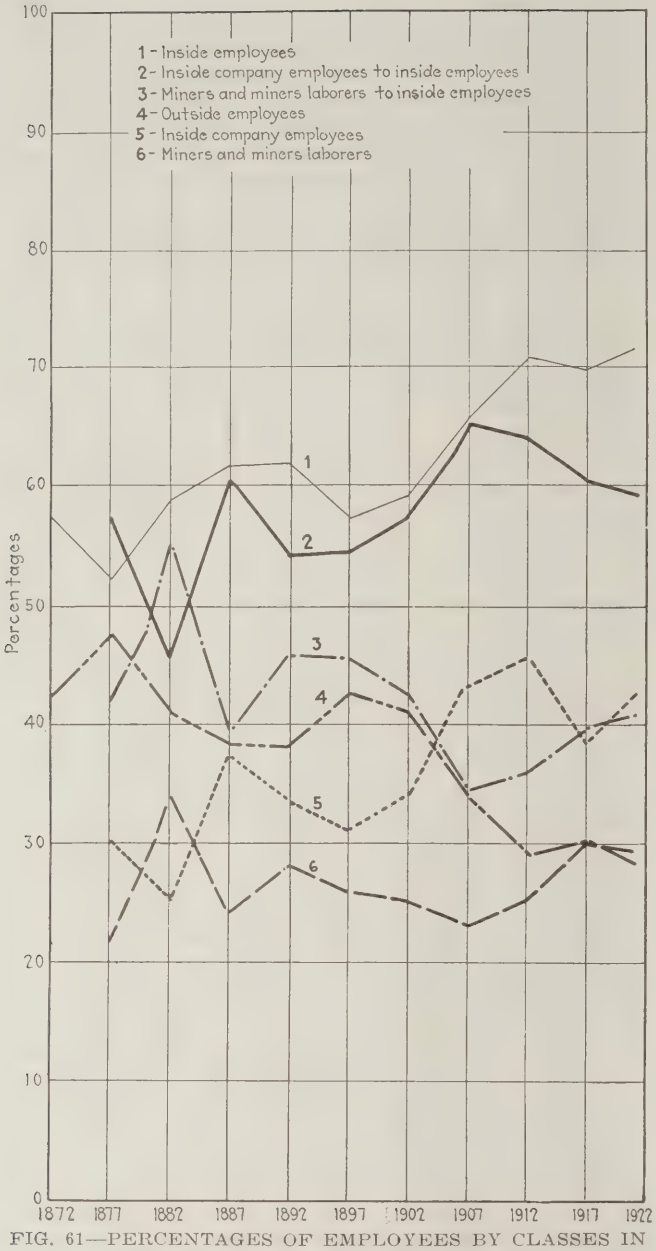

FIG. 61—PERCENTAGES OF EMPLOYEES BY CLASSES IN THE PANTHER CREEK DISTRICT

The data from which these curves was calculated will be found in Table XLVIII.

thickness of the workings, as is shown in Fig. 52. It is generally believed in this district that, owing to maintenance costs, the thicker beds are the more difficult to work. Perhaps, however, the miner and miner's laborer partly compensate for this by greater output.

The general reduction in the thickness of the beds continued after 1902. This might logically have continued to increase the output per miner and miner's laborer, but actually the output dropped. If production varies with bed thickness, then what is the most economical thickness of bed to be worked? Is it 25.5 ft., as is shown in the thickness curve, or is it some other figure, or does the thickness have no material effect on the production? No positive answer can be made, but it is probable that production variations in the Panther Creek district were not due to changes in bed thickness but to other causes which are not local but general and will be discussed later.

Other interesting data are disclosed by comparing this curve with similar curves for districts previously discussed. The district figures for daily production per miner and miner's laborer were: Lackawanna, in 1877,

TABLE XLVII—AVERAGE DAILY PRODUCTION OF INSIDE MEN
(In Gross Tons)

	Miners and Miners' Laborers		Inside Company Men		
Year	Reported	Corrected for Small Sizes	Reported	Corrected for Small Sizes	Corrected for the 8-Hr. Day
1877	6.70	9.17	4.85	7.33	5.86
1882	5.17	7.67	6.39	9.49	7.59
1887	6.27	8.35	4.11	5.48	4.38
1889	5.28	5.98	5.68	7.48	5.98
1892	7.00	8.22	5.94	7.58	6.06
1896	7.34	8.98	5.94	7.25	5.80
1898	8.24	9.81	7.03	8.37	6.59
1902	8.94	9.70	6.63	7.19	5.95
1907	8.88	9.54	4.72	5.07	4.57
1911	5.62	5.93	5.20	5.48	4.88
1913	6.78	7.06	3.78	3.94	3.51
1917	7.76	7.76	5.67	5.67	5.67
1921	6.41	6.41	4.43	4.43	4.43

6.21 tons and in 1921, 3.51 tons, a decrease of 43.7 per cent; Wilkes-Barre in 1877, 6.58 tons and in 1921 3.76 tons, a reduction of 42.9 per cent; Nanticoke in 1877, 8.83 tons and in 1921, only 4.04 tons, a decrease of 54.2 per cent; Eastern Middle coal field in 1877, 7.03 tons and in 1921, 4.39 tons, a reduction of only 37.9 per cent. However in the Panther Creek district in 1877 the production amounted to 9.17 tons and in 1921 this had decreased 27.9 per cent to 6.41 tons. This is the least reduction among all the districts.

At the same time the production per man was considerably higher than in any of the other districts. This shows that more coal can be produced per miner and miner's laborer in the steeply pitching districts than in the flatter beds, because the miner does less hand loading. Were it not for other factors entering into the cost of production, it would seem that the Panther Creek district's costs should be lower.

The other set of curves in Fig. 60 shows the daily production per inside company employee. Here, generally speaking, there is a steady decrease in the output per man. This is caused by the increasing amount of underground maintenance and the greater supervision given the work.

Fig. 61 and Tables XLVIII and XLIX show the number of each class of employees and also the percentage relationship of these employees to the total number of employees. Comparing these curves with similar ones for the other districts it will be noted that the number of inside company employees has greatly increased, a factor counterbalancing the large output per miner and miner's laborer and increasing the mining cost.

TABLE XLVIII—MEN EMPLOYED IN PRODUCTION OF ANTHRACITE IN THE PANTHER CREEK DISTRICT

Year	Total Employees	Inside	Outside	Miners and Miners' Laborers	Inside Company Men
1872	1,710	981	729	.....	.....

Why Fans Often Cease to Give Satisfaction and Frequently Take Excessive Power to Drive*

Equivalent Orifice of Fan and Mine Should Be Equal—If Fan Delivers More Air Than Pressure Will Circulate Through Mine, Air Will Back Out of Fan—Changing Fans as Mine Develops

By J. R. Robinson
Consulting Engineer, Pittsburgh, Pa.

FOR a number of years I was engaged in the designing, manufacture and installation of mine fans of the Guibal type. At that time it was customary for mining companies to order a fan of a certain wheel diameter—10 ft., 16 ft., 20 ft. or perhaps 25 ft.—accompanying the order by a specification as to the quantity of air the fan was supposed to deliver. The water gage, or pressure, rarely was considered. The diameter of wheel seemed to be the determining factor in the purchase and installation of the fan. The bigger the wheel the more air was the usual thought in the mind of the purchaser.

These fan installations sometimes proved satisfactory, but in most cases they did not. Sometimes the installation met all expectations when first made, but in a few years it became entirely unsatisfactory. The purchaser would sometimes praise the fan highly when it was first installed and a few short years later would "cuss out" the fan and the maker because the ventilation afforded by the fan was unsatisfactory. Little seemed to be known as to the reasons why a fan should be effective when first installed and then become wasteful and inefficient after a few years' use.

Everyone seemed to be puzzled by these phenomena. The best makes of fans were being alternately praised and blamed, one mining man swearing by a certain maker and another swearing at him.

At the time to which I refer, the Guibal fan was generally made of wood, except the shaft, boxes and spiders, and owing to its light construction it was incapable of creating high pressures. About the same time the Capell fan was coming rapidly into use. It was a steel fan and capable of creating a much higher pressure than the wooden Guibal fan. This Capell fan frequently failed to do what was expected of it. The installation was made with the understanding that it would deliver a certain quantity of air, but when the trial was made the fan failed to produce that quantity. Then arguments begun, neither the maker nor the purchaser having a clear idea of why the quantity of air was deficient. In my conversation with the American representative I was unable ever to learn why his fan had failed to perform as expected. If he knew, he wouldn't tell.

I have spent much time studying his work as well as my own and others, and I believe he never alighted on the real reason why his fan failed to deliver as much air to the mine as was expected. His want of knowledge probably accounted for his hostility to those who showed dissatisfaction with his work. As he was considered the best man to go to for help in mine-ventilation problems and in the application of fans to mines, when I found he was working with empirical formulas and did not really understand the fundamental principles of the work of the fan in the mine, I determined to find out for myself what these fundamental principles were.

During my investigations I found that an ordinary centrifugal fan of any or all designs and makes, when applied to a new mine, invariably passed its air through itself without backing any of the air from the intake orifice, and that often after a few years of mine development the fan began to back out some of the air; as the mine kept on developing this condition got worse and worse, and finally the fan wheel went to pieces and a new fan was required.

I also observed that when first installed a fan would pass through the mine, let us say, 50,000 cu.ft. per minute at a ½-in. water gage and that after a few years when speeded up it would pass through the mine, let us say, 70,000 cu.ft. per minute at a 2-in. water gage. now, the speed of the fan necessary to produce 2 in. of water gage is exactly twice that required to produce ½ in. Why did the fan produce only 40 per cent more air when running twice as fast as it did when originally put in the mine?

The pressure increased as might have been expected from the increased speed of the fan, but the quantity of air should have been 100,000 cu.ft. instead of only 70,000 cu.ft. Why was this? With the first condition of the mine, had the fan been speeded up to twice its original running speed, the quantity at that time would have been 100,000 cu.ft. per minute and the water gage would have been 2 in. I had abundant data to confirm this. After the lapse of a few years, however, it was a fact that the fan at twice its original speed was passing through the mine only 70,000 cu.ft.

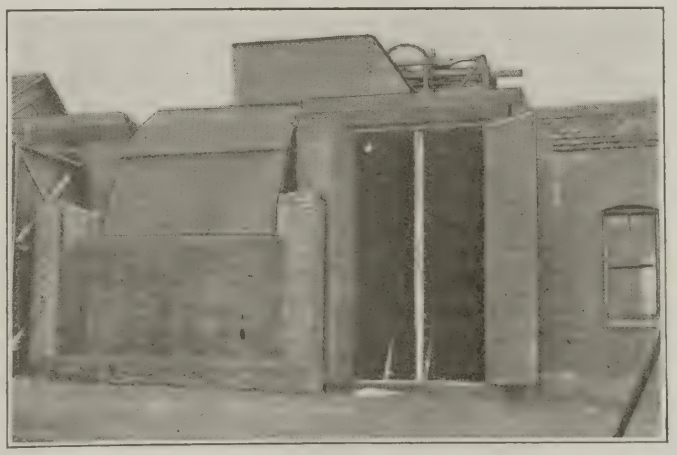

FIG. 1—FIRST FAN AT GRANT TOWN, W. VA.

This fan was 16 ft. in diameter and much too large for the mine. Its equivalent orifice was 120 sq.ft. As it required a 2.3-in. water gage to pass 132,000 cu.ft. of air per minute, the equivalent orifice of the mine was 35 sq.ft. The fan made more air than the mine would take, and the air had to work its way back through the fan, and in doing this tended to tear the fan to pieces.

*Paper read before Engineers' Society of Western Pennsylvania.

FIG. 2—SECOND FAN AT GRANT TOWN

Passing 300,000 cu.ft. of air per minute at a 9-in. water gage, this 8-ft. fan had an equivalent orifice of 40 sq.ft., which was about the same as that of the mine. Then an airshaft was sunk at the back of the workings. The company is installing another fan to take advantage of the fact that the equivalent orifice of the mine is now 58 sq.ft. instead of 40. Two-thirds of the power should be saved by using the larger fan.

But this air current required 2 in. of water gage to pass it, whereas when the fan was first installed this same 2 in. of pressure would pass 100,000 cu.ft. per minute. As a further evidence of something being wrong, much that could not be measured was backing out of the intake orifice of the fan. In my investigation I found that if I could in the second instance pass 100,000 cu.ft. per minute instead of 70,000 cu.ft. I would require for that 4 in. of water gage instead of 2 in., which showed a much worse condition of the mine than had been anticipated.

After investigating many such conditions I began to compare the orifice of passage of the mine with the orifice of passage of the fan. Most of you will recall in your study of mine ventilation that a mining engineer named Murgue had developed a formula for finding this orifice of passage and had expressed it by the equation Equivalent Orifice $= 0.0004 \times \frac{Q}{\sqrt{\text{water gage.}}}$

Q = the quantity of air passing in cubic feet per minute, the water gage being taken when the air is measured. The water gage is measured in inches and in fractions of an inch.

With this formula we can observe a mine as it develops and determine its orifice of passage, and with such information we can readily determine why our ventilation is easy or difficult and why we get the quantity we set out to get, or why we do not get any such quantity.

Now, let us take the case just cited. We set out to get 50,000 cu.ft. at a water gage of 0.5 in. and later tried to pass 100,000 cu.ft. at 2-in. water gage. Using Murgue's formula, the equivalent orifice $= 0.0004 \times \frac{50{,}000}{\sqrt{0.5}} = 28.1$ sq.ft. or again equivalent orifice $= 0.0004 \times \frac{100{,}000}{\sqrt{2}}$ or 28.1 sq.ft. So, we must have the same equivalent orifice to pass 100,000 cu.ft. per minute at a 2-in. water gage as to pass 50,000 cu.ft. per minute at a ½-in. water gage. But you will note that we found 70,000 cu.ft. per minute at a 2-in. water gage instead of 100,000 cu.ft. at that water gage, as we had anticipated. Let us apply Murgue's formula and see if we find the difficulty. The equivalent orifice $= 0.0004 \times \frac{70{,}000}{\sqrt{2}} = 19.8$ sq.ft. instead of the 28 sq.ft. which we assumed that we had for our equivalent orifice. Having found that an equivalent orifice of 28 sq.ft. is required we can readily see that we cannot put 100,000 cu.ft. per minute through an equivalent orifice of 19 sq.ft.

You will note that this equivalent orifice is the result of all the factors that impede the flow of air through the mine, whether it be rubbing surfaces, falls of roof, regulators or any other form of obstruction.

In the case above cited, when 70,000 cu.ft. is passing, the fan, if properly designed to meet the original condition, will back a portion of its air out of its intake orifice and will work at low efficiency, no matter who made it.

Now, we sometimes meet the opposite condition, which is where the equivalent orifice of the mine is increased above what was anticipated, in which case if the fan is properly designed for the work intended, it will not back a portion of the air from the intake orifice, but it will wiredraw the air through the fan—that is, the fan will be required to make more pressure to get the air through itself than is required to pass the air through the mine. So you see it is extremely important to the designing of the fan that the equivalent orifice of the mine be known, but after the fan is put into actual operation if the equivalent orifice of the mine

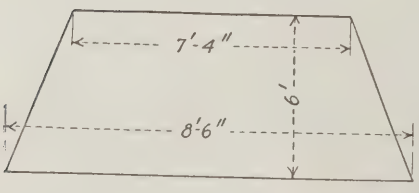

FIG. 3—SECTION OF AIRWAY AS NORMALLY DRIVEN

Area was 48.15 and equivalent orifice 20 sq.ft. as can be calculated when it is known that 116,000 cu.ft. of air per minute was passed at a 5.4 in. water gage.

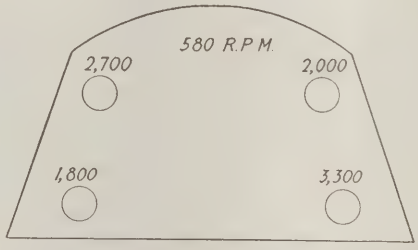

FIG. 4—VELOCITIES OF AIR WITH 580 R.P.M. OF FAN

Average velocity, 2,450 ft. per minute. Total current, 116,000 cu.ft. per minute. Water gage, 5.4 in. Power in the air, 98.4 hp.

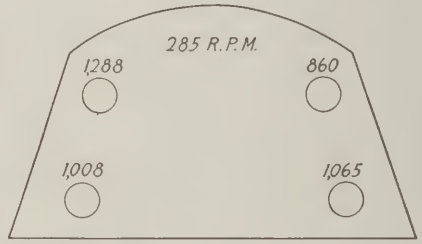

FIG. 5—VELOCITIES OF AIR WITH 285 R.P.M. OF FAN

Average velocity, 1,055 ft. per minute. Total current, 51,787 cu.ft. per minute. Water gage, 1.5 in. Power in the air, 12.54 hp.

RESULTS OF TESTS AT CHERRY TREE COAL CO.'S MINE, EMEIGH, PA.

The recording wattmeter showed in test, recorded in Fig. 4, 95 kw. or 127,345 hp. The over-all efficiency was 77.18 per cent. With 2,000 volts and 54 amperes of current and an assumed power factor of 80 per cent the horsepower used would be 160 and the over-all efficiency 61.5 per cent. In the case of the test recorded in Fig. 5, the voltage was 2,290 and the amperage 11. Again assuming an 80-per cent power factor the horsepower was 26.89 and the over-all efficiency 46.5 per cent.

FIG. 6

Turbine Fan, Cherry Tree Coal Co. Mine

The fan is only 57 in. in diameter, but as its equivalent orifice is the same as that of the mine a high efficiency is attained. The matching of mine with fan is one of the most essential requirements in mine ventilation.

be changed to any great extent, the fan will not work with a high degree of efficiency no matter how it may be designed.

We frequently hear the mine manager say he must have a certain make of fan; that he has no time for any other make. Now, that opinion is based, I have found, on the manager having had a fan of his favorite make at a mine, the equivalent orifice of which is about the same as that of the mine, whereas the other make is at a mine where the equivalent orifices of the fan and the mine do not thus match.

Ten or twelve years ago I was called upon to investigate a mine at Grant Town, W. Va. This mine is in a gaseous district and requires a large quantity of air. A 16-ft. Capell fan was in operation. It was passing 132,000 cu.ft. of air per minute at 2.3-in. water gage and was at the limit of its capacity and rapidly going to pieces. You will note that the equivalent orifice of this mine was small. The equivalent orifice $= 0.0004 \times \frac{132{,}000}{\sqrt{2.3}} = 35$ sq.ft. The equivalent orifice of the fan was about 120 sq.ft. The fan was much too large for the mine.

The management decided they wanted 300,000 cu.ft. of air, and that they would keep the water gage down to 9 in., which meant an equivalent orifice equal to $0.0004 \times \frac{300{,}000}{\sqrt{9}} = 40$ sq.ft. A fan was placed at this mine with that equivalent orifice of 40 sq.ft., and for a few years the orifice of the mine and the orifice of the fan remained about the same. During this period the fan worked with the greatest efficiency. About two years ago an airshaft was sunk at the back of the mine in order to short-circuit the air. By the use of this shaft the mine is now passing 250,000 cu.ft. of air per minute at a 3-in. water gage. Now let us examine this mine with Murgue's formula:

$$\text{Equivalent orifice} = 0.0004 \times \frac{250{,}000}{\sqrt{3}} = 58 \text{ sq.ft.}$$

The mine has now 58 sq.ft. of equivalent orifice, and the fan in use has but 40 sq.ft. To pass 250,000 cu.ft. of air through itself the fan must create a much higher pressure than is required to pass the air through the mine. Consequently it is now a wasteful machine, although it was economical and efficient before the shaft was sunk, and the equivalent orifice of the mine enlarged beyond the equivalent orifice of the fan.

A new fan is being placed at the mine to have an equivalent orifice the same as that of the mine, and as long as such conditions are obtained this fan will have the greatest efficiency. Let us see now what difference there would be in the power applied to operate each fan. It will be remembered that to pass air through two different sized openings requires power inversely as the cube of the size of the openings. The former fan had a 40-sq.ft. orifice of passage and the new fan has a 58-sq.ft. orifice of passage. The cube of 40 is 64,000. The cube of 58 is 195,112. It would require three times as much power to pass the 250,000 cu.ft. per minute through the fan with the 40-cu.ft. equivalent orifice as to pass the same quantity through the fan with that orifice increased to 58 sq.ft. when the mine resistance is equal to 3 in. of water gage.

The Cherry Tree Coal Co. has a mine at Emeigh, Pa., through which the fan at present installed is passing 116,000 cu.ft. of air per minute at a 5.4-in. water gage. The equivalent orifice of this mine is $0.0004 \times \frac{116{,}000}{\sqrt{5.4}} = 19.97$ sq.ft.—nearly 20 sq.ft. This is not a big orifice to pass over 100,000 cu.ft. of air, but you will note the test taken by the engineers of the Cherry Tree Coal Co. in Fig. 3 and that the over-all mechanical efficiency is 77 per cent.

This efficiency is high because the fan is designed for a mine such as this with a small equivalent orifice and because the equivalent orifices of the mine and the fan are practically the same. An airshaft has since been sunk near the back of the mine, and the coal company is now installing at this new airshaft a new fan which has an equivalent orifice which will suit the new equivalent orifice of the mine. The continued use of the present highly efficient fan on this mine, with its enlarged equivalent orifice, would be extremely wasteful of power.

I will now call your attention to a mine whose fluctuating equivalent orifice requires the changing of its fan from a large to a small fan and back again to the large

FIG. 7—SIX-FOOT FAN OF LOWBER GAS COAL CO.

Too big a fan caused a continuous waste of electric current. By replacing a fan with an equivalent orifice of 45 sq.ft. with one of about 32 sq.ft. enough power was saved to pay for the fan in eight months. It should be added that the first fan matched the mine satisfactorily when it was first installed.

fan. The Lowber Gas Coal Co. has a mine near Fayette City, Pa., which has these conditions. The mine was developed in such a manner as to pass 100,000 cu.ft. per minute at 2-in. water gage. The equivalent orifice is therefore $0.0004 \times \frac{150{,}000}{\sqrt{2}} = 42$ sq.ft.

An 8-ft. modern steel fan was placed at this mine. Its equivalent orifice was about 45 sq.ft. It was close to the requirements of the mine when first installed, but as the mine developed the quantity of air given off by this fan was gradually decreased until when I first observed it it was passing through the mine 87,000 cu.ft. per minute at 1.2-in. water gage. Now let us observe this new condition with the use of Murgue's formula. The equivalent orifice $= 0.0004 \times \frac{87{,}000}{\sqrt{1.2}} = 31.63$ sq.ft. instead of the original 42 sq.ft. the equivalent orifice has dropped 10 sq.ft. to less than 32 sq.ft.

Now the power required to pass the air with the 8-ft. fan originally at the mine was 78 hp. measured on the brushes of the direct-current motor by which the fan is driven. A load such as this should demand about 30 hp. with a suitable fan. Such a fan was installed with an equivalent orifice of about 30 sq.ft. and the saving in power was nearly 50 hp. The cost of making the new installation—fan, motor and belt—was approximately $4,000 and this sum is the reduction in the power bill saved in about eight months.

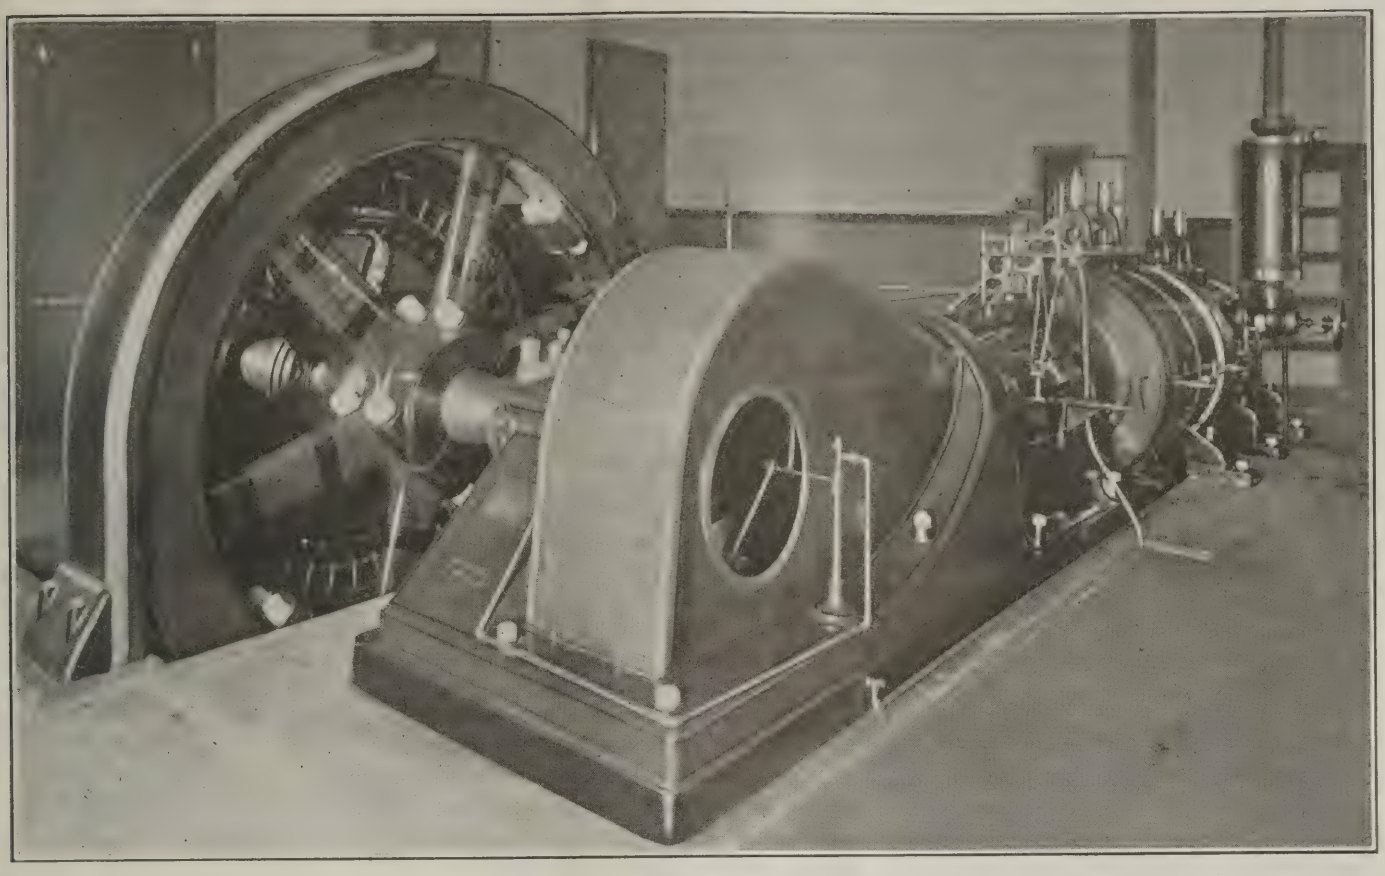
The 8-ft. fan originally installed, though left idle, was not dismantled but left still connected to the mine, so that it could be used should a new airshaft be sunk at the back of the mine. This it is expected would enlarge the equivalent orifice of the mine to about 45 sq.ft. The new shaft probably will be connected to the mine within four years from the time when the temporary fan was installed. You will note that in this brief period the temporary installation will have paid for itself at least six times out of the power saved.

The equivalent orifice of the mine, therefore, is the basis on which the calculations for a mine fan should be made. Having the equivalent orifice and the quantity and pressure known, we can determine accurately the characteristics of the fan. Knowing the pressure or water gage, we know the speed at which the air must travel and accordingly the equivalent air pressure. With the speed of the air known, we know what must be the velocity of the rim of the fan wheel in order to create the given air pressure, and knowing the speed of the fan and its volumetric capacity, we can determine the width the wheel should be to give off the quantity of air required at the given pressure.

This may seem like a complicated cycle of calculations, but it is all logical and each step follows in succession from the base of all the calculations, which is the orifice of passage of the mine.

Vegetable Origin of Anthracite Beds At Last Definitely Proved

AT THE meeting of the Society of Economic Geologists held in New York May 18 and 19, a paper was presented by H. G. Turner, of Lehigh University, on the "Microstructure of Anthracite Coal," which was illustrated by lantern slides made from microphotographs of great beauty, showing plainly and clearly many different types of vegetable structure.



This adds final and conclusive proof to the heretofore generally accepted belief that anthracite is, like bituminous coal, of vegetable origin. Prior to this work no microscopic slides had ever been produced actually showing the presence of such material, it having been found impossible to produce sections thin enough to be transparent, and efforts to learn the structure by examination of polished surfaces had entirely failed.

Most of the work described has been done within the last year. Many have tried unsuccessfully to prove or disprove the presence of such structures in anthracite and it is rather remarkable that at last this has been accomplished. The slides are far better than those which have been produced showing the presence of similar vegetable structure in bituminous coal.

The method used by Messrs. Turner and Randall in producing these slides is remarkably simple and easy of application, only about twenty minutes' work being required to prepare a specimen for the microscope or for making photomicroscopic slides.

The method as described by Mr. Turner is as follows: From a good specimen of anthracite a cube with about 1 in. sides is sawed. One side of this cube is ground and polished on a rubbing bed or table, using progressively finer and softer polishing powders, as is the practice in preparing highly polished specimens. This produces a fine mirrorlike surface. The specimen is then put in a furnace and heated to a temperature of about 250 to 300 deg. C. It then is taken from the furnace with a tongs, and the polished face of the cube is held in the flame of a bunsen burner until the surface (but not the body of the cube) is heated to a red heat. The flame is then removed, and the specimen when cooled is ready for microscopic examination by reflected light. The heating to a red heat causes a differential etching of the surface by oxidation, so that the structure is thrown into bold relief.

Messrs. Turner and Randall have in this way worked up a large number of specimens of coal from different coal seams in the southern and middle western Pennsylvania anthracite districts, this work indicating that certain types of vegetable structure apparently predominate in some of the coal beds, thus indicating the possible use of this method for correlating coal seams in different districts.

The Isolated Power Plant in the Coal Industry

Continuity of Service Essential to Economy and Safety—Isolated Power Plant Can Utilize Small Sizes of Fuel at Mines—Transmission of Electrical Energy Cheaper Than Freight Rates on Fuel

By S. J. H. White
Erie City Iron Works

MODERN methods and requirements in coal mining frequently demand the installation of isolated power-generating units. Power supplied from outside sources should never be depended upon as the sole source of supply where continuity of service is imperative. Outside sources of supply are subject to probable interruptions due to line troubles resulting from wind, sleet, thunder storms, fires, breakage of lines, failure of insulators, etc., as well as possible accidents to central-station apparatus, transformers, switching and control equipment.

The safety and often the life of the coal miner is dependent to a large degree upon continuous operation of the power plant; therefore the danger of interruption of power should be reduced to an absolute minimum. The cost of mining coal has increased to such an extent that even coal mines have found it advisable to install power-generating equipment with a view to obtaining an outlet for their small sizes of fuel and effecting increased economies in operation.

The greatest care should be exercised in selecting power-generating units, auxiliaries and all minor equipment entering into any part of the power plant. The peculiar conditions and requirements of this class of service call for dependability of every detail and especially is this true of the prime movers.

As the prime mover in the power plant is one of the most important pieces of equipment it should be of a design and type to eliminate as far as possible any probability of failure. It should be of ample capacity to carry the high-peak and emergency demands which frequently occur. It should have unusually close speed regulation, and the speed should not be materially affected by wide variations in steam pressure or load; finally, it should be direct-connected to the generator, thus eliminating belts, ropes, gears, etc.

Control Equipment Should Be of Simple Design

In the event that ample water supply is available the prime mover may be operated condensing, but in such cases provision should be made to enable the engine to continue operating without the slightest danger of an accident in the event that the vacuum fail from any cause. Auxiliaries should be steam-driven to insure greatest dependability. Switchboards and all control equipment should be designed as simply as possible consistent with necessary flexibility, safety and up-to-date practice.

In the event that central-station power service is within available distance it is advisable that the in-

Note—Headpiece shows a typical isolated power plant at a coal mine.

dependent plant be tied in with it or that emergency-service connection be provided. Either plan insures a duplicate source of supply readily available for extra heavy peak loads or emergency requirements.

Where direct current is required in the mine, as is usually the case where haulage locomotives are used, and alternating current is supplied by the central station, a motor generator or synchronous converter will be required to connect the two systems.

To meet such conditions of load and dependability requires an engine that is extremely simple and designed for reliability, economy and durability. Its speed regulation should be easily adjustable to operate successfully under any steam or exhaust conditions and run either non-condensing or condensing without troublesome adjustment. Ample allowances should be made for handling severe overloads.

The valves should be of a type that will remain steam-tight indefinitely. The oiling system preferably should be automatic, thus insuring perfect lubrication and eliminating all probability of interrupted service due to hot boxes. Steam economy also is an important prerequisite together with ability to operate continuously at high efficiencies for long periods.

Pulverized Coal Fed to Furnace Automatically

There is always a large amount of slack and unsalable coal produced in the screening process at the mines which in the past has been thrown away as waste. Such discarded products usually contain the original number of B.t.u. per pound, but until recently this fuel could not be successfully utilized in producing steam. To meet these conditions the Erie City Iron Works has placed on the market a successful combination bituminous-coal pulverizer and feeder, which thoroughly pulverizes the coal and at the same time automatically feeds it to the boiler furnace with just the correct volume of air to obtain highest efficiency. These machines permit the utilization of the waste fuel mentioned above, and the method of automatic firing employed effects extremely high furnace efficiencies, usually much higher than is obtained with high-grade coals and the best mechanical stokers.

The coal-pulverizing apparatus referred to has been perfected and thoroughly tested out in several power plants during the past three or four years. This method of firing what were formerly considered waste coal products has reduced fuel cost in power plants many per cent, not only because of reduced cost of the lower grades of fuel consumed but also because of the much higher furnace efficiencies obtained. Full automatic control of coal and air supply, as well as damper control, in conjunction with the coal-pulverizing apparatus makes the boiler plant equipped with such devices the most efficient ever developed.

It is entirely practicable for the coal mines to install large power plants equipped to burn the waste coal as outlined and sell the surplus energy generated to the numerous large central stations and systems, who will gladly purchase same at rates attractive enough to prove profitable to the mine owners, and at the same time result in benefit to the systems.

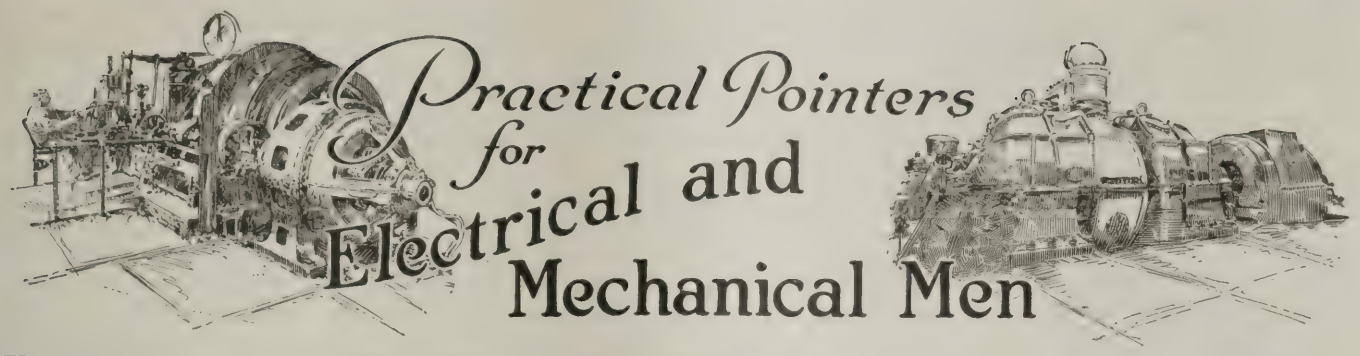
The high freight rates on coal are causing central stations to boost their rates; therefore if the plan suggested is carried out it will prove of great benefit to the coal-mine owners, the central stations and the general public.

A much safer and more profitable plan is for the various coal mines to install power-generating plants as suggested, operate them on waste coal products, and operate their plants in parallel with each other and the large central-station transmission lines, thereby forming an immense "super-power plant" consisting of many small units. The failure of several of these units, even at the same hour, would inconvenience no one seriously, not even the workers at the mines where the local power plant may be in trouble.

Obtaining such power from the coal mines would be less costly to central stations than to produce it with a super-power plant, provided the latter has duplicate equipment, as it should have. The fixed charges on proposed super-power plants would be enormous, and as an inevitable consequence the cost of operation would be high.

Mine Plants Could Get Power Without Cost

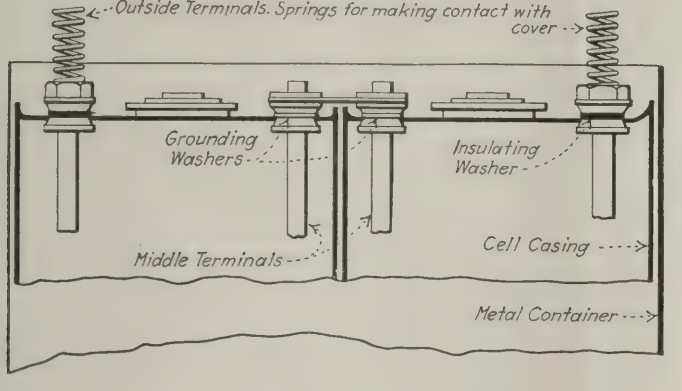
The plan herein suggested constitutes a dual generating plant with smallest investment, and the investment, being divided among many, is a minimum burden as such. Our coal mines are fortunately situated near industrial centers, and the cost of transmission lines would be comparatively small, as they would be used merely to connect the proposed power plants at the mines with the existing high-tension lines of the central stations.



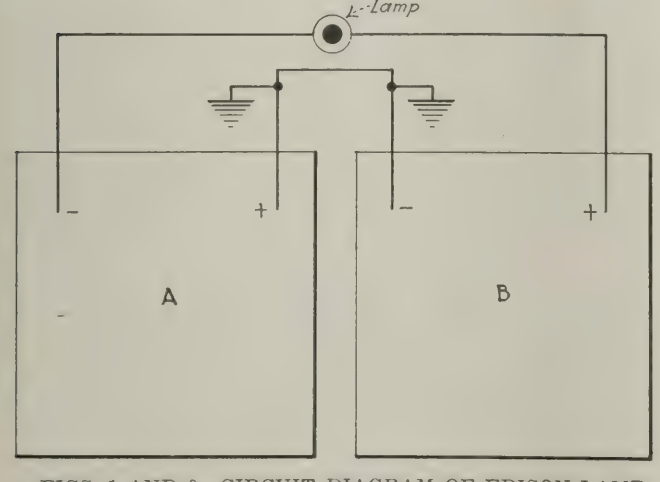
Most of the present mine power plants are more or less inefficient, but if surplus power were sold twelve months in the year to the central-station interests at slightly above cost, it would result in the coal mines getting their power for nothing, and justify much better plants being installed.

Coal-mine owners should endeavor to assist in solving our power problems by taking a deeper interest in the power-plant industry, because they actually hold the key to the situation in that they own and control the greatest source of power supply. Coal is the inactive latent state of energy which is merely put through the power house to be converted into electrical energy. Then, again, it is far cheaper freight to ship electrical energy than latent coal-energy which at its point of destination is converted into some form of useful energy like electricity.

Would Educate Workers in Economics and Government and Human Relations



THE committee on industrial relations of the National Association of Manufacturers, which is headed by M. M. Davidson, recommends that the association take steps to develop a plan of constructive education for managers and workers in industry in the fundamental principles of economics, of government and of human relations. It is the opinion of the committee that much of the discontent and distrust among the workers has come through a misunderstanding of or lack of knowledge of the economic principles involved and through failure to fully recognize and emphasize the economic principles involved, rather than through any fundamental flaw in the system itself.



The report also emphasizes the need of some agency to place before the workers information that will enable them to think straight and act accordingly. The association and the manufacturers are warned that if they ignore the slow-working poison of vicious propaganda among the workers they may soon find it too late for either preventive medicine or surgery.

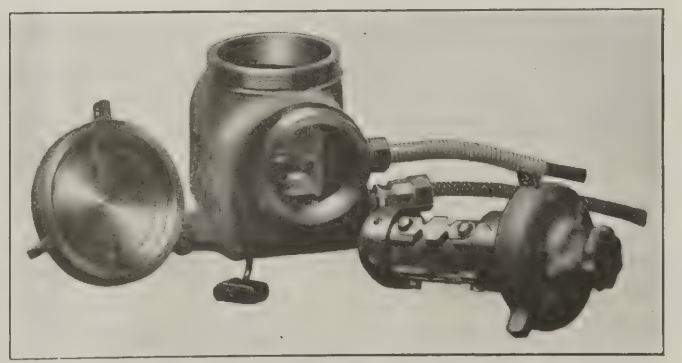
Repair to an Edison Mine Lamp Battery Which Can Be Made at the Mines

THERE is an interesting "kink" in regard to the Edison storage-battery miners' lamp which is not, I believe, generally known by a good many men who are in charge of the maintenance and care of these lamps. As everyone who has anything to do with these lamps knows, the battery for each lamp is made of two cells set edge to edge inside of a metal container. Each cell has two terminals and in the assembled battery the two outside terminals have a spring attached to them for the purpose of making the contact with the battery cover to which is attached the cord extending to the lamp and also to hold the cells firmly in the container. These same two terminals also are insulated from the metal casing of the cells as shown in Fig. 1. The two middle terminals are grounded to the metal casing of the cells and are connected to each other so that the two cells are in series. This really means that the positive terminal of one cell and the negative terminal of the other cell are grounded to their metal cell casings. (See Fig. 2.)

FIGS. 1 AND 2—CIRCUIT DIAGRAM OF EDISON LAMP

Changing the relative positions of cells *A* and *B* makes the outer terminals the inner terminals, which are normally grounded and tied together by a connecting strip. An internal ground on a middle terminal is therefore of no consequence to the operation of the battery.

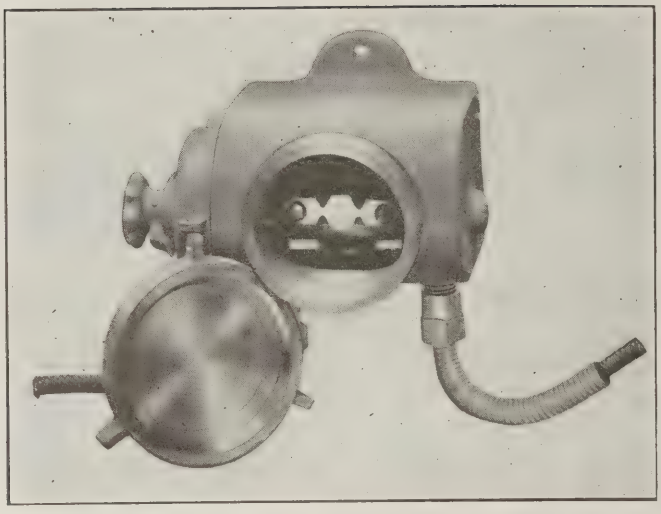
If for some reason the outside terminal of either one of the cells becomes grounded inside the cell that cell becomes short-circuited and of course will not operate and the battery as a whole will not function. This can be remedied by taking the cells out of the container and reversing their position—that is (referring to Fig. 2), cell *A* can be placed in position *B* and cell *B* in position *A*—and by removing the grounding washers from what are now the two outside terminals and placing them on the two inside terminals and also by removing the two insulating washers from what are now the two inside terminals and placing on the outside terminals. When this is done the internal ground will be on one of the two middle terminals which are normally grounded anyhow and thus will not affect the proper operation of the cell.



By this change it is readily possible to place back in service any cell that has become grounded internally on one of its terminals. In many cases this will eliminate the expense and delay occasioned by sending the battery back to the factory to be repaired.

The cells of these batteries should not be opened at the mines because this destroys the container and thus makes it impossible to reseal it properly.

Wilkes-Barre, Pa. O. E. KENWORTHY.

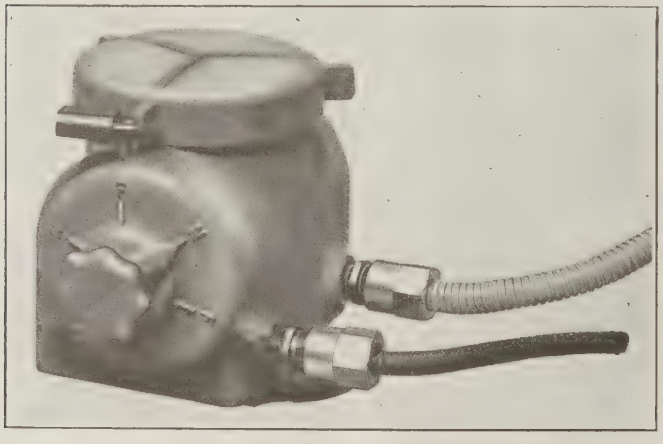


Flameproof Fuse Box

AN IDEA of what may be expected to be found on the permissible flashproof storage-battery locomotive can be gained from some of the latest developments in accessories and parts which have recently been brought out.

EXPLODED VIEW OF FUSE BOX

Fuse links are mounted on the cylindrical drum, which is inserted into the end of the fuse compartment. Three such fuse links amply protect the equipment and eliminate the necessity of refusing on the road, which would defeat the purpose of the scheme.



FUSES AND DRUM IN POSITION

With the fuse cylinder in position the inspection cap may be removed and all fuse links turned into sight. This of course can not be done except by the properly authorized person who does so in a non-gaseous location in the mine.

The schedule governing the design of the locomotive and its parts prohibits the opening of permissible compartments during operation; the blowing of a fuse therefore would necessitate the towing of the locomotive to the barn unless other arrangements were made.

To meet this objection the Mancha Storage-Battery Locomotive Co. has designed a permissible compartment in which three standard renewable fuse links are mounted on a drum. This drum can be operated by means of a handwheel indexed on the outside so as to show whether fused or neutral.

A compartment of this type is located at each end of the locomotive and connected into each battery lead so as to furnish complete protection against grounds

ASSEMBLED FLAMEPROOF FUSE BOX

The wires leading to the box are amply protected by a metallic covering. At the entrance to the box stuffing glands are provided. Change from one fuse to the other can be readily made by rotating the drum. A padlock securely locks all parts.

or short-circuits. Except under abnormal conditions it should never be necessary to go to the motor barn during a shift. The leads enter through stuffing boxes, and a lock also is provided to make the apparatus secure against tampering.

NEW COAL SAMPLING RECORD.—In a recent month the Pittsburgh experiment station of the U. S. Bureau of Mines established a new record for the analyzing of coal samples, 1,030 samples having been examined and reported upon. These samples were collected from the different fields of the country, including Alaska.

Care of Bearings on Generating Machines

FOR generating equipment fitted with self-oiling bearings, the following rules should be followed to insure continuity of service:

The well should be filled to such a height that the rings will carry sufficient oil upon the shaft. If the bearings are too full, oil will be thrown out along the shaft. The oil should be renewed about once in six months, or oftener if it becomes dirty and causes the bearings to heat.

The bearings must be kept clean and free from grit. They should be frequently examined to see that the oil supply is properly maintained and that the oil rings do not stick. Use only the best quality of oil. New oil should be run through a strainer if it appears to contain any foreign substance. If the oil is used a second time, it should first be filtered and, if warm, allowed to cool.

A warm bearing or a "hot box" probably is due to one of the following causes:

(1) Excessive belt tension.
(2) Failure of the oil rings to revolve with the shaft.
(3) Rough bearing surface.
(4) Improper fitting of the journal boxes.
(5) Bent shaft.
(6) Use of poor grade or dirty oil.
(7) Bolts in the bearing cap may be too tight.
(8) End thrust, due to improper leveling. A bearing may become warm because of excessive pressure exerted by the shoulder of the shaft against the side of the bearing.
(9) End thrust, due to magnetic pull, rotating part being "sucked" into the field because it extends beyond the field poles further at one end than at the other.
(10) Excessive side pull, because the rotating part is out of center.

If a bearing becomes hot, first feed heavy lubricant copiously, loosening the nuts on the bearing cap; and then, if a machine is belt-connected, slacken the belt. If relief is not afforded, shut down, keeping the machine running slowly until the shaft is cool, in order that the bearing may not "freeze." Renew the oil supply before starting again. A new machine should always be run at a slow speed for an hour or so in order to see that it operates properly. The bearings should be carefully watched to see that the oil rings are revolving and carry a plentiful supply of oil to the shaft.

Relation Between Phase and Capacity

WILL you be kind enough to explain through your columns the relation between phase and capacity of alternating-current equipment? By this I mean an explanation of the volt-ampere capacity of single-, two- and three-phase connections. ELECTRICIAN.

For a single-phase generator or transformer the output at any time, expressed in kva., is the product of the current in amperes and the pressure in volts divided by one thousand.

For a two-phase generator or transformer the output at any time, expressed in kva., is the sum of the two single-phase outputs as above. If the load is balanced the two-phase output is twice the output of either phase. For a three-phase generator or transformer with balanced load, the kva. output is the product of the line current, line voltage and 1.73 divided by one thosuand.]

Iron Sulphide in Coke Can Be Reduced by Air and Heat Also Free Sulphur, but Not in Sufficient Quantity*

Experiments Show That Ferrous Sulphide in Some Cokes Can Be Decreased 81 per Cent and Free Sulphur 22 per Cent—Solid-Solution Sulphur Unchanged—Sulphate Sulphur Increased—Roasting and Vacuum Fails

By Alfred R. Powell
Associate Chemist, U. S. Bureau of Mines, Pittsburgh, Pa.

In A paper† entitled "The Forms of Sulphur in Coal," contributed to the *Journal of the American Chemical Society*, I have described an investigation in which the forms of sulphur in coke were determined and described. Coke was found to contain four characteristic forms of sulphur—namely, ferrous sulphide, sulphates, adsorbed free sulphur and sulphur held in solid solution in the carbon.

While the coke is still in the oven only two forms of sulphur are present—namely, the first and the last of those mentioned. During the quenching, however, the sulphur of the coke is subjected to much oxidation, a portion of the ferrous sulphide being oxidized to free sulphur and sulphates, the sulphur in solid solution remaining unchanged. The coke, however, loses no sulphur during this process, as the free sulphur which is formed is retained by the coke in an adsorbed form.

Oxidize Sulphide and so Get Rid of Sulphur

As this ferrous sulphide is so easily oxidized, an investigation was undertaken to determine whether industrial advantage could be taken of this property for the desulphurization of coke. Although it is true that such a roasting process would not reduce the sulphur which is in solid solution, still the removal of the sulphur that is in the form of ferrous sulphide would undoubtedly improve the coke from the standpoint of the metallurgist. The betterment in the coke would arise not only from the decrease in total sulphur, but also from the large decrease in the ferrous sulphide, which is responsible for the contamination of the iron in the upper part of the blast furnace.

The desulphurization of coke by roasting in air is not a new idea, but dates back to the earliest days of coke manufacture. In 1871, Philippart‡ published the results of some work done by him on the desulphurization of coke by air, as well as a review of the results of earlier investigators. In these earlier experiments, nothing was known of the forms in which the sulphur existed in the coke, and the temperature measurements were only approximate, in consequence the results were neither conclusive nor complete. The desulphurization figures given by these early investigators generally showed a low efficiency for the process, but some extraordinary results were claimed by certain inventors. In the light of our new knowledge concerning the sulphur in coke, it seemed to be important enough to warrant investigation.

One of the first factors to be determined in this investigation was the best temperature for the oxidation of the ferrous sulphide in the coke. It might be assumed that the higher the temperature the faster would be the oxidation of the ferrous sulphide but it must be remembered that the coke itself would oxidize more rapidly at high temperature. It was, therefore, necessary to determine a mean temperature, that would best satisfy both conditions.

When Over Hot Coke Takes Sulphide's Oxygen

A series of tests at different temperatures was made, the powdered metallurgical coke being placed in a tube heated to the desired temperature, a slow current of air being passed over it. An analysis of the residue for ferrous sulphide determined the thoroughness of the oxidation, and the loss in weight of the sample showed the relative coke loss at different temperatures.

At 300 deg. C., the oxidation of ferrous sulphide proceeded rather slowly, and there was no loss of coke. At 400 deg. C., the oxidation took place much more quickly, and still there was no appreciable loss of coke. At 500 deg. C., the oxidation of the ferrous sulphide was complete at the end of a few minutes, and the coke loss was small, being under 1 per cent. At 600 deg. and higher a noticeable coke loss took place and the oxidation of the ferrous sulphide was slower, if anything, than at 500 deg. as the oxygen that should have combined with the sulphide was consumed in the combustion of the coke.

These experiments showed that 500 deg. was the best temperature for the oxidation of the ferrous sulphide, when the relative speeds of oxidation of the ferrous sulphide and the coke itself were considered. For this reason the temperature used in the treatment of the chunk coke was 500 deg., although several runs were made at temperatures as high as 650 deg., for reasons that will be described later.

Differentiating the Four Sulphurs in Coke

The method of analysis used to ascertain the percentage of the various forms of sulphur in the coke both before and after the desulphurization treatment I have described in another paper.* In brief this examination consisted in treating one sample of the coke with hydrochloric acid, the hydrogen sulphide evolved being a measure of the ferrous sulphide in the coke. The sulphate in the coke would be in this hydrochloric-acid solution, and could be determined as such. Then, another sample of the coke was reduced by heating it to a red heat in an atmosphere of hydrogen, and cooling it in the same atmosphere. This reduced the sulphates to sulphides, and also the adsorbed sulphur to ferrous sulphide.

*Article entitled "The Desulphurization of Coke by Air," in Reports of Investigations, U. S. Bureau of Mines.

†Vol. 45, 1923, pp. 1-15.

‡Philippart, M. A., *Revue Universelle des Mines*, vol. 28, 1871, pp. 261-318.

*Powell, Alfred R., "The Quantitative Determination of the Sulphur Forms in Coke." To be read before the Gas and Fuel Section of American Chemical Society, New Haven, 1923.

On treating this with hydrochloric acid, the hydrogen sulphide evolved would be a measure of the combined ferrous sulphide, sulphates and the adsorbed free sulphur. By subtracting the ferrous sulphide and the sulphates, which were already known, the content of free adsorbed sulphur could be calculated. Then the combined ferrous sulphide, sulphates, and free sulphur subtracted from the total sulphur gave the sulphur held in solid solution by the carbon. In this manner all four of the sulphur forms could be determined. The method is quite reliable, as has been proved by checking its results against others which have been developed in the course of investigations into the sulphur in coke. The comparisons have been very satisfactory.

Freed Chemically, Remains Physically Bound

Any process designed to secure the desulphurization of coke by air must involve at least two stages. The first stage consists of the oxidation of the ferrous sulphide of the coke to form iron oxide and free sulphur. The best temperature for this reaction has already been mentioned. The pressure of the air is important, because increased pressure tends to force the air into the pores of the coke, and therefore, promote the oxidation.

The second stage of the process consists in the removal of the free sulphur which is formed in the oxidation, and has been adsorbed on the surfaces of the coke. Three different methods for the removal of this sulphur were tried in this investigation. The first consisted in the production of a vacuum, whereby it was hoped that the sulphur would volatilize at the temperature of the coke at that point in the process—that is, 500 deg. The second method tried for the removal of the sulphur was the use of a higher temperature than 500 deg.

However, whatever temperature was used in this second stage of the process had to be used in the first stage also, as it would be impracticable to permit the coke to cool down from the oven temperature to 500 deg., and then to heat it again for the second stage of the process. For this reason, 650 deg. was about the highest point that the temperature could be raised. The third method for the removal of the free sulphur from the coke consisted simply in the continued passage of the air through the coke after the primary oxidation of the ferrous sulphide, so as to roast out the retained sulphur. This latter reaction always took place to some extent as the oxidation of the free adsorbed sulphur started before the primary oxidation of the ferrous sulphide was complete.

Hydrogen Will Not Serve with Iron Present

As the previous investigation of the coke sulphur had indicated that adsorbed sulphur readily could be removed from the coke by the action of hydrogen at a red heat, it might be assumed that such treatment might be efficiently applied after the oxidation of the ferrous sulphide, in order to remove the adsorbed free sulphur. However, in the instance mentioned, the iron had been removed from the coke by acid extraction before the hydrogen treatment. Where the iron remained in the coke, as it would in practice, the effect of hydrogen is simply to reverse the effects of the roasting and reconvert the free sulphur into ferrous sulphide. Such treatment is therefore out of the question.

As metallurgical coke must be kept in the chunk form, in which it is made, all of the desulphurization tests were performed on coke which ranged from 2 to 3 in. in diameter. By doing this, results could be obtained which would be comparable to large-scale practice, whereas, tests on powdered coke would have little real meaning.

The apparatus for performing the tests consisted of a 3-in. steel tube about 2 ft. long, which was wound with resistance heating wire. A thermocouple was inserted between the tube and the winding so that the temperature of the tube could be controlled. A frame held the tube in a vertical position. The lower end was closed by a cap through which a small pipe was inserted for the air inlet.

The upper end was closed by a blind flange, which could be easily removed for the insertion and the extraction of the coke. An outlet through this end of the tube conducted the air through a solution of sodium hydroxide and thence to a vacuum-pump. Valves were provided so that the coke could be kept under air pressure, under vacuum, or simply in a steady stream of air at any rate of flow desired. The purpose of the sodium hydroxide solution was the absorption of the sulphur dioxide produced by the roasting.

Use of Chunks of Coke Mars Experiments

One rather serious source of error was present in these experiments, and to eliminate it entirely seemed impossible. This was the fact that one chunk of coke had to be taken as representative of the original coke, while several other chunks from the same batch were taken for the test. In other words, it was impossible to crush the coke to get a homogeneous sample, as the tests had to be run on the coke of chunk size. However, from the analysis of different chunks from the same batch it was shown that the principal nonhomogeneity existed in the solid-solution form of sulphur. As this form remains unchanged in the coke under treatment short of its actual destruction, the quantity after test was considered to be the same as that in the original sample, and the total sulphur was corrected accordingly. In this manner results were obtained which were comparable.

Two different cokes were tested in this investigation. No. 1 was a high-sulphur coke manufactured in a vertical retort. In this coke the solid-solution form of sulphur predominated, so that little desulphurization was possible. No. 2 was a coke made from Illinois coal and was of such a type that proper desulphurization could have made it available for blast-furnace coke. The results of the different tests are given in Table I.

TABLE I—DESULPHURIZATION BY AIR OF COKE NO. 1

	Original	Run 1	Run 2	Run 5
Temperature, deg. C.	....	500	650	500
Roasting time, min.	....	30	30	210
Vacuum time, min.	....	10	10	none
Sulphur evolved as SO_2, per cent of coke	....	0.19	0.23	0.46
Coke loss, per cent	....	none	1	1
Sulphur as solid solution, per cent	1.90	1.90	1.90	1.90
Sulphur as ferrous sulphide, per cent	0.58	0.24	0.24	0.11
Sulphur as free sulphur, per cent	0.62	0.50	0.38	0.39
Sulphur as sulphate, per cent	0.10	0.13	0.10	0.31
Total sulphur, per cent	3.20	2.77	2.62	2.71

DESULPHURIZATION BY AIR OF COKE NO. 2

	Original	Run 9	Run 10	Run 11
Temperature, deg. C.	....	500	500	500
Roasting time, minutes	....	30	....	....
Vacuum time, minutes	....	10	(a)	(b)
Sulphur evolved as SO_2, per cent of coke	....	0.08	0.08	0.14
Coke loss, per cent	....	none	none	none
Sulphur as solid solution, per cent	0.84	0.84	0.84	0.84
Sulphur as ferrous sulphide, per cent	0.26	0.16	0.12	0.10
Sulphur as free sulphur, per cent	0.19	0.23	0.18	0.15
Sulphur as sulphate, per cent	0.02	0.04	0.06	0.06
Total sulphur, per cent	1.31	1.27	1.20	1.15

(a) Alternate roasting and vacuum every few minutes for 20 times.
(b) Alternate roasting at 4-lb. air pressure and vacuum every few minutes for 20 times.

In the runs where the vacuum treatment was used, it was not possible to reduce the pressure to below 4 cm.

of mercury. This was due to the fact that the apparatus was of metal and was comparatively large. In consequence leaks could not be avoided. Also the vapor pressure of the sodium-hydroxide solution which was in the system, was a limiting factor on the completeness of the vacuum obtainable.

Run No. 1 shows the effect of roasting and vacuum on the sulphur of the coke. Over half of the ferrous sulphide was oxidized, there was a slight decrease in the free sulphur, and a very small decrease in sulphate. The most disappointing feature of this run was the persistance of the free sulphur in the coke. The vacuum, apparently, was inefficient as far as the removal of the free sulphur was concerned.

Long Roasting Betters Coke But Little

Run No. 2 shows the effect of higher temperature on the results. Under these conditions more of the free sulphur is eliminated, but the final result is far from satisfactory. In No. 5 run the effect of long-continued roasting is shown. The result is much better oxidation of the ferrous sulphide, but this improvement is counterbalanced by the excessive formation of sulphates. The long roasting does not have much effect on the elimination of free sulphur, the obstinate retention of this free sulphur being the chief difficulty in any possible use of this process for the desulphurization of coke.

The desulphurizing effect of air on No. 2 is shown to be small by the results from run No. 9. By alternating the roasting and vacuum as in run No. 10, somewhat more sulphur is eliminated than in the previous run; but much free sulphur is still retained. By putting the air for the roast under 4-lb. pressure, and alternating this with the vacuum—as in run No. 11—still better results were obtained; but again the results gave no promise of industrial utilization.

Wherein the Much-Commended Process Fails

Summary and Conclusions—It is possible to draw the following conclusions from this investigation of the desulphurizing effect of air on coke:

(1) At temperatures near 500 deg. C., it is possible to oxidize the larger part of the ferrous sulphide in coke to iron oxide and free sulphur, without causing any appreciable oxidation of the coke itself.

(2) The free sulphur produced as just described is retained in the coke in an adsorbed form. It has been found impossible to remove this from the coke completely, and even part removal has been difficult. Several methods have been tried and the results may be briefly summarized as follows:

(a) *Vacuum.*—The application of a vacuum to the coke at the temperature at which the coke is roasted is inefficient. Little or no free sulphur is drawn out of the coke by this method.

(b) *Higher Temperature.*—From an industrial standpoint, the temperature used in the secondary stage of the process to remove the free sulphur should be the same as that used in the primary stage of roasting the coke, as it is impracticable to heat the coke after once it has been cooled. On the other hand, the coke cannot be heated much above 500 deg. C., so that there is an upper limit to the temperature—say 650 deg. Raising the temperature of the process to this latter figure has little added effect in the elimination of the free sulphur.

(c) *Secondary Roasting.*—By this method the passage of air through the coke is continuous beyond the point where the available ferrous sulphide has been oxidized to free sulphur. The results showed some added elimination of the free sulphur, and by the long-continued roasting, more of the ferrous sulphide was oxidized. An unfavorable feature of this long roasting was the excessive formation of sulphates.

(d) *Alternate Repeated Roasting and Vacuum Treatment.*—This method for reducing the free sulphur was tried both with the air at ordinary pressure and with a pressure 4 lb. higher than atmospheric. The result was a somewhat increased elimination of the free sulphur, but even then the major part of it remained in the coke.

(3) This investigation has indicated that the industrial desulphurization of coke by air is not practical as far as the methods which have been tested would apply. The chief difficulty in the application of the process lies in the tenacity with which the free sulphur is retained by the coke. If a method could be found for the complete removal of this free sulphur, metallurgical coke could undoubtedly be improved by the air treatment, for the solid-solution sulphur and the remaining ferrous sulphide enclosed in the coke-walls do not have as great a contaminating effect on the iron in the upper planes of the blast-furnace as has that part of ferrous sulphide which is capable of oxidation by this process.

Training Miners Adds to Their Efficiency

ALTHOUGH the literature of mine engineering is extensive, there is nothing in print in this country, and very little in England, which could enlighten the miner as to the methods by which he could attain maximum earnings by increasing the efficiency of his work at the face. Inquiry into the inequality of miners' earnings resulted in the Hudson Coal Co. assigning instructors in the actual work of mining to the ten or twelve employees in each operation whose earnings were least. This effort has been continued long enough to show that by instruction thus given, the average earnings of a group of miners thus selected can be increased $1 to $1.25 per day. This instruction covers the proper placement of the hole, the angle, depth and size it is to be drilled, the character and quantity of explosives to be used, the method of tamping, etc.

Honnold Says Producers Will Make Money In 1923—Maybe as Much as 6 Per Cent

"Coal producers will make some money this year," Dr. F. C. Honnold, secretary-treasurer of the Illinois Coal Operators' Association, told the *Chicago Journal of Commerce* in an interview the other day, "but their profits will not be large. The average company will do well to make 6 per cent on its investment."

Dr. Honnold prophesied that during the next three or four years a considerable number of operating concerns that sprang up mushroom-like during the period of inflation following the war will collapse in bankruptcy, but that many of the larger and stronger companies, having learned some vital truths about their industry by weathering that same period of inflation, will be able to show a fair profit in spite of restricted demand and a general tendency toward reduced prices of coal.

Speaking of Illinois, he said conditions are "not altogether satisfactory." There were then 5,000 cars of unbilled coal on mine tracks. Of these, 1,250 were loads of screenings—sizes that ordinarily are short at this time of year. Illinois mines are operating between 33⅓ and 40 per cent of their capacity as compared with a normal of 85 per cent. As many as fifty Illinois mines are down either temporarily for repairs or for the summer.

Problems of Operating Men

Edited by James T. Beard

Firebosses Who Use Electric Cap Lamps

E'ectric Lamp Gives Good Light—Is Not Extinguished in Bad Air—Expedites Work—Fireboss Can Travel Faster, Examine Larger Territory

REPLYING to William Dickinson's letter condemning the use of electric cap lamps by firebosses, *Coal Age,* March 29, p. 530, permit me to say that I have carried an electric cap lamp in my belt when performing the duties of fireboss and have found it a great advantage.

Like Mr. Dickinson, my experience in firebossing began in England (Lancashire), when such a thing as an electric lamp was not known. However, I feel that it should be impressed on the minds of all mining men that we are becoming more enlightened every day in regard to conditions, methods and appliances that make mining safer.

Found Cap Lamp a Great Advantage

It had always been my practice in firebossing to carry no other light than that of an approved safety lamp, until a few months ago when I came into possession of an electric cap lamp, which I have since carried in my belt when making my rounds in the morning. The lamp gives a good light and enables me to travel faster through abandoned places and, particularly, when climbing over falls.

To my mind, it is ridiculous to argue that the bright glare of the lamp blinds the vision so that the fireboss cannot see the faint gas cap that may form on a safety lamp. The fireboss who knows his business will not carry the electric lamp on his head. Carried in the belt, the light rays are reflected downward and do not hinder or prevent a fireboss from making an accurate test for gas.

On the other hand, the bright light is of great assistance to him if he has to restore a portion of brattice that has been broken down and which the fireboss must replace when making his rounds, in order to keep the place free from gas. If this is not done, the man who works there must be kept out of his place, until the regular bratticeman gets around to do the work.

Avoids Risk of Getting in the Dark

Still another advantage that can be claimed for the electric lamp, in the work of firebossing, is that it avoids the possibility of a man being left in the dark if his safety lamp is extinguished. This often happens when he is compelled to climb to the top of the coal to make a test in a place 10 or 12 ft. high.

It has frequently been my lot to lose my light in such cases. I could not tell whether the flame was knocked out by a jar or extinguished by gas. At those times, however, it was my duty to retreat to a place of safety to relight the lamp. This was generally a difficult thing to do, because of having to travel in the dark, and one can readily understand the advantage of the electric lamp in such a situation.

Let me say, again, that it is time for all mining men to appreciate the advantage there is in these new methods. Suppose a part of a fireboss territory accumulates blackdamp. In passing through such places, he is almost sure to lose his light, whereas if he has an electric lamp hanging to his belt, he need have no fear of being left in the dark wherever he goes.

Frontier, Wyo. JAMES ROBERTS.

ANOTHER LETTER

AFTER reading William Dickinson's letter, which appeared in *Coal Age,* March 29, p. 530, where he claims that, for a fireboss to carry an electric cap lamp with him when making his rounds in the morning, is a dangerous practice, I am inclined to disagree with our friend on that point.

We all realize that an electric cap lamp has no value in the matter of testing for gas. No one questions that fact; but when Mr. Dickinson says that, for a fireboss having a large district to cover, carrying such a lamp "would prove a menace in more ways than one," it is hard to know his reason for making such a statement.

As far as I have observed, his only reason for condemning the cap lamp in firebossing is that a fireboss' time is limited and he has no spare moments to be occupied in hiding his electric lamp when making a test for gas. This appears to me as a very slight pretext for depriving our firebosses of the many advantages to be derived by carrying along an electric lamp when making their rounds.

Can Examine a Larger Territory

Allow me, therefore, to give my reasons why a fireboss should use either an electric cap lamp or a pocket flashlight. In the first place, when examining a large territory, a fireboss will make better time by using the cap lamp. There is no doubt but that he can make a better examination of the roof and sides of all the working places, haulageways and travelingways, in his district, by making good use of the electric lamp he carries.

Judging from the reference Mr. Dickinson makes, with regard to the fireboss having no time to spare to hide his electric lamp when about to make a test for gas, it may be assumed that he is speaking of making a percentage test, which requires the lowering of the flame of the lamp and estimating the height of the cap should any be present.

If that is his practice he must have a small territory to examine. In most instances, I have found it impossible to get around in adopting such measures. Instead, I have used what I would call the accumulative test, by observing the appearance and action of the normal flame. I believe this has afforded equal satisfaction and safety as would be obtained by making a more accurate test to determine the percentage of gas, by lowering the flame and observing the height of the gas cap that may be formed in the lamp.

Reverse Cap When Making Test for Gas

Of course, if a fireboss comes upon a large body of gas it is necessary for him to take more time and examine carefully to ascertain the real conditions of the place. He must then lower his flame and make a careful test. At such times, however, it is an easy matter for him to turn his cap lamp to the side of his head or turn it back so as to shine behind him, whichever he may choose. The radius of illumination of a cap lamp covers but a small area and when the cap is turned about, as I have mentioned, the glare of the lamp will not interfere with the test he makes.

Before closing, I cannot forbear to say that a fireboss who finishes his shift in the condition described by Mr. Dickinson, who says that, after shedding his coat, vest and overshirt, his undershirt and trousers would be wet with the perspiration that poured from his body. This would seem to indicate, then, that our friend did not lose much time in stopping to lower his flame and make a careful test in each place examined, as I had feared. It is my conclusion that all firebosses should carry with them either a pocket flashlight, or an electric cap lamp, when making their rounds. W. W. H.

Clinton, Ind.

Danger in Use of Black Powder

Local explosion in Pocahontas field kills ten men—Miners compelled to use black powder in many of the mines—Need of law requiring exclusive use of permissible powder.

I WAS much impressed with the remarks of "Safety Inspector," writing from Welch, W. Va., whose letter appeared in *Coal Age*, April 19, p. 645, in regard to the relative danger in the working of non-gaseous and gaseous mines. He draws attention to the discussion of explosions occurring in gaseous mines as not being complete without referring equally to the danger of working non-gaseous mines.

Attention is drawn in that letter to the fact that coal dust is a most dangerous factor in the use of explosives. To my mind, this is one point that seems to be given little attention by many writers when treating the subject of mine explosion. This is particularly true where the explosive in use is black blasting powder.

Only a short while ago, there occurred a dust explosion, in the S. J. Patterson mine at Arista, in the Pocahontas field, in this state. The explosion caused the death of ten men, although its effect was comparatively local. According to the evidence gathered, the accident undoubtedly resulted from the accumulation of coal dust in or near the working places. Black powder was in use for blasting in the mine and the accumulated dust had been raised and ignited by the flame of an improper shot.

Any one who has had experience in the use of black blasting powder knows that when shots are fired, the flame not only fills the place but often extends a considerable distance back on the road. No matter how careful a company may be in requiring the loading out of the bug dust and fine coal from all working places, there is always enough fine coal dust that has accumulated in the gob and settled on the ribs and timbers along the road, and this is thrown into suspension in the air by the concussion when a shot is fired.

In fact, if the mine is dry and dusty it is impossible to keep the air free from dust, which is constantly stirred up by the cars being hauled in and out of the mine and by the various operations going on in the workings. It is this condition that makes the use of black powder extremely dangerous, because of the large volume of flame produced in firing.

Since the explosion in the Arista mine, the rule has been adopted in that mine, requiring the exclusive use of permissible powder; but the other mines in that vicinity do not seem to have profited by the lesson. Although these mines are equally dry and dusty and have practically no spraying or humidifying systems installed, they are still permitted to continue using black blasting powder in breaking down the coal. The condition is rendered more particularly dangerous because of the unskilled labor employed and the absence of any rules or regulations regarding the handling of the powder and the charging and firing of the shots.

Strange Indifference to Danger

It is hard to understand the indifference manifested regarding the use of black powder in these mines. In most cases, I would say, that the miners of the Pocahontas field are compelled to use black powder. In some instances even, the use of permissible powder has been positively forbidden by the companies operating the mines. I want to ask, Will our state mining department wait until the horses are stolen, before closing the stable doors?

In my experience I have found most non-gaseous mines ventilated by a single continuous air current, which everyone knows is a poor system of ventilation. Not only that, but those mines seldom have any rules or regulations restricting the time of firing shots, or limiting the amount of the charge, or providing for the inspection of the holes by competent inspectors, before charging and firing.

Instead, the miners are permitted to follow their own sweet will, charging and firing their holes how and when they please. The consequence is that the air currents, in these mines, continually carry a large amount of fine dust and are laden heavily with the smoke and gases produced by the shots. Throughout the shift, the men are compelled to breathe air that is injurious to health, to say nothing of the danger to which they are exposed by reason of a possible explosion occurring in some working place and being extended throughout the mine owing to the explosive condition of the mine air.

In closing, let me say there are several explosives, on the market, that are recommended by the U. S. Bureau of Mines and their use is also advocated by the West Virginia State Mining Department. Why should not the use of these explosives be made compulsory by law? Why should our mines be permitted to take chances with an explosive that has, in many instances, proved extremely dangerous? The subject is certainly worthy of careful consideration.

Springton, W. Va. Mine Worker.

Inquiries Of General Interest

Ascertaining Explosibility of Methane in Oxygen

Explosibility of Methane in Oxygen Mixture Questioned—Lower Inflammable Limit of the Mixture Calculated—Explosive Point Undefined

AT THE meeting of our mining class, the other night, a question arose regarding the explosibility of a mixture of nine cubic feet of methane (CH_4) in fifty cubic feet of oxygen. The question was asked: "Would such a mixture explode when contained in a vessel and a light applied?" Our instructor claimed that there would be no explosion. His reason for this conclusion is not clear to me and I will be grateful to see the matter explained in *Coal Age*. The most of us were inclined to think that this mixture was explosive. STUDENT.

Burnett, Wash.

The question of ascertaining at what point an ignitible gas will explode when the gas is added to an atmosphere of air, or to one of pure oxygen, can only be answered approximately, since the explosion of the mixture will depend not alone on the relative proportions of the gases forming the mixture, but on their uniform distribution, in order to bring about an intimate contact of the respective molecules throughout the entire volume and insure the necessary rapidity of combustion at every point. Much, also, depends on the intensity of the flame or spark producing ignition.

This condition is fully explained in reference to determining the lower explosive limits of methane in air, in *Mine Gases and Ventilation—Beard, Second Edition*, page 98. As there explained, the lack of uniform distribution of the gas in the air is the cause of the sharp snapping and crackling that is at times observed within a safety lamp introduced into a body of sharp gas. Actual explosion depends on the same condition existing throughout the mass of the mixture; but there is always a gradation each way, from the maximum explosive point to the lower and the higher explosive limits of the gas, the intensity of the explosion growing less and less till it ceases altogether.

On the other hand, the theoretical inflammable limit of a mixture of methane and oxygen is readily calculated. It is the point at which the heat generated, per pound of gas, in the complete combustion of the gas, is equal to the heat absorbed by the products of combustion and the excess atmosphere. Beyond this point, the excess of heat generated is manifested in the inflammation of the mixture. Briefly explained, the process is as follows:

The equation representing the combustion of methane (CH_4) in pure oxygen (O_2) is

$$CH_4 + 2O_2 = CO_2 + 2H_2O$$

Molecular weights,	16	64	44	36
Relative weights,	1	4	$2\frac{3}{4}$	$2\frac{1}{4}$

From a table of Heats of Combustion (*Mine Gases and Ventilation*, p. 66), the heat generated per pound of methane, burning to carbon dioxide and water vapor, is given as 23,513 B.t.u. Now, to find the heat absorbed by the products of combustion, carbon dioxide (CO_2) and water vapor (H_2O), multiply the specific heat of each of the products, by its relative weight per pound of methane, and that result by the rise in temperature above 32 deg. F., which in this case is 1,200 — 32 = 1,168, the temperature of ignition of methane being 1,200 deg. F. Then, the specific heat of carbon dioxide being 0.2163, the heat absorbed, per pound of methane consumed is

$$0.2163 \times 2\tfrac{3}{4} \times 1{,}168 = 694.726 \text{ B.t.u.}$$

The specific heat of water being 1, its relative weight in this case $2\frac{1}{4}$ lb. and rise of temperature 212 — 32 = 180 deg., gives for the heat absorbed by the water, $1 \times 2\frac{1}{4} \times 180 = 405$ B.t.u. Again, the latent heat of steam being 970.4 B.t.u. per pound, gives $970.4 \times 2\frac{1}{4} = 2{,}183.4$ B.t.u. absorbed in turning the water into steam. Finally, the specific heat of water vapor being 0.4805, its relative weight in this case $2\frac{1}{4}$ lb., and the rise in temperature of the steam 1,200 — 212 = 988 deg. F., the heat absorbed by the steam is $0.4805 \times 2\frac{1}{4} \times 988 = 1{,}068.152$ B.t.u. This makes the total heat absorbed by the water, converted into steam at 1,200 deg. F., 405 + 2,183.4 + 1,068.152 = 3,656.552 B.t.u., per lb. of methane consumed. The total heat consumed by the products of combustion is, therefore, 694.726 + 3,656.552 = 4,351.278 B.t.u. per lb. of methane consumed.

But, the heat generated being 23,513 B.t.u. and that absorbed 4,351.278 B.t.u., leaves an excess of heat 19,161.722 B.t.u. to be absorbed by the oxygen remaining unburned. In a large atmosphere of oxygen, this heat would be quickly dispersed, making the temperature too low for the ignition of the gas. The point is, therefore, to find what weight of oxygen will be required to absorb this excess heat and give a rise of temperature 1,200 — 60 = 1,140 deg. F., assuming the original temperature of the oxygen atmosphere to be normal, or 60 deg. F.

The specific heat of oxygen being 0.2175, the heat absorbed, per pound, for this rise of temperature is $0.2175 \times 1{,}140 = 247.95$ B.t.u. Therefore, the weight of oxygen required to absorb the excess heat, in the burning of a pound of methane and raising the temperature to the point of ignition of the gas (1,200 deg. F.) is 19,161.722 ÷ 247.95 = 77.2 lb. This makes the total weight of oxygen, per pound of methane burned, 77.2 + 4 = 81.2 lb.

The ratio by weight, methane to oxygen, is then 1:81.2; but the density of oxygen being twice that of methane, the volume ratio is 1:40.6 when inflammation takes place. The volume of the mixture, per unit volume of methane is then 1 + 40.6 = 41.6, and the percentage of gas in the mixture is 100 ÷ 41.6 = 2.4 per cent.

In conclusion, it is observed, in the equation previously given expressing the complete combustion of methane, the maximum explosive point is when the volume ratio, methane to oxygen, is 1:2; or 1 volume of methane in 3 volumes of the mixture, giving 100 ÷ 3 = $33\frac{1}{3}$ per cent of methane. In the proposed mixture of 9 cu.ft. of methane with 50 cu.ft. of oxygen, the percentage of methane is (9 × 100) ÷ 59 = 15.2 per cent. This being somewhat less than one-half the percentage of methane at its maximum explosive point, our judgment is that the mixture is not explosive, under ordinary conditions of ignition.

Examination Questions Answered

Examination for Mine Managers, Springfield, Ill., Mar. 19, 1923

(Selected Questions)

QUESTION—*In a coal field two miles square, both openings are at the lowest point of the property and the seam rises on a grade of 2½ per cent for a distance of 6,000 ft. The depth of strata at the openings is 210 ft. and the surface is perfectly horizontal over the whole extent of the property. The ventilation is produced by a forcing fan 15 ft. in diameter. It is found to be unable to supply the lawful quantity of air at the face of the workings. Therefore, with a view to economy, what means would you adopt to insure the lawful amount of ventilation for the mine?*

ANSWER—Assuming that all possible has been done to increase the circulation by cleaning up the airways, enlarging the breakthroughs, splitting the currents and shortening the distance the air must travel, the next step is to sink an air shaft at the most feasible point back in the workings and near the line of the main headings. The location of this air shaft should be determined by a careful study of the proposed plan of ventilation, so that the entire air current produced by the fan can enter and pass through the mine in two or more direct currents and no return airways will be required. The seam rising on a grade of 2½ per cent for 6,000 ft. will give a total rise in that distance of 6,000 × 0.025 = 150 ft. and make the depth of air shaft required only 60 ft. The sinking of one or more air shafts at convenient points in the workings where the depth from the surface to the coal is but 60 ft. would prove an important factor in the economy of ventilation and the future operation of the mine.

QUESTION—*Explain how you would determine the safe working load for a seasoned hemlock mine prop 10 in. square and 10 ft. long, assuming that the crushing load per square inch is 5,300 lb.?*

ANSWER—A mine prop whose diameter in inches is equal to its length in feet presents, practically, an equal resistance to crushing or bending. Therefore, the strength of a post 10 in. square and 10 ft. long can be estimated on its resistance to crushing. In mine timbering, the safe working load may be taken as one-third of the crushing load or, in this case, ⅓(5,300) = 1,766 lb. per sq.in. The sectional area of the post being 10 × 10 = 100 sq.in., the required safe working load is (100 × 1,766) ÷ 2,000 = 88.3 tons.

QUESTION—*If 65,000 cu.ft. of air is passing through a mine, per minute, what amount of methane must be picked up by the air current to render the return air dangerous?*

ANSWER—Very much will depend on the condition of the mine with respect to dust and the inflammability of the coal. If the air current is free from any appreciable quantity of dust, 2 per cent of methane in the return airway would not be dangerous. The danger line, calling for the adoption of measures to safeguard operations in the mine, may be assumed as reached when the return air contains, say 3 per cent of gas. If the volume of air entering the mine is 65,000 cu.ft. per min., this is 100 — 3 = 97 per cent of the return current under the assumed conditions, making the total volume passing in the return airway, 65,000 ÷ 0.97 = say 67,000 cu.ft. per min. In that case, the volume of methane the air current must have absorbed is 67,000 — 65,000 = 2,000 cu.ft. per min.

QUESTION—*How many tons of coal will be hauled in 8 hr., by an electric motor making 22 trips and hauling an average of 25 cars per trip, if the average net weight of coal, per car, is 4,500 lb.?*

ANSWER—Assuming the motor makes 22 round trips in 8 hr., hauling an average of 25 cars per trip, the average capacity of each car being 4,500 lb. of coal, the weight of coal hauled in the given time is (22 × 25 × 4,500) ÷ 2,000 = 1,237.5 tons.

QUESTION—*What material, in your judgment, should be kept at fiery or gaseous mines to meet emergencies that are likely to arise from explosions of firedamp?*

ANSWER—The mine should be equipped with a trained first-aid team and have on hand the necessary first-aid supplies and apparatus to enable the team to do effective work. This should include an approved type of breathing apparatus and oxygen tanks, together with the necessary bandages, splints, one or more pulmotors and the usual restoratives, olive oil, etc., for the treatment of burns and electric shock. The mine should be equipped with a good underground hospital, supplied with stretchers, blankets and other necessities for the giving of first-aid treatment to the injured. There should also be provided a suitable mine ambulance.

QUESTION—*What device would you use to remove gas from holes and cavities in the roof of rooms and entries?*

ANSWER—No attempt should be made to remove gas from holes and cavities in the roof or other void places, by brushing it out with a coat or other garment. To remove the gas, the air current passing through the place should be suitably increased and a special brattice erected to deflect the air into the hole or cavity in the roof or other void place where it is lodged.

QUESTION—*Do the furnace and fan produce ventilation as well in shallow mines as in deep ones and why?*

ANSWER—The action of a mine furnace depends primarily on the depth of the upcast or furnace shaft. The greater the depth of this shaft, the greater the height of the heated air column, which determines the ventilating pressure in the mine. Hence, furnace ventilation is not as effective in a shallow mine as where the coal lies at a greater depth below the surface.

On the other hand, in fan ventilation, a deep shaft means an increased mine resistance; and a larger proportion of the work of the fan is then absorbed in passing through the shafts. For that reason, a ventilating fan does more effective work in the ventilation of a shallow mine than a deep one.

QUESTION—*Does a high water gage always indicate a large quantity of air passing? What does a low water gage with a large quantity of air passing indicate?*

ANSWER—A high water gage may result from an increased mine resistance due to obstructed airways, and it is, therefore, no index of a large quantity of air in circulation.

When a large quantity of air is circulated under a low water gage, it indicates a small mine resistance, owing to large unobstructed airways.

58 Bids Submitted to Navy Department On 450,000 Tons of Bituminous Coal

Fifty-eight bids were submitted to the Navy Department and opened May 23 for supplying approximately 450,000 tons of bituminous or semi-bituminous coal for delivery at navy yards and naval stations during the fiscal year beginning July 1, next. Three bids were informal and were thrown out. They were those of the Lake & Export Coal Corporation, Huntington, W. Va.; Raleigh Smokeless Fuel Co., New York, and Coleman & Co., Philadelphia. The principal remaining bids were as follows:

30,000 tons, for delivery at Boston—Dexter & Carpenter Co., New York, $7.58 per ton, f.o.b. Navy Yard; Maritime Coaling Co., East Boston, $8.55, barge delivery W. A. Marshall & Co., New York, $7.41, rail delivery; Matlack Coal & Iron Co., New York, $7.39, rail delivery; Metropolitan Coal Co., Boston, $9.35, truck delivery; Weston Dodson & Co., Bethlehem, Pa., $9.22, rail delivery.

6,000 tons, for delivery at Chelsea, Mass.—Metropolitan Coal Co., $9.55 per ton; Weston Dodson & Co., $11.72.

9,000 tons for delivery at Brooklyn, N. Y.—Cosgrove & Co., Johnstown, Pa., $6.57 per ton; H. B. Haff, New York, $7.31; George D. Harris & Co., New York, $6.30; W. A. Marshall & Co., $7.02; Matlack Coal & Iron Co., $6.57; Morrisdale Coal Co., Philadelphia, $7; Pennsylvania Coal & Coke Corp., New York, $3.92; Quemahoming Coal Co., Somerset, Pa., $7.42, alternate $7.28, $7.05, $6.92 and $6.76; Titan Fuel Corp., New York, $6.49; Weston Dodson & Co., $8.22.

57,500 tons, for delivery at New York—W. H. Bradford & Co., Inc., Philadelphia, $6.19 per ton at coal pier, New Jersey, $6.44 at coaling plant, Brooklyn. $6.49 at Brooklyn naval hospital; Burns Bros., New York, $7.04 at coal pier, New Jersey, $7.39 at Brooklyn coaling plant, $7.39 at Brooklyn naval hospital; Consolidation Coal Co., $7.02 at New Jersey coal pier, $7.24 at Brooklyn coaling plant, $7.29 at Brooklyn naval hospital; Cosgrove & Co., Johnstown, Pa., $6.23 at New Jersey coal pier; Dexter & Carpenter Co., New York, $6.51 at New Jersey coal pier, $6 74 at Brooklyn coaling plant, $6.79 at Brooklyn naval hospital; W. A. Marshall & Co., $6.145 at New Jersey coal pier, $6.345 at Brooklyn coaling plant; $6.395 at Brooklyn naval hospital; Morrisdale Coal Co., $6.09 at New Jersey coal pier, $6.45 at Brooklyn coaling plant, $6.45 at Brooklyn naval hospital; Seiler Coal Co., New York, $6.54 for entire amount, $6.42 for part, at New Jersey coal pier, $6.78 for all, $6.65 for part, at Brooklyn coaling plant, $6.83 for all. $6 70 for part, at Brooklyn naval hospital; Titan Fuel Corp., $6.09 at New Jersey coal pier, $6.34 at Brooklyn coaling plant or naval hospital; Weston Dodson & Co., $8.74 at New Jersey coal pier, $9.74 at Brooklyn coaling plant or naval hospital; H. B. W. Haff, $7.18 at Brooklyn coaling plant or naval station.

45,000 tons, for delivery at Philadelphia—Cosgrove & Co., $6.19; Davis Coal & Coke Co., $6.44; Dexter & Carpenter Co., $6.54; Emmons Coal Mining Co., $6.46; Fidelity Coal Mining Co., Philadelphia, $5.83; W. A. Marshall & Co., $5.71; alternate $5.85; Maryland Coal & Coke Co., Philadelphia, $5.92; alternate $6.09; Matlack Coal & Iron Co., $5.99; Pennsylvania Coal & Coke Corp., $3.92; Weston Dodson & Co., $8.84; Whitney & Kemmerer, Philadelphia, $6.37.

20,000 tons, for delivery at Philadelphia—W. H. Bradford & Co., Inc., $6.06 at coaling piers, $6.24 at wharf; Dexter & Carpenter Co., $6.29 at coaling piers, $6.44 at wharf; Empire Coal Mining Co., $6.23 at pier, $6.41 at wharf; Fidelity Coal Mining Co., $5.56 at pier, $5.72 at wharf; W. A. Marshall & Co., $5.645 at pier, $5.78 at wharf; Maryland Coal & Coke Co., $5.67 at pier, $5.84 at wharf; Morrisdale Coal Co., $5.52 at pier, $5.67 at wharf; Quemahoming Coal Co., $6.04 at pier, alternate $6.17 $6.40 $6 54, $5.88, $6.22 at wharf, alternate $6.35, $6.58, $6.72, $6.06; Weston Dodson & Co., $8.59 at pier, $9.59 at wharf; Whitney & Kemmerer, $6.12 at pier, $6.24 at wharf.

35,100 tons, for delivery at Annapolis, Md.—Davis Coal & Coke Co., $6.94; Dexter & Carpenter Co., $6.50; Hall Bros. Co., Inc., Baltimore, $6.70; Hulmer Coal & Transportation Co., Philadelphia, $7.04; Iron Trade Products Co., Pittsburgh, $6.84; alternate $7.25; W. A. Marshall & Co., $6.71; Quemahoming Coal Co., $6.59; alternate $6.57, $6.72, $6.95, $7.09, $6.43; Weston Dodson & Co., $9.59.

50,000 tons, for delivery at Washington, D. C.—C. G. Blake Co., Cincinnati, $7.32 per ton; Davis Coal & Coke Co., $6.64; Dexter & Carpenter Co., $6.32, alternate $6.14; Low Volatile Consolidated Coal Co., Beckley, W. Va., $7.88 (25,000 tons); W. A. Marshall & Co., $6.20; Matlack Coal & Iron Co., $6.04; Pennsylvania Coal & Coke Corp., $6.76; Quemahoming Coal Co., $6.79, alternate $6.42. $6.29; Weston Dodson & Co., $8.84; White Oak Coal Co., Macdonald, W. Va., $7.06 (25,000 tons).

33,000 tons, for delivery at Indian Head, Md.—Davis Coal & Coke Co., $7.41 per ton, alternate (12,000 tons), $6.77; Emmons Coal Mining Co., $7; Fidelity Coal Mining Co., $6.19; W. A. Marshall & Co., $7.25; Matlack Coal & Iron Co., $6.59; Weston Dodson & Co., $8.91.

10,000 tons, for delivery at Indian Head, Md.—Consolidation Coal Co., $7.30 per ton; Davis Coal & Coke Co., $7.14; Emmons Coal Mining Co., $6 57; W. A. Marshall & Co., $7.22; Matlack Coal & Iron Co., $6.59.

10,000 tons, for delivery at Dahlgren, Va.—Dexter & Carpenter Co., $6.49 per ton, rail delivery; W. A. Marshall & Co., $6.68 rail delivery, $6.82 barge delivery; Matlack Coal & Iron Co., $6.59, rail delivery; Weston Dodson & Co., $8.91, rail delivery.

22,000 tons, for delivery at Hampton Roads, Va.—C. G. Blake Co., $6.88 per ton; Dexter & Carpenter Co., $6.18, alternate $6 11; Fayette Smokeless Fuel Co., $7.28; L. A. Snead Co. $7.15; Weston Dodson Co., $8.02; White Oak Coal Co., $7.45 (12,000 tons).

45,000 tons, for delivery at Norfolk—Crozer Pocahontas Co., Philadelphia, $7.45 per ton (22,500 tons); Dexter & Carpenter Co., $5.73, alternate $6.18, $6.11; Fayette Smokeless Fuel Co., $6 88; Low Volatile Consolidated Coal Co., $8.008; Pocahontas Fuel Co., Inc., New York, $7.44; L. A. Snead Co., $7.15; Weston Dodson & Co., $8.47; White Oak Coal Co., $7.773 (24,000 tons).

5,500 tons, for delivery at Portsmouth, Va.—C. G. Blake Co., $6.88; Dexter & Carpenter Co., $6.18, alternate $6.11; Fayette Smokeless Fuel Co., $7.28; Pocahontas Fuel Co., Inc., $7.44; L. A. Snead Co., $7.25; Weston Dodson & Co., $8.47.

10,000 tons, for delivery at Charleston, S. C.—C. G. Blake Co., $7.83 per ton; Crozier Pocahontas Co., $7.84; Dexter & Carpenter Co., $6.53, alternate $6.46; Wm. Johnson & Co., Charleston, $7.52; Pocahontas Fuel Co., Inc., $7.834; Roach Creek Coal Co, $5.85 (5,000 tons); Sloss Sheffield Steel & Iron Co., Birmingham, Ala., $6.30; L. A. Snead Co., $7.54.

8,700 tons, for delivery at Pensacola, Fla.—Adams, Rowe & Norman, Birmingham, $3.03, alternate $3.31; Cary & Co., Pensacola, $3.60, alternate $3.33; Frederick Gilmore & Co., Pensacola, $3.67; John A. Merritt & Co., Pensacola, $5.99, alternate $5.44, $5.37; National Coal & Coke Co., Birmingham, $2.25; Roach Creek Coal Co., $3; Sloss Sheffield Steel & Iron Co., $3.

2,000 tons, for delivery at Great Lakes, Ill.—Baumer Coal Co., St. Louis, $2.76; Chicago, Wilmington & Franklin Coal Co., Chicago, $3.64, alternate $3.08, $2.80; Cosgrove & Co., $3.30; Crear & Clinch Co., Chicago, $3.35; Dexter & Carpenter Co., $8.45, alternate $8.16; B. W. Gilmore & Co., Chicago, $3.24, alternate $3.90; Great West Coal & Lumber Co., Chicago, $3,248; Howl-Coulter Coal Co., Chicago, $3.36; Lake & Export Coal Sales Corp., Chicago, $2.65; O'Gara Coal Co., Chicago, $3.64; Old Bend Coal Corp., Chicago, $3.64; Peabody Coal Co., Chicago, $3.64; Reliable Coal & Mining Co., Chicago, $2.688; Roach Creek Coal Co., $3; Richardson Sons, Chicago, $2.91.

30,000 tons bituminous screenings, for delivery at Great Lakes, Ill.—Baumer Coal Co., $1.87; Chicago, Wilmington & Franklin Coal Co., $1.95, alternate $1.90; Cosgrove & Co., $2.15; Crear & Clinch, $2.07; Dexter & Carpenter Co., $7.60; B. W. Gilmore & Co., $2.17, alternate $2.57, $2.69; Great West Coal & Lumber Co., $2.52; Howl-Coulter Coal Co., $1.79; Lake & Export Coal Sales Corp., $1.75; O'Gara Coal Co., $2.69; Old Bend Coal Corp., $1.96; Peabody Coal Co., $1.96; Reliable Coal & Mining Co., $1.792; Roach Creek Coal Co., $2.05 (10,000 tons); Richardson & Sons, $2.52.

Convention Program of American Wholesale Coal Association Nearly Complete

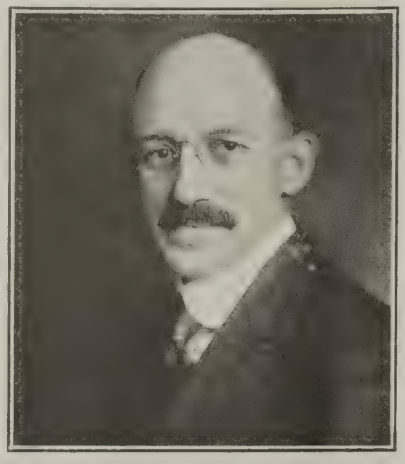
The program of the seventh annual convention of the American Wholesale Coal Association, to be held in Cincinnati June 12-13, is nearing completion. The Executive Committee and Senior Council held a two days session with President Morton at Albany, N. Y., on May 10 and 11 to complete the plans for the annual convention and transact other business. The program was discussed thoroughly and

EXECUTIVE COMMITTEE AND SENIOR COUNCIL, AMERICAN WHOLESALE COAL ASSOCIATION

Top row—Borden Covel, Boston; Ira Cochran, commissioner and traffic manager, Washington; Charles A. Owen, New York City. Middle row—C. G. McGill, Toronto; Charles L. Dering, Chicago; Russell K. Pratt, Boston; C. F. Dunn, Detroit. Bottom row—E. M. Platt, Chicago; Jay W. Johns, vice-president, Pittsburgh; Seth W. Morton, president, Albany, N. Y.; G. H. Merryweather, secretary-treasurer, Chicago; Charles L. Couch, Buffalo.

efforts are being made to have a number of speakers who will be both entertaining and instructive. Considerable time will be allotted for discussion of the problems of the association in connection with the reports of the officers for the past year. The policy of the association for the future will, of course, be determined.

Plan to Certify American Coal for Export



A start toward the establishment of export standards for coal was made at a conference in Washington May 24. Representatives of the railroads, the exporters and the government—in all some twenty-five persons—were called to Washington by Federal Fuel Administrator Wadleigh. The meeting was called with the approval of prominent producers of export coal.

Under the plan proposed the Bureau of Mines will certify to any foreign buyer the name of the district, the designation of the seam and the commercial name of the coal involved. While this falls far short of the standards of quality that many would apply on export coal, it is believed that this is a step toward safeguarding foreign buyers and reputable exporters from the poor quality of coal some exporters palm off on foreign buyers.

Commission Prefers Contact with Men Active in Industry; No Objection to Representation by Counsel

By Paul Wooton
Washington Correspondent of *Coal Age*

John L. Lewis, president of the United Mine Workers of America, appeared before the President's Coal Commission on May 25. No announcement was forthcoming from the commission as to what Mr. Lewis discussed. The usual Friday conference with the press was cancelled. It is understood, however, that Mr. Lewis confined himself largely to a discussion of conditions in Europe, particularly as they have a bearing on the coal situation. Since coal is such an important factor in Great Britain's ability to compete in world markets, the discussion is understood to have dealt with the broader aspects of the part played by British coal in foreign trade.

A. E. HOLBROOK

Most of the week ended May 26 was devoted by the Coal Commission to conferences with the members of its staff. The various staff reports due June 1 are of unusual importance as the study of the anthracite situation, which is to be reflected in the July 1 report, is now converging to the point where conclusions are being formulated.

A report was circulated to the effect that the Coal Commission had practically served notice on the United Mine Workers that it wants to hear from the union's officials rather than from any legal talent in its service. It was stated by a member of the commission that there is no intention whatever of dictating to anyone how he shall present his case. It is perfectly obvious that the commission prefers hearing from actual operators and from union officials rather than from attorneys, regardless of how distinguished they may be. Nevertheless it is safe to say that the commission will interpose no objection to the appearance of counsel. It may be predicted, however, that the commission will insist on addressing many of the questions which it has to ask to those actually engaged in the industry.

Apparently the commission understands that the briefs submitted to it most recently were intended for public consumption rather than for judicial consideration by the commission. Only one member of the commission seemed to be at all familiar with the material contained in these statements and it is suspected that he was assigned to read them so as to ascertain whether or not they really were intended for the commission's consideration.

The three anthracite district presidents of the United Mine Workers of America have been called to Washington for a conference with International President John L. Lewis and also with the Coal Commission. Thomas Kennedy of Hazleton, president of District 7, despite illness which had confined him to his home all week, left Saturday night in response to the call.

The Coal Commission has drafted Mr. Holbrook, now dean of the School of Mines, Pennsylvania State College, formerly assistant director of the Bureau of Mines, to investigate and report on safety methods in the coal mines. Mr. Wolflin, of the State Industrial Commission of California, and Mr. Rutledge, mining engineer of the State of Maryland, are assisting Mr. Holbrook.

Tentative Awards Made for Furnishing Coal To New York State Institutions

Bids opened on May 22 by the New York State Department of Purchases for furnishing and delivering between July 1, 1923, and April 1, 1924, approximately 167,000 net tons of bituminous slack, run-of-mine and three-quarter lump coal to various state institutions resulted in tentative awards being made on a basis of mine prices ranging from $1.75 to $1.80 for slack, $2.18 to $2.58 for run-of-mine and $2.59 for the three-quarter lump. For supplying 640 tons of smokeless coal George D. Harris & Co., of New York City, was awarded the contract at $2.45 per ton.

The specifications called for not more than 9 per cent of ash; sulphur not to exceed 2 per cent; volatile not to exceed 35 per cent, and not less than 13,750 B.t.u., which was interpreted to be the equivalent of good pool 11.

Pool 11 was quoted on May 21 on the New York market at $1.85 to $2.30 net ton f.o.b. mines.

George Hall Corporation, of Ogdensburgh, obtained the contract for delivering 13,600 net tons of run-of-mine to St. Lawrence Hospital at $2.54 per ton. Other awards made included 12,000 tons of run-of-mine to the Manhattan State Hospital to George D. Harris & Co., New York City, at $2.49 per ton; 22,500 tons run-of-mine to Central Islip to State Coal Co., Inc., New York City, $2.18; 1.200 net tons of three-quarter lump to Iroquois to Titan Fuel Co., New York City, $2.59 per ton; 2,000 tons of slack to the Binghamton State Hospital to W. A. Marshall & Co., New York City, $1.75 per ton; 10,400 net tons of slack to Buffalo institutions to the Operators Fuel Agency, Greensburg, Pa., and Weaver Coal Co., Buffalo, at $1.80 and $1.84 respectively, award depending on trial shipments. Other contracts awarded included the following: Finance & Fuel Co., of DuBois, Pa., for delivering 30,600 tons of run-of-mine to eight different institutions in northern New York at $2.48 per ton; Barnet Coal & Coke Corp., Buffalo, 18,800 tons run-of-mine to Middletown, Elmira and Sonyea at $2.58 per ton; J. P. Burton & Co., Cleveland, Ohio, 14,300 tons run-of-mine to Rochester, Albion, Batavia and Thiells, at $2.35 per net ton; Titan Fuel Corp., New York City, 4,300 tons nut and slack to the institution at Newark at $2; 1,600 net tons run-of-mine to Napanoch to Steamship Fuel Corp., New York City, $2.50, and 11,600 net tons run-of-mine to Great Meadow and Sing Sing prisons to W. G. Morton, Albany, at $2.20 per net ton.

At the same time bids were opened for furnishing and delivering approximately 104,000 gross tons of various sizes of anthracite to institutions in various parts of the state, of which the D. L. & W. Coal Co. obtained awards at company circular of 29,800 tons of No. 1 buckwheat; 20,000 tons No. 2 buckwheat; 8,500 tons No. 3 buckwheat, 1,755 tons chestnut, 2,200 tons egg, 6,880 tons stove and 4.135 tons pea coal.

The National Coal Association is now housed in its new quarters in the Southern Building at Washington. More floor space is provided than in the old quarters and much more desirable arrangement of the office is possible. Harry L. Gandy, executive secretary of the association, is making a field trip during which he will visit a number of the coal associations in the Middle West.

The Egyptian State Railways are negotiating for 150,000 tons of American coal, it is understood.

Court Confirms Reading Segregation Plan

The U. S. District Court at Philadelphia on May 22 confirmed the third modified plan for the segregation of the Reading companies and ordered counsel to submit a decree for approval of the court. The decree is to be presented by June 20. The court dismissed the exceptions noted to the third plan by certain of the common stockholders and by the government. The court, however, reserved jurisdiction to trustee the coal stock as suggested by the government if there should be an unexpected delay in working out the dissolution proceedings.

Under the provisions of the plan just approved the Reading Company would issue $63,000,000 in 4½ per cent bonds to run seventy-four years, and the Philadelphia & Reading Coal & Iron Co., divorced from the Reading Company under a decree of the U. S. Supreme Court, would issue $31,000,000 in 5 per cent bonds to run fifty years. These bonds would be exchanged for the present 4 per cent bonds.

Objections to the plan had been made by the government and by a large number of common stockholders of the Reading companies and some of the preferred stockholders. They were based chiefly on the grounds that the plan favored the bondholders and that its adoption would mean an increase in anthracite price to the consumer.

The Reading case has been in the courts for sixteen years and has been in the Supreme Court three times. In arguing the case for the government two weeks ago Acting Attorney General A. T. Seymour intimated that if the plan were approved an appeal might be taken to the Supreme Court.

Ask Support of Public to Preserve an Independent Source of Fuel Supply

The public is called upon to give its support to the preservation of an independent source of fuel supply, and to show its appreciation of the loyal services of the mine managers and workers in the non-union coal fields during the last strike in a resolution adopted at the last session of the annual convention of the National Association of Manufacturers, held in New York City on May 14, 15 and 16. The resolution, which was presented by M. C. Atkins, of Indianapolis, chairman of the Committee on Resolutions, pledges the co-operation of the association to the U. S. Fuel Commission. It reads:

"The uninterrupted production and distribution of coal at reasonable cost is vital to our national health, safety and industry.

"With more than half of the world's coal supply within our borders, coal never became a serious problem until after attempts at governmental regulation and organized combinations to interrupt production.

"The significant words of the President of the United States, who recently declared to Congress, 'The simple but significant truth was revealed that except for such coal as comes from the districts worked by non-organized miners, the country is at the mercy of the United Mine Workers,' call for an expression of appreciation on behalf of the people of the nation of the loyal services of the managers and employees of the non-union fields, who by their uninterrupted and effective labors preserved the households, transportation and productive industry of the United States from deprivation of essential fuel.

"It is therefore in the public interest that continuing support be given to the preservation of an independent source of fuel supply, which no combination can arbitrarily close to the needs of our people.

"We extend our co-operation to the U. S. Fuel Commission and urge upon its attention that no form of collective bargaining or agreement can receive public approval that is not accompanied by practical guarantee for its interpretation and the enforcement of its terms by independent adjudication in the event of disputes. It is recommended for thoughtful consideration that all such agreements by their terms include provision for their filing in established courts of record and in the event of dispute as to their meaning be subject to judicial interpretation, to which interpretation the parties thereto agree in advance to be bound."

At the morning session of the convention the delegates listened to an address by former Governor John J. Cornwell, of West Virginia, on "The Coal Situation," an abstract of which was printed in *Coal Age*, May 17.

Government Fuel Yard Makes Awards

The U. S. Bureau of Mines announced on May 21 the awarding of contracts for supplying bituminous coal to the Government Fuel Yards in Washington during the coming fiscal year. The awards, so far as made, are on the basis of the bids opened on May 15 and are as follows: Chesapeake & Potomac Fuel Co., 15,000 tons New River run of mine at $4.30 per gross ton, f.o.b. mines; Fayette Smokeless Fuel Co., 30,000 tons New River run of mine at $4.31 per ton, f.o.b. mines; White Oak Coal Co., 36,000 tons New River run of mine at $4.48 per ton, f.o.b. mines; Commercial Coal Mining Co., 30,000 tons Pennsylvania run of mine at $3.64 per ton, f.o.b. mines; Consolidation Coal Co., Maryland run of mine at $7.50 delivered in barges.

W. M. Wilshire Becomes Vice President Of Carnegie Coal Co.

W. M. Wilshire has resigned as general manager of sales for the Consolidation Coal Co., New York, to become vice-president in charge of sales for the Carnegie Coal Co., Pittsburgh. The Carnegie Coal Co. has been reorganized by its president, John A. Bell, who has merged with it other extensive coal acreage and operations in the Pittsburgh district, generally known as the Bell properties. This company now has a normal productive capacity of upward of five million tons a year. As the head of the sales department of the Carnegie Coal Co. Mr. Wilshire succeeds J. T. M. Stoneroad, who is retiring from active participation in the business, his interest having been purchased by Mr. Bell, as recently announced in *Coal Age*.

W. M. WILSHIRE

For the past twenty-three years Mr. Wilshire has been associated with the Watson interests operating in West Virginia and other fields. In the sales department of the Consolidation Coal Co. he has participated actively in this company's aggressive market and trade development.

William Mann Wilshire was born and reared in Cincinnati, his grandfather having been a pioneer of the Queen City. His first schooling which led to his career in the coal business was had with the late Andrew Stevenson, then assistant general freight agent of the Baltimore & Ohio R.R. at Baltimore. In 1897 Mr. Wilshire became private secretary to the late Oscar G. Murray, at that time, with Judge John K. Cowan, a co-receiver, and subsequently president of the Baltimore & Ohio system. In this position Mr. Wilshire succeeded his brother, F. W. Wilshire, who is now vice-president in charge of sales for the Consolidation Coal Co. In 1900 W. M. Wilshire went to Chicago with the title of traffic manager for the Fairmont Coal Mining Co. From Chicago he went to Baltimore and from there to Philadelphia, as assistant to F. W. Wilshire, who was then manager of the Consolidation Coal Co. at Philadelphia, and whom he succeeded. He was in charge of the Philadelphia office, which is a most important post in the organization, for a dozen years, moving to New York in 1920 to become general manager of sales.

Convention of Michigan-Ohio-Indiana Coal Association Discusses Problems of the Retailer

(Special Correspondence)

Summed up from beginning to end, segregating the social side from the speeches, the reports from the election of officers and the general commingling of two or three elements of the coal industry, a most necessary factor to the well-being of the trade, probably the most progressive action taken at the meeting of the Michigan Ohio-Indiana Coal Association at its sessions at Cincinnati May 22, 23 and 24, was contained in the set of resolutions offered by Charles Albright, of Cleveland, as chairman and drafted by the Resolutions Committee, composed of Mr. Albright, H. H. Deam, of Bluffton, Ind.; J. A. Van Buelen, of Grand Rapids, Mich., and Louis O'Connell, of Tiffin, Ohio.

These show a tremendous breadth of thought upon the coal retailer's problems and, briefly, call for printing of the names of the railroads on which the coal men's yards or sidings are located on their firm's stationery; compilation by members of a list of dealers in their city or district who would be acceptable as members of the organization; a record of each member's average yearly tonnage in anthracite and bituminous coal so that this data may be kept fresh for use when called for by state or federal investigating bodies; immediate notification of station agents or railway officials of empty cars on sidings or in the yards to keep equipment moving; a move to deter dealers from advancing any money for the delivery of coal other than through the deposit of a certified check on receipt of the bill of lading or the placing of this in the hands of his bank until the receipt of the bill of lading; condemnation of any sharp practice by which trade marks or any other evidence of special coals might be placed in fuel produced elsewhere or by other companies so that deception is practiced; against criticism of operators, wholesalers or any other branch of the trade, for the reason that all branches of the industry have a hard enough time to attend to their own business; formation of a committee of five from each of the three states to iron out car-shortage tangles and an endorsement of Secretary Hoover's endeavors along that line with the appointment of emergency transportation committees to assist in this work; a state and national affairs committee in each state so that the members of the organization can keep in touch with the moves for the betterment of the industry in other places.

Five Hundred Present at Opening

Over five hundred registrations were received at the convention headquarters by Wednesday morning, when President Robert S. Magee of the Cincinnati Coal Exchange formally welcomed the visitors. President Homer C. Gill replied and the first speaker was Tom L. Lewis, of Charleston, W. Va., secretary of the New River Coal Operators Association. He spoke on "What Is the Matter with the Coal Industry?" In part he said:

"If I were to try to tell you all that there is the matter with the coal trade it would take me a week. Let's understand that this is one of the greatest basic industries in the United States and ranks second to agriculture.

"One of the great troubles with the coal man is that he has failed to recognize the power of interchange of thought—he has for years overlooked the power of organization. Operator, wholesaler and retailer each has lived in his own little world, each man for himself.

"In 1896 I worked in eastern Ohio for $1.32 a day—they were loading coal in southern Illinois in those days for 10c a ton. Compare that with the present mining costs, and you will see why the miners were forced to organize and why three-quarters of the producers of that time were facing bankruptcy. I helped to organize the Miners' Union because I believed in education, conciliation and arbitration and respect for other people's rights.

"The reason that I am now opposed to miners' organizations is that they do not believe in any one of these, but recognize only one power, and that is might. In the past four years the United Mine Workers have defied the United States, from the President on down, and they have taken two Presidents by the throat and said, 'You must surrender,' even though it was at a cost of the suffering of the people of this country.

"The result of this strife and strikes has been the formation of the President's Coal Commission, in which I have the utmost confidence. The members, I believe, will present all of the facts and will make a report that will solve some of the problems."

Following his talk came J. A. Morris, chairman of the Operating Committee of the American Railway Association. He declared that within three months work would be started upon the Cincinnati terminals that would provide adequate facilities for the movement of all coal produced below the Ohio River through the Cincinnati gateway.

"You gentlemen are interested in the question of car supply," said Mr. Morris. "I might say to you that if there was such a thing as a 100 per cent car supply we couldn't handle it. There are plenty of reasons why there is no such a thing as a 100 per cent car supply, and as one instance I might say that there is one coal dealer in Cincinnati right now who has 163 cars on track that he can't move."

In the afternoon those visiting the convention were taken on a sightseeing trip of the city and in the evening the Cincinnati Coal Exchange was the host to the convention-ers at the Zoo.

Morrow Gives Glimpse of Coal Outlook

Thursday's sessions opened with a talk by J. D. A. Morrow, president of the Morrow Callahan Coal Co. and better known through his association with Dr. Garfield's Fuel Administration and later with the National Coal Association. In his characteristic way Mr. Morrow summed up the evidence to give a glimpse of the coal outlook. He ran down through the essential industries, through the railway ramifications, through the textile, auto and other basic industries and showed that all of them in April and May were working at top speed, in some instances at higher velocity than they were in war times or the armistice period. Coming to the building trades he said that it was true that there had been cancellations of a hundred million dollars worth of work this month, "but we have come to the strange place that it is the cancellation of these contracts that makes news," he said.

He showed that the cost of living is really lower than it was in 1920 and that work is more plentiful, that there is a downward trend to the price of stocks in Wall Street—always a sign that some one is taking a profit—so with the cost of living down and wages up, according to his reasoning, the general purchasing power of the individual in this country is increased and matters generally are in good shape.

All the way through Mr. Morrow kept close to the effect of all of this upon coal. He showed that there was a grave possibility of the transportation facilities of the country being unable to handle the coal mined, that consumption is keeping pace with production to the point that no immense reserves can be built up.

"There are plenty of mines and plenty of labor; the big question is whether labor will work or not. Remember the anthracite agreement expires Sept. 1. Of course the Coal Commission is on the job and we are relying on it to keep things moving. Whether they will or not I do not know and I doubt if they know—without asking John Lewis first—then there is the probability of trouble looming up on April 1. All of this casts its shadows before it. There are the pessimists and the optimists—both advance their own causes and theories. It is my opinion that in four or five weeks the situation will have so straightened itself out that one can see what is ahead of the coal man for the coming year."

Following Mr. Morrow's talk came the passing of the resolutions and then the nominating committee, composed of

Raymond B. Mathers, of Richmond, Ind., chairman; M. J. Hornberger, of Youngstown; Harry Eberts, of Wyandotte, Mich., and Dewey Blocksma, of Grand Rapids, reported the choice of the following: For President, H. W. Barknecht, of Muskegon, Mich., Vice-President, Louis, O'Connell, of Tiffin, Ohio; Secretary, B. F. Nigh; Trustees, Homer C. Gill and Charles Albright, Ohio; D. T. Rolf and H. H. Deam, Indiana; C. A. Pollock and William Donker, Michigan, all of whom were elected unanimously.

The closing event of the convention was a trip down the Ohio River on the excursion steamer "East St. Louis" as guests of the Philadelphia & Cleveland Coal Co., to its big plant recently installed between North Bend and Addyston, where the details of the machinery placed there was explained by Resident Manager Parsons and his assistant Ernie Spreen.

"New Deal" in Northwest Trade?

If half the subtle predictions which are at large within coal circles in the Northwest are correct, it makes little difference what the Interstate Commerce Commission's ruling on the Northwestern rate case may be; there is going to be a new deal in the coal business. Some of the rail trade declare that the sole basis of the complaint was that the dock interests had such a large investment in the docks that it must be protected, even at the cost of upholding uneconomical methods. They declare that if the dock trade cannot meet all-rail competition it is because they have too heavy an overhead through obsolete methods.

They further suggest that it is not impossible for the rail trade to enter the dock business, shipping Illinois and Indiana coal to Lake Superior docks for storage during the summer, and distributing it through the late summer and autumn at a cost below the Eastern coal prices. This is said to be seriously under consideration. Some doubt its practicability since they believe that Middle Western coal will not stand the loading and unloading because of breakage and expensive degradation. But the rail men predict confidently that a victory for the dock contention merely means new competition for them to combat.

Anthracite Production Down 50 Per Cent; Fewer Workers and Workdays Reported

Pennsylvania's anthracite mines last year produced but 40,134,561 tons of coal, or slightly less than one-half of the total amount turned out by the mines in 1921. The decline in output was due to the strike of mine workers, lasting five months. The figures on the anthracite industry were completed last week by the bureau of statistics and information of the Pennsylvania Department of Internal Affairs.

These figures show that the anthracite produced last year in the ten counties where it is mined had a value of $232,765,500 at the mines, while in 1921 the value of the coal at the mines was $481,261,100. Last year the mines worked on an average of 143 days while in 1921 the average number of days worked reached 217. There were 140,353 employees last year, as compared with 166,831 in the preceding year. Of the total employees last year, 68,162 were Americans white, 174 were Americans colored and 72,017 were foreigners. The mine workers were paid last year a total wage of $140,111,600. The total payroll in 1921 was $283,968,700. The capital invested in the operations last year amounted to $339,495,800. Of the total value of the coal produced in 1922, coal valued at $173,313,200 was shipped outside of Pennsylvania. During last year 29,692,602 tons of anthracite was shipped out of the state. In 1921 the value of the coal shipped outside of the state was $390,829,000.

These figures afford some interesting deductions. On the basis of the state's report it appears that:

For every ton of coal the labor cost (wage bill) was $3.49.

Out of every dollar received for coal (value at the mine) 60.2c. was paid out for wages.

Average daily wages for mine workers, all classes, was $6.98.

Average annual earnings—in a year which included a strike of 164 days—were $998.

After paying wages the operators had remaining from coal revenue a sum equivalent to but 27.29 per cent of the investment reported by the state, out of which margin all expenses for supplies, management and superintendence, taxes of all sorts, sales and interest had to be met.

Luzerne County led the other anthracite counties of the state last year with a production of 14,776,698 tons valued at $91,917,700. Schuylkill County stood second with a tonnage of 11,405,669 valued at $60,555,200.

The average days the mines were in operation, number of employees, total wages and the value of the production last year by counties follows:

Counties	Average Days in Operation	Average No. of Employees	Total Wages	Value of Production
Carbon	160	5,177	$5,757,600	$8,591,300
Columbia	134	1,463	1,243,900	2,849,300
Dauphin	180	1,790	1,916,700	2,642,400
Lackawanna	146	25,437	24,794,400	41,690,000
Luzerne	134	53,164	51,488,100	91,917,700
Northumberland	146	13,606	14,478,300	20,421,500
Schuylkill	151	37,173	38,078,000	60,555,200
Sullivan	151	754	548,000	1,034,200
Susquehanna	179	996	984,600	1,392,800
Wayne	143	793	822,000	1,671,100

Burns Bros. Merger Plan Ready

M. F. Burns, president of Burns Brothers, made public on May 23 the complete plan for the recapitalization of Burns Brothers and the agreement of the merger of the properties with the National Coal Corporation, in a letter to stockholders calling a special meeting for June 14 to vote approval of the proposal.

Under the plan only two classes of stock of the new company will be outstanding, against four classes now outstanding. Of the present outstanding stock both classes of preferred will be retired and the Class A and B common stocks will be exchanged for 8 per cent cumulative preferred and common stock of the new company.

The proposed conditions of the merger in respect of exchange of stock are as follows:

(a) The new company will pay to the holders of the prior preference stock of Burns Bros. $120 per share and all cumulative and unpaid dividends thereon and an amount equal to a dividend at the rate of 7 per cent per annum from the last dividend date to the date set for the surrender thereof in a notice to be given as provided in the agreement of merger.

(*b*) The new company will pay to the holders of the preferred stock of Burns Bros. $110 per share and all cumulative and unpaid dividends thereon and an amount equal to a dividend at the rate of 7 per cent per annum from the last dividend date to the date set for the surrender thereof in a notice to be given as provided in the agreement of merger.

(*c*) The holders of the Class A common stock of Burns Bros. will receive in exchange for each share of such stock one share of 8 per cent cumulative preferred stock of the new company of a par value of $100 and one share of the common stock of the new company.

(*d*) The holders of the Class B common stock of Burns Bros. will receive in exchange for each share of such common stock one share of the common stock of the new company.

The capitalization of the new company will consist of $10,000,000 par value preferred stock and 500,000 shares of common stock. Of the common stock 25,000 shares have been issued at a nominal price to managers of the company and parties interested in the underwriting of the new stocks, and will remain outstanding.

Mr. Burns, in his letter, further points out that "The agreement of merger requires the National Coal Corporation to provide the funds necessary to pay off the present prior preference and preferred stocks of Burns Brothers and it is contemplated that to accomplish this the National Coal Corporation will issue for cash shares of its common stock substantially equivalent in amount to the aggregate shares to be issued in exchange for the outstanding Class A and Class B stock of this company. There will be submitted to the meeting detailed information relative to financial arrangements and relative rights which may be offered to stockholders to subscribe for the new common stock."

Coal Retailers to Hear Talks by Wadleigh, Cushing, Bryden and Parker

F. R. Wadleigh, Federal Fuel Administrator; George H. Cushing, editor of *Cushing's Survey;* J. C. Bryden, chairman of the Special Committee Bituminous Operators, and E. W. Parker are among those who will address the sixth annual convention of the National Retail Coal Merchants' Association, which will be held at Scranton on June 25, 26 and 27.

At the first session on Monday morning reports from the various officers, including Homer D. Jones, the president, will be read, as well as the report of the Reorganization Committee, of which Wellington Bertolet is chairman. Walker Cottrell, of Richmond, Va., is to be the toastmaster at the luncheon at which John H. Durkin, Mayor of Scranton, is to speak. Mr. Wadleigh and Mr. Cushing are to address the members of the association at the afternoon session on Monday.

The association banquet is to be held that evening, with President Jones presiding.

At Tuesday morning's session various committee reports are to be presented and at the luncheon to follow Mr. Bryden is to make his address. The election of officers at the afternoon session is to be followed by an address by Mr. Parker on "Mining and Preparation of Anthracite."

The anthracite operators will entertain the delegates to the convention at dinner Tuesday evening. Wednesday will be devoted to an inspection of the mines.

"Mining Superincumbent Beds," a Topic At Anthracite Section, A.I.M.E.

Called together to give and hear evidence on the effect which the extraction of a lower bed will have on one above it, the Anthracite Section of the American Institute of Mining and Metallurgical Engineers met at the Westmoreland Club, Wilkes-Barre, Pa., Saturday, May 26, the technical discussion being preceded by a dinner at which an election was held for the new officers of the section. E. P. Mathewson, president of the A.I.M.E., and Jack Armour, of *Coal Age*, made the only addresses.

At the close of the banquet Mr. Norris briefly reviewed the paper presented at the February session of the A.I.M.E., by H. R. Eavenson as to certain experiences in the mining of superincumbent seams in the bituminous regions, and Douglas Bunting gave a record of his observations in the mines of the Morris Run Coal Co., in the Blossburg region, where, by the way, the coal is not anthracite but contains 21 per cent of volatile matter. In those mines the Bloss bed had been almost entirely removed, though the exact percentage of recovery was somewhat in doubt. Roughly 50 ft. above was the Morgan bed, separated by an interval of hard sandstone except for a thin bed of fireclay under the Morgan bed, with a thin bed of cannelly coal under that. The Morgan bed was worked with pairs of gob headings 20 ft. wide and with 50-ft. centers. The rooms were driven 42 ft. wide.

The first extraction figured about 62½ per cent and the second about 25 per cent, but figuring in clay veins, which were not infrequent, the actual percentage of recovery of merchantable coal probably reached 92 per cent. The roof above the Morgan bed, between that bed and the Seymour, consisted of 45 to 75 ft. of solid sandstone. In many places the Morgan bed and the rock below it had sheared so that both had been lowered as much as 15 in. The upper sandstone, being thick and strong, had not partaken in that movement. In consequence an opening of varying depth up to 15 in. was left above the coal in the Morgan seam. Such areas were in places quite large.

The testimony of several engineers showed that vacuities of this kind caused by shear were not uncommon in the anthracite region, and the question arose whether it was desirable to have a roof which would afford such resistance, and thus make such vacuities possible, F. E. Zerbey holding that it was undesirable and Mr. Bunting declaring that it was. Several speakers declared that they were mining coal above seams where the coal had been second-mined and also above seams that had been squeezed shut, as over the scene of the Twin Shaft disaster.

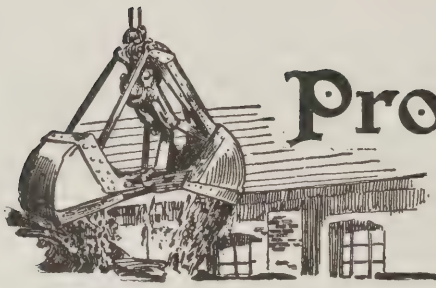
The recovery under these circumstances was quite successful. Caving did not create the disturbance frequently charged to it even when the coal excavated was 30 ft. thick. It should be stated, however, that where the greater thickness was found the coal usually was under heavy pitch. The roof disturbance, however, frequently added to the cost of mining by reason of the introduction of false synclines and anticlines, which complicated the already troublesome coal contours.

Visitors from New York in addition to the aforementioned were Sidney Jennings, former president of the Institute, Dr. F. F. Sharpless, secretary, and R. D. Hall.

Engineers Adopt Program in Storage Study

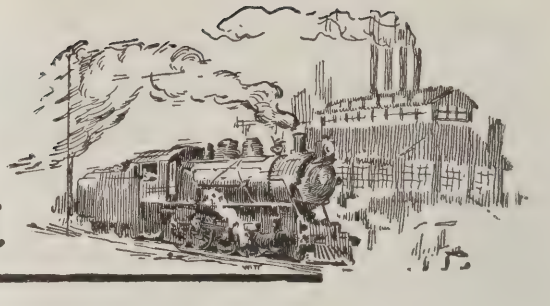
A definite program for the conduct of an intensive study of certain phases of coal storage was laid down at a meeting in Washington on May 25 of the coal-storage committee of the Federated American Engineering Societies. This committee decided to determine to the best of its ability "the engineering, chemical and economic factors" involved in the storage of coal, and the influence of those factors on storage at the mine and by various classes of consumers. The study has been co-ordinated with those being made on the same subject by the President's Coal Commission and by the Federal Fuel Distributor.

Adopt Price Schedule for Settlement of Accounts of Tidewater Coal Exchange



A schedule of prices to be used as a basis for closing out the debit and credit tonnage accounts of the Tidewater Coal Exchange, Inc., now in the hands of receivers, was adopted at a meeting of the debtors and creditors of the exchange and is now being used in settling accounts.

In presenting the proposed schedule of prices the receivers, Charles A. Owen, Howard Adams and James E. Manter, stated that the Chancery Court of Delaware had held that the title to the property involved in the tonnages of the pools of the exchange was and is in the tonnage credit members of each of said pools, and that the Court had directed the debits and credits to be completely settled on the basis of each pool. The receivers stated that it was impracticable to make such settlement because in nearly every pool tonnage debtors were involved who are in the hands of receivers or out of business; therefore it would be necessary for the debtors and creditors to agree among themselves on a method of settlement.



The schedule of prices adopted by the meeting is based on gross tons and covering the period from May 1, 1920, to Sept. 30, 1021, follows:

SCHEDULE OF PRICES PER GROSS TON, F.O.B. MINES

Pool	1	4	9–71	10–12	11–15	14	18	21–34 40–54 64	30–37	31–38	33–39 53–63	43	44	60	61

Production and the Market

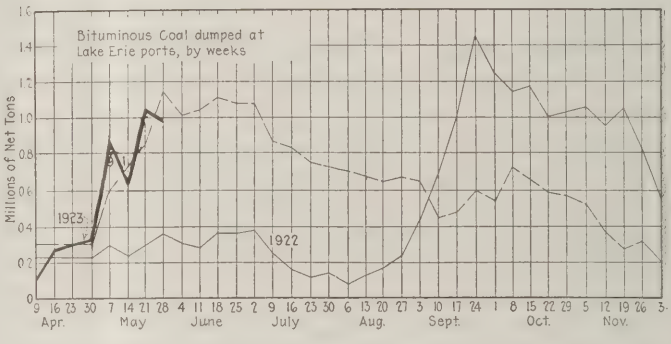
Weekly Review

The country's business is crossing an economic tableland. It is not going downgrade. Well-advised opinion is that the country is fortunate in having relief from the rapid ascent of February and March. The great volume of buying power produced by the unprecedented amounts being distributed in wages is a real element of stability. There is full employment, no stocks and no overproduction. None of the elements of depression is present in the existing situation.

Coal, both hard and soft, is responding to the steady demand with large outputs. Of anthracite there is not sufficient production even at such an unprecedented level for this time of year as over 2,000,000 net tons per week. Prices hold firm and independents are taking premiums over company circulars. Bituminous coal, on the other hand, is capable of such large output that no difficulty is experienced in getting supplies. The better coals are offered in ample amounts to meet the demand of discriminating buyers, and the lower grades are hard to move. Inquiries are plentiful for industry and the railroads are buying. Spot prices are below contract prices and are dropping slowly and steadily.

April Output 9 Per Cent Less Than March

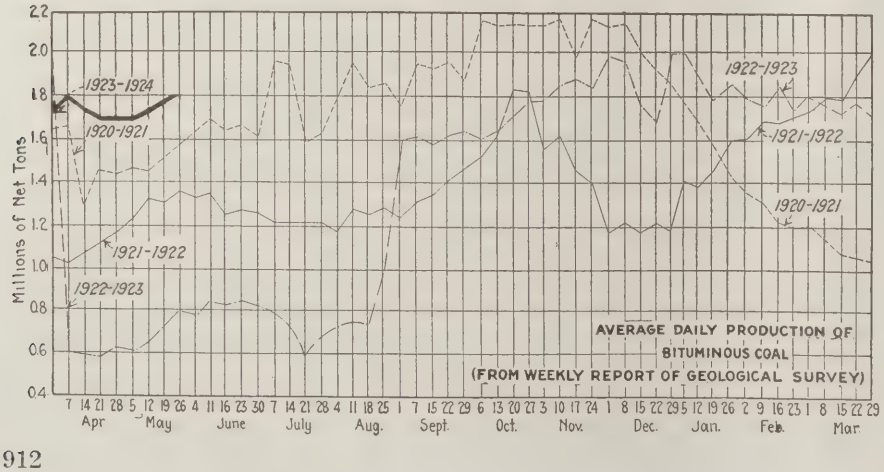
Soft-coal output for the first 119 working days of 1923 was slightly ahead of the corresponding period for the active years of 1917, 1918 and 1920, and nearly one-third ahead of that period of the years of depression, 1919, 1921 and 1922. Output in April was 42,564,000 net tons, a decrease of 9 per cent compared with March.



Stocks of anthracite in the hands of producers on April 30, as reported by the Department of Commerce, were 182,000 tons, compared with 161,000 tons March 31. There were 2,775,000 tons in stock on April 30, 1922.

Declines in prices occurred in the Pocahontas, Clearfield, Cambria, Somerset and western Kentucky districts, with advances in Pittsburgh, Kanawha and eastern Kentucky. *Coal Age* Index of spot prices of bituminous coal registered 217 on May 28, a loss of four points in a week. The average price was $2.63.

Business is dull in the Middle West. Large consumers are picking up distress coals but have not yet started to stock. Consumers in New England who last year used Southern coals have placed orders for good-sized tonnages of Pool 9 and 10 grades of Pennsylvania coals because of lower prices on all-rail coal.



The export market is quiet. Baltimore custom returns show that during the first 24 days of May 26 of the 34 steamers leaving that port took 18,801 tons of bunkers and that 236,129 tons of cargo coal was dumped.

More strength is shown in the Lake trade. Dumpings

are increasing. It is estimated there is at least 1,000,000 tons of coal at the Head-of-the-Lakes. Anthracite is going forward in good volume, although Buffalo shipments from the beginning of the season to May 22 inclusive were 238,680 tons less than in the corresponding period in 1921, when they amounted to 687,600 tons.

"Preliminary estimates of production of soft coal during the week ended May 19 indicate an increase to 10,293,000 net tons, a gain of 118,000 over the revised estimate for the week preceding," says the Geological Survey. "Thus for two weeks an upward tendency in production is shown. This tendency is further shown

by early returns on car loadings during the week May 21-26, which forecast an increase of 5 to 8 per cent over last week, or a total of 10,700,000 to 11,000,000 tons."

Hampton Roads dumpings for all accounts were 361,434 net tons during the week ended May 24, as compared with 333,977 tons in the previous week.

Domestic sizes of anthracite continue to be rapidly absorbed, with the trade asking for larger shipments. Companies and independent operators are well sold up, considerable coal going into the Northwest and Canada. With few exceptions retail dealers have not yet started to stock up.

No New Business in Midwest

Dullness prevails throughout the markets of the Middle West just as it has prevailed for a month. There is less distress coal now than for two or three weeks because nobody is trying to push anything. Southern Illinois screenings have firmed up a shade as a result and are uniformly bringing $1.75, with few undercuts. There remain a good many no-bills in parts of the southern Illinois field, however, and domestic coal is still weak at the circular price of $4.10. A good deal of it brings $3.50. Little other coal is moving. Demand is picking up slightly for smokeless and anthracite without price changes in those fuels.

The countrywide stocking program that was expected to save the situation at this season of the year has not developed in the Middle West. Two or three railroads whose finances are firmest are buying steadily, but that is the only relieving sign.

The fields of central Illinois, Mt. Olive, Standard district and in the Du Quoin region are doing little. Two days running time a week is the best that any operating mine can do on open-market business and few of them are operating at all except to make contract deliveries. Du Quoin domestic sizes do well to bring $3.25. Mt. Olive lump hardly attains that height. The Wabash R.R. is storing a little Mt. Olive in piles along its line through that field.

Little Doing in St. Louis

A few apartment-house owners in St. Louis are taking a little Standard 2-in. lump at $2@$2.25 for summer storage. This plus a light demand for anthracite, smokeless and coke is all the business there is. City steam trade is slack and the country takes no steam fuel at all. Tonnage for thresh-

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 217, Week of May 28, 1923. Average spot price for same period $2.63. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

ing this year has dropped to about one-fifth of what might be called normal. Oil and gasoline appear to have beaten coal to this market.

Kentucky Looks Forward a Month

The general demand on western Kentucky mines is slow. Few mines report better than an average of two days a week except a few with contracts. Operators are beginning to see the futility of overloading trackage with unbilled coal, which merely weakens the market. Screenings are weaker in price despite the fact that there isn't much demand for lump or block. However, there is a fair demand for nut sizes for summer stove use. Indications are that screenings may stiffen somewhat when lump demand shows further softness and when steam plants shift to screenings after Lake trade on larger sizes increases the volume of fine coal on the market.

The feeling is that with lump coal selling at $3 and up and screenings at probably around $1.25 a ton, mine-run will meet with little demand.

Northwest Docks Are Getting Business

The price-cutting campaign to regain markets lost to Illinois and Indiana rail shippers is said to be winning business throughout the southern part of Minnesota and in North Dakota. However, the margin of profits for both sides has practically disappeared, and the volume of trade is not heavy because dealers still think the war between the docks and the rail men will bring further advantage to them.

There is a good call from industrial concerns and the iron ranges. These consumers seem to be satisfied with the present levels, and it is to them and to the railroads that much of the shipping is being done. Prices at Duluth remain about the same, the following quotations being for lump, run of pile and screenings: Youghiogheny, $7, $6 and $4.50; Hocking, $6.75, $5.75 and $4.25; splint $7.50, $6.50 and $4.50; Kentucky lump, $8 to $9.50. Pocahontas has dropped off from the $12.50 level to $11, $7.50 and $6.75.

At Milwaukee receipts have been heavy but trade is dull. Unseasonably cold weather keeps up a suggestion of domestic and heating business and a little anthracite is moving off the docks to inland dealers all the time.

West Buys Little Coal

Light buying still prevails throughout the West. Kansas City and Oklahoma sales offices feel a slight call for threshing coal from the southern end of the wheat belt. A very small storage movement is going on, which includes semi-anthracite, the price on which is slated to go up 50c. at once. Other quotations remain unchanged.

In Colorado heavy rains and chilly weather have kept up a small domestic and heating trade, which holds the market fairly steady. Mines average not over three days a week. There have been no circular changes during the week. Clearing of the blockade in Tunnel 50 on the Moffatt road has opened up the outlet from Routt County.

The only thing that keeps Utah business going is raw spring weather. Domestic consumers are doing no storing in spite of the summer reductions. Mines are averaging about two days a week.

Conditions in Ohio Vary

Trade at Columbus continues quiet and draggy. Buying is limited to immediate wants. Renewal of contracts is not active, as many consumers are buying at low prices when distress coal is available. Pocahontas and smokeless grades are the strongest features of the domestic trade, as well as West Virginia splints and Kentucky coals. For the past few days there has been a better tone to the Cincinnati market than for sometime. Steel buyers are again in the market. Better buying for the lake trade resulted in better prices for 2-in. lump, most of it being held $3@$3.50. At Cleveland the demand is fair. Industrial steam consumers are obtaining their requirements in the open market, and retail buying is quiet.

The Pittsburgh gas-coal market shows no material change. Mine-run is not moving to any great extent, while gas slack commands little if any premium over steam slack on account of heavy offerings. A slight improvement is noted in central Pennsylvania in spite of low prices, many orders from New England being reported. During the week ended May 20 there were 16,970 cars loaded, as compared with 16,300 cars the previous week.

Buffalo consumers are buying slowly and at low prices and are not adding to their reserve stocks.

Railroad buying is believed to be responsible for slightly better conditions in southern West Virginia high-volatile fields. Transportation conditions are better in northern and southern West Virginia and mines on the Norfolk & Western are increasing their production. Inquiries from the tidewater market are largely confined to gas coals.

New England Buys Only Quality Coals

While there has been restricted buying the past week on the part of certain manufacturers in New England, the purchases have been almost exclusively of the better grades from central Pennsylvania. A few of the quality coals are sold up now for June, and the next move will be higher quotations both for delivery extended over several months and for July and August. As yet the medium coals have not been affected; car distribution during June will have some bearing on quotations, however, and the trade is much interested to see when the turn will come.

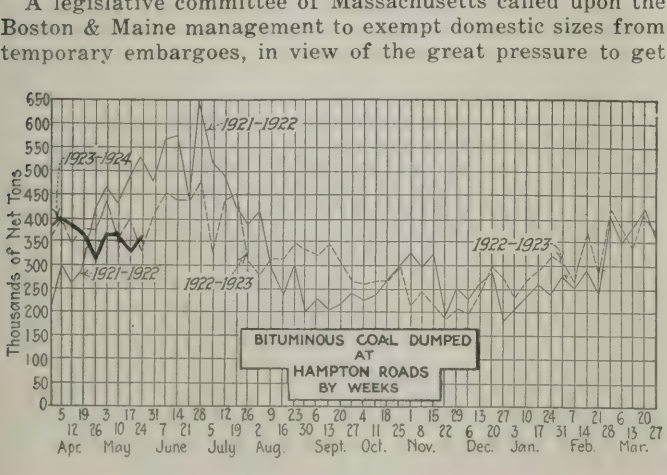
Meanwhile the Hampton Roads coals have eased off

materially in price. Efforts to curtail the volume of coal for the Virginia terminals have not succeeded, and once more there are accumulations and widespread solicitation for spot orders. No. 1 grades are quoted at $6.50, with seconds at $6 @$6.25, and only light inquiry. Export demand is by no means staple, and the $7 level the agencies tried to hold cost them a considerable tonnage which has already begun to move from central Pennsylvania via Philadelphia. For distribution inland there is also very little demand. The $8 price on cars Boston is still high enough to drive business toward the all-rail route among buyers who are not wedded to the Southern coals, and more than likely the rehandlers at this end will soon modify their quotation to correspond with receding figures at Hampton Roads.

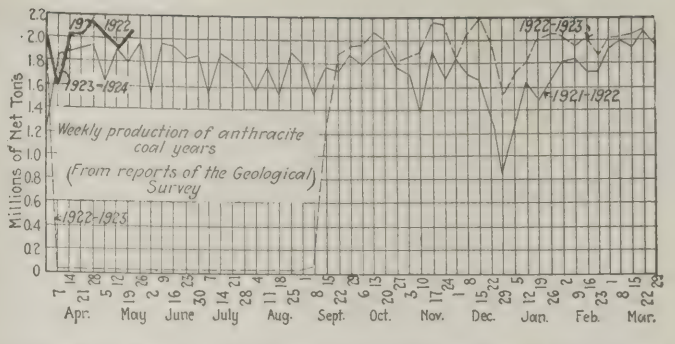
Embargoes that were in effect against destinations on the New Haven and on the Boston & Maine during much of May have now been raised, and receipts at the Hudson River gateways will soon show a material increase. The trade is not much encouraged, however, for it is realized that transportation disabilities are more deep-seated that can be cured by any temporary expedient.

New York Market Notes Improvement

There was an improvement noticed in the New York market. Buyers continue to make inquiries and the better grades of coal were well sold up. At the piers 2,297 cars were reported on May 25, a considerable decrease from the previous week. Some sales of distress coal at low prices were made. There has been no tendency on the part of Philadelphia consumers to stock up, but there are reports that they will start about July 1. The export situation continues to interest the Baltimore market. In Birmingham, Ala., the spot market is quiet. Bunkering was somewhat better, some trans-Atlantic boats taking on coal for the return voyage.



Lake Loading Shows Activity



Loading of boats is going on actively, aided considerably by improved car supply at Cleveland. On May 24 the railroads had 15,624 cars at the lower lake docks and 5,000 cars in transit. In the Pittsburgh market sales in the lake trade were heavier. Some producers in the southern Ohio field have small lake contracts, Lake dumpings for the week ended May 28 were 884,538 net tons of cargo coal and 45,661 net tons of fuel coal, making the dumpings for the season 4,248,601 net tons of cargo coal and 186,010 net tons of fuel coal.

Domestic Anthracite Moving Heavily

Heavy shipments of domestic sizes of anthracite are going into the Northwest, Canada and New England. In the East deliveries are insufficient to enable retail dealers to begin stocking. Stove coal is the hardest of the domestic sizes to be obtained but there has been no let-up in the call for the other coals. Steam sizes are slowly moved. During the week ended May 19 the American Railway Association reports that 3,159 cars of anthracite passed through the principal gateways over the Hudson River into New England.

A legislative committee of Massachusetts called upon the Boston & Maine management to exempt domestic sizes from temporary embargoes, in view of the great pressure to get

supplies forward. Cancellation of the embargo had at that time already been determined upon however.

Movement via the New York and Philadelphia piers continues in reasonably good volume, especially at Port Richmond. Practically all the tonnage of the Philadelphia & Reading Ry. fleet is now in operation, and the quantity of coal dumped will compare favorably with years like 1921 and 1922.

"Production of anthracite in the week ended May 19 increased 7.5 per cent over the production in the week preceding," says the Geological Survey. "The nine principal carriers of anthracite reported loading 39,106 cars, from which it is estimated that the total output, including mine fuel, local sales, and the product of dredges and washeries, was 2,045,000 net tons.

"Preliminary reports of loadings in the first three days of the week May 21-26 indicate a smaller output, principally on account of the low rate of production on Whit Monday."

Coke Output Increases Slightly

Production of coke for the week ended May 19, says the Geological Survey, shows an estimated output of 409,000 net tons, an increase of 8,000 tons when compared with the previous week. An increase of 25,000 tons in the Pennsylvania-Ohio region more than offset small losses in the southern and middle Appalachian states and in Colorado and New Mexico.

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

Foreign Market And Export News

British Output Continues at High Mark; Demand for Welsh Coal Improves

British coal production for the week ended May 12 was 5,603,000 tons, says a cable to *Coal Age*. This compares with 5,325,000 tons the previous week and 5,825,000 tons for the week of April 21 last, the post-war record.

Official figures of the British Board of Trade, says the Bankers Trust Co. of New York, shows that during the first three months of 1923 exports of British coal was 18,694,402 tons, which was almost 1,500,000 greater than in the corresponding period of 1913. In March of this year Germany received 1,836,399 tons of British coal and France 1,805,204 tons.

There is an improvement in the demand for Welsh coal and the operators feel confident they will be kept busy throughout the year. Many buyers are anxious to cover their requirements for the balance of the year. Continental demand is heavier in spite of the unsettled conditions in the Ruhr. Output of Welsh coal is now at the rate of 58,000,000 tons a year, as compared with 56,750,000 tons in 1913, while exports from Wales are above the pre-war level.

The north of England market is strong. German, Russian and Scandinavian buyers are pressing the operators, with French and Belgian demands active, while Italy's demands are easier.

Less Activity at Hampton Roads

Business at Hampton Roads last week showed little activity, and prices weakened with a slowing up in the movement of vessels. Supplies of coal continued to depreciate, due to heavy movements by rail to the West.

Export business held its own so far as movement was concerned, but few new orders being received the bulk of the coal moved to foreign ports having been bought last month for May delivery. The bunker trade showed a slight reduction.

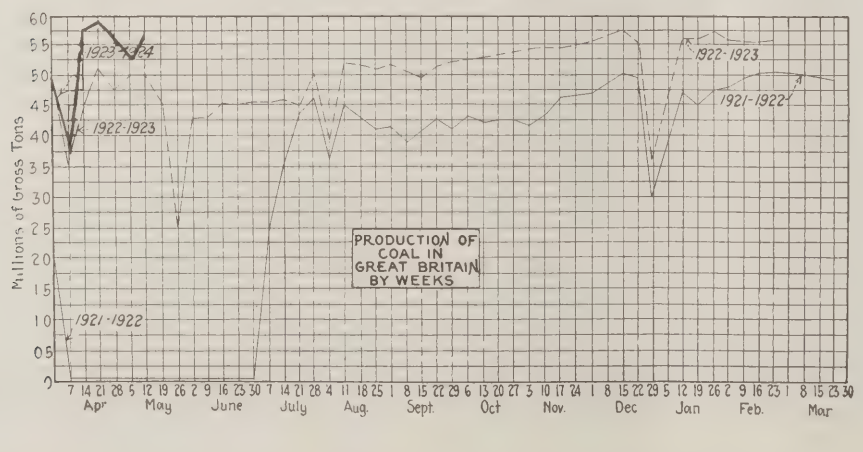
Some heavy coastwise movements were recorded, one cargo being consigned to the West Coast by water. The piers at Hampton Roads operated on an indifferent schedule, but shippers regarded the slight depression as only temporary.

United States April Domestic Coal Exports

(In Gross Tons)

	1922	1923
Coal:		
Anthracite	109,290	421,922
Value	$1,057,378	$4,500,531
Bituminous	714,995	1,384,879
Value	$3,479,041	$8,674,885
Coke	28,413	201,788
Value	$243,417	$2,291,187

	Ten Months Ended April	
	1922	1923
Coal:		
Anthracite	2,891,241	2,869,307
Value	$31,262,142	$31,527,677
Bituminous	12,095,699	11,286,109
Value	$63,101,455	$72,220,483
Coke	246,543	737,788
Value	$2,147,135	$8,148,865



French Fuel Consumption

Fuel consumption of France during March of this year and for the first quarter of 1923, in metric tons, follows:

Coal	March	First Quarter of 1923
Output	3,012,116	8,638,381
Imports	2,022,687	5,671,951
	5,034,803	14,310,332
Exports	301,974	791,489
Consumption of raw coal	4,732,829	13,518,843

The above figures include raw coal subsequently transformed in coke and briquets.

Coke	March	First Quarter of 1923
Production (from collieries ovens only)	149,285	402,961
Imports	126,924	695,166
	276,209	1,098,127
Exports	24,439	88,223
Consumption of coke	251,770	1,009,904
Briquets		
Production (from collieries works only)	262,316	780,160
Imports	41,776	203,404
	304,092	983,564
Exports	25,191	76,220
Consumption of briquets	278,901	907,344

News Items From Field and Trade

ALABAMA

An active statewide **movement is under way to have the state abandon the coal-mine contract labor of its convicts.** It will be made a live issue in the summer session of the Legislature.

Three suits have been filed at Birmingham against the United Mine Workers asking damages aggregating $900,000, the allegations being that the union directed the strike in the Alabama coal fields two years ago and that as a result of it interstate shipments of coal were interfered with and the coal companies lost large contracts. The plaintiffs in the suits, who ask $300,000 each, are the Roden Coal Co., Cahaba Coal Co. and the Blocton Cahaba Coal Co. The trials have been set tentatively for October in the U. S. District Court at Birmingham.

ALASKA

The U. S. Geological Survey announces that **surveys have been made of 16 of the largest mining districts, including all of the important coal fields of Alaska.** The surveys cover a total of 5,000 square miles.

The Secretary of the Interior has authorized the building of a spur 4½ miles long from the Matanuska branch of the Alaska R.R. to what are known as the Moose Creek coal mines in the Matanuska field. These mines contain a good quality of steam coal suitable for export and for use on the government railroad. The estimated cost of the new construction work is $125,000 and the chairman of the Alaskan Engineering Commission estimates that it will save the railroad nearly the entire cost during the first year. Two areas now covered by government coal leases, upon which a large amount of money has been expended in preliminary development work, will be reached by the proposed spur. The cost of the improvement will be contributed in part by the coal-mining lessees.

COLORADO

The Colorado Fuel & Iron Co. hopes to reduce or stop the flow of gas into its Morley mine, in Las Animas County, by tapping a deposit of gas sand near the mine. So a well hole is to be drilled 3,000 ft. into the supposed location of the gas sand. Possibly the drill hole will draw upon the pressure of gas sufficiently to prevent the gas from leaking into the mine through a fissure.

ILLINOIS

Mine No. 2 of the **Chicago-Sandoval Coal Co.,** located at Sandoval, opened May 15 and resumed production. The mine has been closed for a month.

The mine operated by the **Spring Creek Coal Co.,** near Springfield, has been temporarily closed for repairs, as has also **Victoria Collieries Co.** mine at Tamaroa and **Paradise Coal Co.** mine at DuQuoin.

Consumers of electric power in the southern Illinois field deny that the recent strike of Central Illinois Public Service Co. linemen caused them any serious loss or inconvenience. Occasional brief shutdowns is all that any of them report. The strike is now settled.

The Bissell Coal Co. has closed down its mine at Bissell, in the Springfield district. **There are now eighteen large mines** closed in the Springfield district.

The Western Coal & Mining Co. will sink a new mine two miles north of Hurst, in the edge of Williamson County. This company is now operating Mine No. 2, employing 600 men. The new mine will be known as No. 3. It is said that the new mine will be larger than No. 2 and will employ more men. It is proposed to erect 150 houses for the miners near the new shaft.

Following a recent decision by the Illinois Commerce Commission, **the Illinois Central R.R. will begin immediately to construct two and one half miles of track to connect with the Big Four road.** The new branch of the I. C. will begin near the mine of the Dering Coal Co. between Eldorado and Raleigh and will connect with the Big Four tracks near Wasson. This branch is in direct route of large coal mines in the vicinity and will be used largely for coal transportation purposes by the Illinois Central.

The city of West Frankfort, located in the center of the largest and richest coal field in Illinois, with eight large collieries as its principal industries, is fortunate in the fact that practically all of these mines have kept operating steadily and **boasts of a semi-monthly payroll of all the mines of approximately $260,000.** The highest bi-weekly pay since the strike was $360,000, and the average, $300,000.

The coal severance tax bill now before the Illinois Legislature **has been amended** so that it provides a 2c. per ton tax at the mine instead of a tax of 8c. The bill has not been reported out of committee, however.

INDIANA

The Indiana Coke & Gas Co. was sued in the federal court at Indianapolis, Monday, May 16, by the Mississippi Valley Iron Co. of St. Louis, Mo., for $1,750,000. The plaintiff alleges that the coke company delivered an inferior grade of coke, that deliveries were not made according to contract and that deliveries ceased before the expiration of the contract.

The Rader Coal Co. of Indianapolis is to provide the 1924 supply of No. 4 Indiana mine run for the Marion County tuberculosis hospital at Sunnyside, the county infirmary and the Marion County asylum for the incurable insane at $2.40 a ton. This is $1.05 a ton less than the price paid last winter by the county.

The Bloomington Block Coal Co. has been incorporated at Bloomington for the purpose of doing a mining business. The organizers are John S. Risher, Helen T. Risher and Ina R. Irvine.

Suit to obtain judgment of $60,000 for damages was filed May 2 in federal court by the **Worth-Husking Coal Co., of Chicago,** against the **Indiana Power & Water Co. and the Indiana Power Co.** The plaintiff alleges that the defendant company broke a coal contract said to have been entered into on July 17, 1919, by the plaintiff and the **Indiana Power & Water Co.** providing for the shipment to the **Worth-Husking Coal Co. by the Indiana Power & Water Co.** of from 1,400 to 1,800 tons of coal a day from July 21, 1919, to March 15, 1920. The plaintiff alleges that the Indiana Power & Water Co. was taken over by the Indiana Power Co. on Nov. 15, 1919, and that the latter company failed to carry out the contract, shipping in all only 11,300 tons of coal. The original contract is said to have called for the shipment of 50,400 tons.

The Indiana Fuel Supply Co., of Indianapolis, **has filed a preliminary certificate of dissolution.**

H. C. Booth has been appointed receiver for the Black Comet Coal & Mining Co. in a suit filed by Edwin F. Daniels et al. on notes and to foreclose chattel mortgage and for the appointment of a receiver. The Black Comet Coal Co. owns electrical and other equipment in mines formerly operated by them, now leased by the Burr Oak Coal Co.

Because of the laxity in the mining industry in the Bicknell field, **many of the miners' families are reported to be leaving for Detroit and cities in Ohio,** where the automobile and tire business is booming. Recently the American No. 2 mine in the Bicknell field, employing about 450 men, and the Bruceville mine with about 400 men, were closed down indefinitely. Both Pan-Handle mines, which employ about 350 men, have been closed, and Freeman mine No. 2 was closed some time ago. Other mines in the Bicknell field have been working only about two days each week with the exception of Edwardsport, which has had good working time continuously.

IOWA

The Knoxville Mining Co., of Knoxville, will sink a shaft mine, instead of developing a slope mine, as was originally intended.

The Norwood-White Coal Co. has opened a new coal field consisting of about 1,000 acres between Herrold and Grimes. The vein is about 200 ft. below the surface and varies from 4 to 6 ft. in thickness.

Tests which have been made in Cedar and Orange townships, near Albia, show a rich vein of coal at a depth ranging from 150 to 300 ft. Ten test holes have been sunk and it is expected that the tests will be completed by July 1. Edward Coyne, who is directing the tests, has about 3,000 acres of land under lease and has more land under privilege of lease if there is proved to be sufficient coal under the land to warrant leasing. The coal is about of the same quality as that mined by the Shuler Coal Co., near Alpha.

The Davis County Board of Supervisors has **filed suit for $250,000 against the Bloomfield Coal & Mining Co.** for alleged damages to that amount sustained by the county hospital building, near Ankeny, as a result of mining operations.

Production of the mines of Iowa during 1922 was 4,679,683 tons, which included 2,350,582 tons of prepared lump, 1,599,864 tons of mine-run and 729,237 tons of slack. The mines operated but seven months because of a warm winter and the strike. There were 9,218 miners on the average in the Iowa mines, with other underground workers numbering 3,349 and 1,273 surface workers. The third district employed 13,840 of the total number and Polk county 1,883 men.

KANSAS

The Lively Mining Co., capitalization $100,000, has been chartered in Kansas to operate a mine near Pleasanton, in Linn County. Work of sinking the first shaft will begin early in July. The incorporators are W. E. Lively and E. J. Lively, Pittsburg; G. T. Lively, Scammon; Mrs. A. C. Marlatt, Kansas City; and Woodrod Wilson, Denver, Colo.

The Fidelity Coal Co., composed of Joe E. DuBreuil, Oliver Barrett and John W. Cosby, all of Topeka, **has purchased the Jackson-Walker Coal Co.** and will be located at 619 East Eighth Avenue. Mr. DuBreuil has been manager of the Jackson-Walker Co. for the past two years.

KENTUCKY

The present term of the Perry County Circuit Court at Hazard will be largely taken up with the **trial of Floyd and Monroe Kilburn, charged with shooting to death Frank Horn, superintendent of the Coneva Coal Corporation,** at Chevies last winter. Horn who was a former captain in the army and former sheriff of the county, was killed while endeavoring to break up liquor traffic on company property.

MARYLAND

C. W. Hendley & Co., of Baltimore, which has been in business since 1902, has been incorporated under the title of C. W. Hendley & Co., Inc. The officers of the new corporation are Charles W. Hendley, president; W. Winchester White, vice president and treasurer, and Samuel S. M. DuBois, secretary and general manager.

MINNESOTA

A report has been published that hard coal was struck by well diggers near Crookston, at a depth of 60 ft. Samples are in the hands of the University of Minnesota, but it is a safe guess that they will not reveal any anthracite.

O. P. B. Jacobson, of the state railroad and warehouse commission, will send out a recommendation to the coal trade, **urging early buying** of coal by consumers, to avert any trouble in the fall. It is based upon a wire from Herbert Hoover, Secretary of Commerce, on the subject, which included urging co-operation with the dock concerns in an organized step to secure and store coal for winter use.

MISSOURI

J. W. Alder, cashier of the Bank of Merwin, at Merwin, **has taken leases on 2,600 acres of land** between Merwin and Amoret, on the Kansas City Southern R.R., and several new coal mines will be opened in western Bates county.

The airshaft of the coal mine east of Hamilton caved in recently and it will require at least thirty days to repair the damage. The hole made by the cave-in is about 35 ft. in diameter and extends down to solid rock about 48 ft. below the surface.

The U. S. Bureau of Mines rescue car No. 6 has arrived at Moberly, and will remain there until **June 2, when a mine-rescue dem-**

onstration will take place. Rescue training classes have been instituted at Keota, Higginsville, Bevier and Huntsville. Alex J. Miller and T. R. Williams are in charge of the car. Governor Arthur B. Hyde, of Missouri, will be invited to Moberly when the rescue demonstration is given.

A dividend of 75c. per man per working day has been declared by the Co-operative Block Coal Co. of Macon, a large mine operated on a co-partnership by the miners. This dividend is declared from the profits above operating expenses and goes to each man as a sort of bonus over his $7.50 per day wage. For each day put in by the miner he gets 75c. in excess of his stated earnings.

NEW JERSEY

Dr. Oliver Bowles, mineral technologist of the Bureau of Mines, **has been designated** by Secretary Work to be **superintendent of the new mining experiment station** of the bureau **to be established at Rutgers College,** New Brunswick, N. J. He will assume office July 1.

In a statement made public by former Senator Frelinghuysen Governor Silzer of New Jersey is urged to call a special session of the State Legislature **in order to enact laws which will protect the people of New Jersey against suffering from a coal shortage** during this coming winter. Senator Frelinghuysen attacks the inflated prices of coal and urges that additional remedies against the anthracite combination be enacted into law by Congress.

NEW YORK

The Stephens Fuel Co., of Bronx Borough, New York City, **has taken a group life insurance policy** covering each employee for $1,000 and, in the case of salesmen and managers, for $2,000, with a provision for free nursing service. Following this action by the Stephens Fuel Co. the **Weber, Bunke, Lange Coal Co.** took a similar policy.

Announcement has been made by the Berwind-White Coal Mining Co. of the **withdrawal of its subsidiary, the Bermuda Bunkering Co.,** which has done a bunkering business in Bermuda. The modern coal-handling machinery and floating plant of that company will be operated in the future by William E. Meyer & Co. and John S. Darrell & Co. The recent conclusion of arrangements under which Meyer & Co. and Darrell & Co. will stock Berwind coal exclusively in the future has made it unnecessary to continue local operations. Bunkering by Berwind-White at Bermuda has averaged between 20,000 and 30,000 tons yearly. No figures were given in connection with the sale of the Berwind-White plant to the two British companies, which took it over jointly.

OHIO

The Nelsonville & Murray Coal Co., Nelsonville, has been incorporated with a capital of $50,000 to mine and sell coal. Incorporators are M. P. Ohlinger, Walter Wolf, Gertrude Wolf, H. V. Wolf and Alice Ohlinger.

The Long Hill Coal Co., Nelsonville, has been chartered with a capital of $25,000 to mine and sell coal in the Hocking Valley field. Incorporators are L. J. Eberle, R. S. Oxley, A. H. Schory, A. P. Amann and M. E. Voll.

The Hartz Coal Co., Dover, has been chartered with a capital of $10,000 to mine and deal in coal as well as other minerals. Incorporators are George Hartz, John A. Hartz, Edna Hartz, Edward M. Hartz and Ed. C. Seikel.

PENNSYLVANIA

R. G. Skinner, a graduate of Cornell University and for a number of years connected with the Scranton Electrical Construction Co., has gone with the Scranton Electric Co. as assistant to Charles Dawson, who is the power solicitor and commercial engineer for the Scranton Electric Co.

N. H. Patton, of W. H. Patton & Associates, manufacturers' representatives, will in the near future transfer his residence from Philadelphia to Pittsburgh, where he will have charge of work in that territory.

The Philadelphia & Reading Ry. spends $10,000,000 every year for fuel, according to Charles P. Dampman, head of the fuel conservation movement on the road. Engineers, firemen, yardmasters, car inspectors and other employees directly interested in the fuel problem from all parts of the division attended a meeting held at Reading recently. Mr. Dampman urged the saving of a shovelful of coal wherever possible and quoted statistics to show that a saving would be effected if every fireman on the road would conserve a shovelful of coal daily. John Scheofele, road foreman of engines, also spoke and called the attention of the men to unnecessary black smoke, which is a big factor in fuel conservation.

Frank Wise, power engineer of the power department of the Scranton Electric Co., has transferred his connections to the American Gas & Electric Co. at Wheeling, W. Va., as power solicitor.

Conveyors Corporation of America, Chicago, Illinois, **announce the appointment of the Pittsburgh Machine Products Co.,** Oliver Building, Pittsburgh, **as district representatives.** The Pittsburgh organization will handle sales in western Pennsylvania and the northwestern part of West Virginia.

The Glen Alden Coal Co. has increased the dividend rate on the common stock of the company by declaring a payment of $2 a share on the issue, payable June 20 to stock of record June 1. An initial dividend of $1.50 was paid on Dec. 20, last.

Shipments of coal from the Girard Estate properties in the anthracite district in 1922 were 2,050,257 tons, a decrease of 933,465 tons, or 31 per cent, according to the fifty-third annual report of the Directors of City Trusts, Philadelphia. The decrease was due to the anthracite miners' strike. The estate's proportion of the total shipment of anthracite coal from Pennsylvania in the year was 5 per cent, the highest since 1880; 344,607 tons of coal were reclaimed from culm banks in the year, 10,479 tons less than in 1921. Since 1889, when the reworking of culm banks was first taken up on the Girard Estate, 7,001,319 tons have been reclaimed from this source. During the sixty years of active mining on the Girard Estate there have been marketed from it 85,445,442 tons.

Sam Noble, who was elected check weighman and **Joseph Peteavage,** who was elected check docking boss at a meeting of the No. 9 colliery local, of the Pennsylvania Coal Co. on May 14, **resigned their jobs the next morning.** George Hurry and John Pleasatine, their respective predecessors, made a demand on the local for an increase in pay to $12 a day, it is said. They had been receiving $8 a day from the miners for their work.

Joseph J. Jermyn's interests in the coal mining company of Jermyn & Co., which operates a colliery at Old Forge, **have been sold to** George B. Jermyn, E. B. Jermyn, Walter M. Jermyn, R. G. Jermyn and R. A. Downey. The change becomes effective on July 1, next. Jermyn & Co. acquired title to the mining property at Old Forge about thirty-five years ago. Ownership of the operations has remained in the family down through the years. The production of the colliery is from 1,200 to 1,600 tons of anthracite daily. At the present time the colliery is being operated to its maximum of production, with 800 men on the payroll.

The Commissioners of Schuylkill County have decided not to await the long legal suits against the coal companies that are refusing to pay taxes on the $410,000,000 increased valuation on their lands, but **have decided to use their power at once to enforce collections.** This can be done by selling the personal properties of the companies and lands on which taxes have not been paid. Large tracts of land at Minersville already have been turned into the Commissioners and proceedings will be begun to sell these as well as others which will be reported within another week. The county officials say the coal companies not only are delinquent on a whole year's taxes, but they soon will be penalized for delinquency on a second year. It is believed that before the matter can be brought before Court an adjustment will be reached.

Claiming that all the men awarded back pay under a recent decision of Dr. Charles F. Neill of Washington, umpire of the Anthracite Board of Conciliation, had not been given the money said to be due them, the **1,050 employees of the Lattimer, Milnesville and Hollywood mines of C. P. Hardee Bros. & Co., Hazelton, struck May 23.**

The Anthracite Conciliation Board on May 16, ordered the Hudson Coal Co. to eliminate a time check system, already in force at several Hudson collieries. Under the decision, which was written by Umpire Charles P. Neill, the company must immediately remove a check-in and out system at the East End and Baltimore No. 5 collieries, in Wilkes-Barre, as well as at the Marvine mine, in Scranton. Plans to put the same system of timekeeping at other Hudson operations are automatically stopped by the ruling. The decision is also important because in it the board declares the company has no "right to make any changes without the consent of the other party." Fight against the check-in and out system was waged by District President Brennan since October, 1921, when the company first established the new timekeeping method at the Marvine.

Merger of four coal-producing companies under the name of the Irwin Gas Coal Co. with total assets of $3,000,000 has been announced at Greensburg. The companies absorbed by the Irwin company are the Amend Coal Co., the Salem Gas Coal Co. and the Ninevah Coal Co. The merged company operates six mines with a daily output of 4,000 tons, four being located at Export and one each at Seward and Uniontown, all in the western Pennsylvania field. R. H. Jamison, of Greensburg, is president of the company.

State charters have been issued for the following companies: **Inter-County Anthracite Co.,** Philadelphia, mining and dealing in coal, coke and coal lands; capital stock, $5,000; E. A. Samsel, 4514 Osage ave., Philadelphia, treasurer; W. H. Gotwald, Schwenksville, and W. C. Jenkin, Philadelphia, incorporators. **Briar Hill Coal Co.,** Butler; $100,000; mining, preparing and shipping coal. The incorporators are Harry A. Gould, 106 Zeigler ave., Butler, treasurer; C. H. Gould, Ellwood City and C. F. Becker, Butler. **Chickaree Coal Co.,** Ebensburg; $25,000; mining and preparing coal for the market and dealing in coal lands. The incorporators are Murray J. Shiffer, Ebensburg, treasurer; William C. Shiffer and Clementine Shiffer, Ebensburg.

The Senate Finance Committee apparently is satisfied to allow **the Department of Mines to remain as a separate unit of the state government.** The Pinchot code originally provided that the department should become a bureau of the Department of Labor and Industry. This plan met with opposition and several weeks ago the code was amended so that the department remains as it is. The latest revised copies of the code were ready for the Legislature when it reconvened this week and while there were some minor changes in it, the Department of Mines was untouched.

TENNESSEE

Fire recently at the Cambria Coal Co. mine at Briceville, caused a loss of approximately $70,000. The company will rebuild at once.

Reductions in the retail price of coal have been announced by dealers in Memphis. Practically all dealers are selling Kentucky lump coal, which formerly sold for $8.75 a ton, for $7 per ton, and Kentucky nut coal, which formerly sold for $8.50 a ton, for prices ranging from $6.50 to $6.75 per ton. The reductions were said by several dealers to be a result of cheaper prices announced by the mines. The West Kentucky Coal Co. announced a cash price of $6.75 on Tradewater lump coal and $6.25 on Tradewater egg and nut.

UTAH

The trial of the men charged with the murder of a deputy sheriff in Carbon County during the strike last year is being held in Salt Lake City. It took four and a half days of strenuous examination of the veniremen to get a jury.

VIRGINIA

Directors of the **Virginia Iron, Coal & Coke Co. resumed dividend payments** May 24 on the common stock of the company with the declaration of a dividend of 2 per cent on the issue. The dividend was passed in June, 1922. The regular semi-annual dividend of 2½ per cent on the preferred also was declared, both payable July 2 to stock of record June 16.

WEST VIRGINIA

Organization of **the Everett Coal Co.,** of Clarksburg, was perfected a few days ago by the election of the following officers: Karl G. Davis, president; J. A. Ferrel, vice-president; Dr. E. M. Pearcy, treasurer and Louis A. Carr, secretary. This company, having large holdings in Brooke County near Wellsburg, has completed arrangements for early development of its coal property.

At a sale held under a decree of the Circuit Court of Braxon County **R. R. Biddle and C. L. Thompson, of Philadelphia, purchased the property, equipment and assets of the United Coal Co.** This company has been operating three mines in the vicinity of Gilmer, on the Charleston Division of the Baltimore & Ohio R.R., these mines being known as the Darnall, Kather-

ine and Bracket mines. The purchasers have completed arrangements to operate under the name of the Quaker Coal Co. The same concern owns several hundred acres of coal land in Somerset County, Pa. Ernest G. Smith of Weston has been placed in charge of the mines at Gilmer as superintendent.

Charles R. Martin, of Bingamon, has been **appointed manager of the Fairmont office of the Fairmont-West Virginia Gas Coal Co.,** recently organized by Robert Y. Brown, New York coal broker, to operate a mine recently acquired by Mr. Brown on the Bingamon branch of the Western Maryland. For a period of about nine years Mr. Martin was connected with the Jamison Coal & Coke Co., having been payroll clerk, assistant superintendent, chief clerk of the Fairmont office and for several years superintendent of the Bingamon, Fortney and Josephine mines of the Marion Gas and Wyatt-Bingamon coal companies. Mr. Martin's successor at the mines just named will be S. L. Poole, who has been the mine foreman.

The MacEachen Company, recently organized by Washington people and chartered under the laws of West Virginia with an authorized capital stock of $3,000,000, is given the right under its charter to manufacture mine-loading machines, mining machines and mine cars of all kinds, to own coal lands, operate mines and to erect power plants for the manufacture and sale of electric power. The new enterprise was incorporated by Roderick MacEachen and F. V. Murphy, of Washington, D. C.; Charles Wingerter, of Wheeling; J. W. Davison, of Grant Town, and H. E. Grau, of Fairmont. Mr. Davison is an official of the New England Fuel & Transportation Co. The company will have its principal office in Fairmont, W. Va., and will operate in Marion County.

Organization of the Sterling Black Mining Co. presages further development of coal lands in Boone County. This concern has been incorporated with 1,000 shares of no par vale, the seat of operations to be at or near Altman, in Boone County. Among those interested in the new enterprise are G. W. Coyle, of Columbus, Ohio; Sam Brown, of Pittsburgh, Pa.; T. L. Johnson, Frank Kerns and T. F. Somerville, of Charleston.

It is understood that the **New River and Pocahontas Consolidated Co. is negotiating for the plants and properties of the Ephraim Creek Coal & Coke Co., near Thayer,** which adjoin those of the New River and Pocahontas company.

Since May 1 a large corps of civil engineers representing the Chesapeake & Ohio have been in the vicinity of Ronceverte, W. Va., for the purpose of making a survey of the proposed branch line railroad of the Chesapeake & Ohio to the western Greenbrier coal fields.

T. L. Lewis, who at one time was head of the international organization of the United Mine Workers, but who in recent years has been the secretary of the New River Operators' Association, has resigned to devote his time to his own personal business. Mr. Lewis is now an operator as well as editor and owner of *The Coal Mining Review* and desires to devote his entire time to his mines and to the *Review*. He will, however, continue to act in advisory capacity to the New River association, it is announced. S. C. Higgins, who for several years has been the traffic manager of the association, will succeed Mr. Lewis as secretary of the association and will combine the office of secretary and traffic manager. The office of the secretary will be at Mt. Hope in the future.

The Fort Clark Coal Co. resumed operations at its mine between Lost Creek and Mont Clare in Harrison County on May 15, after an idleness of eight months. This company has just negotiated a fuel contract which will furnish employment to every man usually employed at the mine. This company normally employs about 75 miners.

The Raleigh Coal & Coke Co. is engaged in building a road from the company's offices at Raleigh to an intersection with the county road near the Raleigh Coal & Coke Co. station. A 12-foot road is being constructed under the same specifications as are used for county and state highways. The piece of road to be built will cost approximately $10,000.

The American Coal Co., which operates the Pinnacle, Piedmont and Crane Creek operations in Mercer County, has put into commission buses for the use of miners and their families. The buses operated on schedule will accommodate from eighteen to twenty persons and will be used to take the miners to and from their work. The company, the first to provide buses for employees, will not charge the men any fare. The announced purpose of the company in using buses is to encourage the miners in working more steadily.

The Fairmont & West Virginia Coal Co., organized by Robert Y. Brown and others and with general offices in New York, Pittsburgh, Cleveland and other cities, will open an office in Fairmont, following its purchase of a mine in the Fairmont region. The company a little earlier in the month purchased the Shadybrook mine of the Banner Coal Co. on the branch line of the Western Maryland Ry. Offices are to be secured in the Bethlehem Building. Harry MacAlarney, of Ebensburg, will be the manager of the Fairmont branch of the company. A. L. Black, superintendent. It is planned by the purchasing company to increase the capacity of the plant from seven cars a day to 25 cars a day.

Howard N. Eavenson, formerly with **the United States Coal & Coke Co.,** and now a consulting engineer of Pittsburgh, has in association with other Pittsburgh people organized the Pittsburgh Coal Land and Railroad Co., the headquarters of which are at Pittsburgh. This company is capitalized at $100,000. Associated with Mr. Eavenson in the new enterprise are Newell G. Alford, J. R. Hicks, B. K. Folger, all of Pittsburgh, Pa.

The Atlas Coal & Coke Co. of Chicago, Ill., has been authorized by the secretary of state to hold property and transact business in West Virginia.

The following West Virginia **coal companies have been dissolved** as corporations: Ohio Wheeling Coal Co., Will-Earl Coal Co. and the E. L. Sternberger Coal Co.

I. K. Dye, well known in coal circles in northern West Virginia, has been appointed secretary of the Elkins Chamber of Commerce.

The Fairmont & Cleveland Coal Co. has purchased 125 acres of coal land from the Connellsville & Fairmont Coal Co., on Teverbaugh Creek near Worthington. The tract just acquired is a portion of 1,000 acres originally sold to the Connellsville & Fairmont Coal Co., which is operated by K. K. Kramer and associates of Connellsville, Pa. The coal in the tract acquired is in the Sewickley seam and has not heretofore been developed.

The Pocahontas Fuel Co. will soon open another mine in the Wyoming County field, not far from the Itmann mine in Wyoming County, on the line of the Virginian Ry. In order to afford shipping facilities for the new mine it will be necessary for the Virginian to extend its line. There are about 2,000 acres in the tract which the Pocahontas company will begin to develop. The same company is making extensive improvements at Pocahontas, having begun the erection of a number of dwellings for the use of company officials and the clerical force of the company. The building program undertaken is with a view to relieving the housing shortage at Pocahontas.

The Reese Creek Coal Co. is a new concern ust launched by Milton people, having a capital stock of $50,000 and with headquarters at Milton. Interested as incorporators of the new enterprise are Robert J. Lockey, H. C. Heck, V. L. Hall, Lucia C. Heck and Josye H. Hall, all of Milton.

The Burger Coal & Coke Co. and the **Northern Fuel Co.** have been organized by the same people. Headquarters of both concerns are to be at Wheeling. The first-named company is capitalized at $25,000 and the latter at $100,000. Both concerns will engage in the coal business in the Northern Panhandle of West Virginia. Active in organizing both enterprises were A. E. Bryant, Nell Moran, A. S. Burger and H. L. Arbenz, of Wheeling.

WASHINGTON, D. C.

The order of the District of Columbia Court of Appeals in remanding to the District Supreme Court the case of the McAlester-Edwards Coal Co. **with directions to issue a writ sought by the company to compel the officials of the Chickasaw and Choctaw tribes of Indians to recognize a patent for surface lands in Pittsburgh County Okla., was approved by the U. S. Supreme Court** in a decision rendered May 21. The company operates a coal mine in Pittsburg County. Under an act of Congress of Feb. 8, 1918, surface lands were set aside for patent where mines were operated under legal leases on Indian lands, operating companies being given priority. The McAlester-Edwards company filed for surface rights and $2,291 was accepted as part payment. Officials of the tribe refused to accept $10,360 tendered by the company as the balance of the purchase price fixed by appraisement, contending that the Secretary of the Interior had misinterpreted the act. The company petitioned the District of Columbia Supreme Court for a writ to compel acceptance and issuance of the patent. That court sustained a demurrer, which the Court of Appeals reversed, the latter court being upheld by the U. S. Supreme Court.

WISCONSIN

Joseph W. Simpson has been elected president of **The Milwaukee-Western Fuel Co.,** Milwaukee, effective May 10, 1923.

CANADA

Coal mine officials' examinations, as provided under the coal Mines Regulation Act of British Columbia were scheduled for May 29, 30 and 31, at Merritt, Nanaimo, Cumberland and Fernie.

The installation of coal bunkers on the waterfront of the harbor of the **City of Vancouver is proposed** by a coal mining company of the Province of Alberta, the intention being to make a bid for the mercantile requirements of that growing Pacific Coast port.

F. W. Glover, who has been superintendent of the collieries of the Princeton Coal & Land Co., Nicola-Princeton District, **has been appointed general manager.** It is reported that the coal property has been taken over by English interests, that the measures are to be developed more intensively than heretofore, and that production soon will be materially increased.

Coal-mine operators and the businessmen of the province of Alberta generally are disappointed that a greater reduction in freight rates has not been offered by Sir Henry Thornton, president of the Canadian National Railways, in order to permit the development of the market of Ontario for Alberta coals. It has been agreed that the rate shall be $9 a ton as against the present rate of $12.50 a ton from Edmonton to Toronto.

The Trades and Labor Council of Vancouver Island thinks the time has arrived when organized labor should urge upon the authorities the need for a more stringent enforcement of mine regulations, to still further safeguard the men employed in coal mines in the province. The council at a recent meeting expressed its dissatisfaction with the finding of the commissioner investigating the recent accident in the Canadian Collieries (Dunsmuir) Limited, No. 4 mine, at Cumberland, and blamed the operators for not keeping a sufficient volume of air moving in the mines. It was decided to get in touch with labor organizations on the mainland, with a view to enforcing the Coal Mines Regulation Act upon the operators as well as the men.

The strike at the Blackstone mine, at Foothills, Alta., has been settled by the men agreeing to resume work at $7.50 per day, without any signed contract. The strike began on March 31, when the mine owners refused to renew the agreement with the United Mine Workers. The settlement, it is understood, includes the Foot Hills Collieries.

The new budget announced in the Dominion House of Commons by the Hon. W. S. Fielding, on May 11, **provides for a duty of 0.3c. to 0.6c. per gallon on petroleum** not in its natural state and of a specific gravity heavier than 0.79. Crude petroleum remains on the free list. **This tariff has been imposed at the insistance of the coal miners and coal operators of Vancouver Island,** who have been backed by their local members to the Dominion Parliament and by the Provincial Minister of Mines. The new tariff has been aimed against fuel oil, which has been imported in large quantities to the British Columbia coast cities. Whether the coal interests which have been lobbying for this new tariff will benefit by it to the extent that they anticipate seems problematical. Consumers have become weary of high miners' wages and high prices for coal, and there has been an enormous development of hydro-electric power throughout the province to replace power plants previously driven by steam. So far as the bunkering of oil-burning steamers is concerned, it is likely that the duty will be avoided by bunkering at United States, instead of British Columbia, ports. In the new tariff the free importation of anthracite is to be amended to include lignite.

Traffic News

An important precedent is involved in the case of the Smokeless Fuel Co., Inc., versus the Norfolk & Western Ry., counsel for the carrier declare. "Conditions similar to those which existed in the spring of 1920," says the brief for the carrier, "and which led to the establishment of the Lamberts Point Coal Exchange, may arise again —indeed are believed by some to be in sight already. If so, it might be most expedient to revive the pooling arrangements to relieve those conditions and any rulings now made by the commission necessarily will have great influence upon the renewal of such arrangements."

Announcement was made at Pineville, Ky., on May 4, by Don Price, assistant to O. B. Hollingsworth, division superintendent of the Louisville & Nashville R.R. at Middlesboro, of plans for **immediately starting work on double tracking 40 miles of road from Pineville to Harlan,** which would result in the entire Cumberland Valley division from Corbin to the heart of the coal fields being double tracked, giving the road capacity for handling all the coal that can be loaded at the mines now in operation and for some years to come. Double tracking beyond Harlan is not deemed necessary as the road branches there into the Poor Fork branch going to Benham and Lynch.

The report of the Delaware & Hudson R.R. Co., which has just celebrated its 100th anniversary, shows that during 1922 there were produced by the affiliated corporations of the company, including the product of the washeries, 4,423,864 gross tons of coal, a decrease of 4,698,544 tons, or 52 per cent when compared with 1921, or, according to the report, 11 per cent of the year's total output of the Pennsylvania anthracite mines and washeries. The gross operating revenues of the company for 1922 amounted to $37,823,256, which is $7,953,603 less than in the previous year, due, according to President L. F. Loree, to the national strike of the United Mine Workers, general and miscellaneous reductions in freight rates ordered by the Interstate Commerce Commission and the increased divisions of 15 per cent allowed most of the New England railroads. Notwithstanding decreased rates and divisions, earnings from freight transportation, exclusive of anthracite and bituminous coal, increased $847,362, or approximately 6 per cent. President Loree also states that it cost $2,800,000 to keep the mines in condition during the strike, such as operating the boiler plants, pumping and ventilation. Among the items included in the decrease of $3,219,476 in operating expenses for the year as compared with 1921, Mr. Loree cites the decrease of about $491,000 in the cost of fuel consumed. Revenue from coal transportation during 1922 was $15,276,651.47, as compared with $24,876,088.55 in 1921. The company owns 322,416 shares of stock of the Hudson Coal Co., $50 par value, valued at $16,120,800, and 15,000 shares of the stock of the Northern Coal & Iron Co., par value $100, valued at $1,500,000.

During 1922 there were shipped through the Panama Canal, from the Atlantic to the Pacific, 386,922 tons of coal, as compared with 539,536 tons in 1921, a decrease of 152,614 tons. Of this amount 120,417 tons came from the United States and 217,187 tons from the British Isles. South America received 167,984 tons of the coal, Australia, 51,472 tons, Hawaii, 17294 tons and Canada 6,016 tons. During the same twelve months 43,423 tons of coke passed through the Canal to the Pacific Ocean. The British Isles was the source of 31,117 tons, and the United States furnished 4,578 tons of the total. Of this tonnage 28,164 tons went to South America, 1,228 tons to Australia and 100 tons to Canada. Australia shipped 136 tons of coal to the "east coast of the United States" during the year.

The Missouri-Illinois R.R. has asked for authority to publish rates on coal to stations on the Mississippi River & Bonne Terre Ry., St. Francois County R.R. and the St. Louis-San Francisco Ry. via routes other than the established routes without observing the provisions of the fourth section of the Interstate Commerce Act.

On account of **accumulation an embargo was placed May 11 by the Boston & Maine R.R.** on all carload freight from the New York Central R.R. at Rotterdam Junction and Troy, N. Y., for movement to and via the Boston & Maine, except livestock, perishable and railroad supplies, including company fuel.

Argument before the full Interstate Commerce Commission of the case of the **Chicago Coal Merchants Association vs. the Atchison, Topeka and Santa Fe Ry. will take place in Washington June 12.** The case of the **Winding Gulf Colliery Co. vs. the Chesapeake & Ohio R.R.,** the hearing of which was assigned for July 13 at Charleston, W. Va., before Interstate Commerce Commissioner Examiner T. J. Butler, has been cancelled and **the case reassigned for June 18 at Washington** before Examiner W. H. Wagner.

Freight rates applicable on buckwheat and barley sizes of anthracite **from Hudson Pa., to Pompton Lakes, N. J., have been found unreasonable** in an opinion handed down by the Interstate Commerce Commission. The rates were assailed by the E. I. duPont de Nemours & Co. and were unreasonable, the Commission holds, to the extent that they exceeded $1.80 per gross ton prior to Aug. 26, 1920, and to the extent that they exceeded $2.52 per ton on and after that date. Reparation was awarded.

Questions involved in the case of the **Valley Camp Coal Co. vs. the Baltimore & Ohio R.R.** will be considered at an Interstate Commerce Commission hearing at Cleveland, June 18. Examiner Donnally will preside.

On account of an accumulation the **New York, New Haven & Hartford R.R.,** on May 22, **embargoed** all freight for public delivery on tracks of the Union Freight Railroad at Boston, Mass.

Obituary

Henry Woodland, secretary-treasurer of the Allis-Chalmers Co. of Milwaukee, Wis., died of cerebral hemorrhage May 14 at his home in Milwaukee. He took sick the afternoon before. Prior to his going to Milwaukee in 1901, Mr. Woodland had been with the Gates Iron Works of Chicago. For years he had been well known in the machinery industry.

William Goodridge Evans, aged 36, died of pneumonia at his home in Pittsburgh on May 16. He was assistant to the president of the Harris Pump & Supply Co. Mr. Evans was born in Shenandoah.

Thomas B. Brown, foreman at the Virginia mine of the Lacey Coal Co., Millsboro, received injuries on May 15 from which he died later in the day. Mr. Brown was 65 years old and had been a mine foreman for 30 years. He was in the act of placing the haulage rope over a sheave wheel when injured.

Publications Received

"Modern Byproduct Coking and the Koppers Company's New Combination Oven," a paper by Joseph Becker, read before the meeting of the Eastern States Blast Furnace & Coke Oven Association in Buffalo, Oct. 5, has been printed in booklet form, with illustrations. Mr. Becker is a consulting engineer of the Koppers Co., Pittsburgh, which is publishing the paper.

Map of the bituminous coal region of Pennsylvania showing inspection districts and location of mine-rescue stations, with type of appliances used. Mine Safety Appliances Co., bulletin No. 83.

Natural-Gas Manual for the Home, by R. A. Cattell. Bureau of Mines, Washington, D. C. Technical paper 325; 30 pp.; 6x9 in.; illustrated. Contains information on how efficiency in the production and utilization of fuels may be increased and waste prevented. The manual has been prepared for those who use natural gas in their homes.

Approximately 250 cases, illustrating many phases of the questions involved in the relations of employers and employees, are presented in Bulletin 309, **"Decisions of Courts and Opinions Affecting Labor, 1921,"** recently published by the U. S. Bureau of Labor Statistics.

The printed digest of the proceedings of the **Trunk Line mileage scale hearing,** held in New York, Oct. 23-27, 1922 (including necessary exhibits), is now ready for distribution by the State Law Reporting Co., New York City.

Economic Combustion of Waste Fuels, by David M. Myers. Bureau of Mines, Washington, D. C. Technical paper 279; 51 pp.; 6x9 in.; illustrated.

Annual Report of Director of the Bureau of Foreign and Domestic Commerce for fiscal year ended June 30, 1922. Pp. 144; 6x9 in.

Coming Meetings

Iron and Steel Exposition at Buffalo, N. Y., Sept. 24-28. Association of Iron and Steel Electrical Engineers, Empire Building, Pittsburgh, Pa.

The American Wholesale Coal Association will hold its annual convention June 12 and 13 at the Gibson Hotel, Cincinnati, Ohio. Secretary, G. H. Merryweather, Union Fuel Bldg., Chicago, Ill.

Illinois and Wisconsin Retail Coal Dealers' Association will hold its annual meeting June 12-14 at Delavan, Wisconsin. Secretary, I. L. Runyan, Great Northern Building, Chicago, Ill.

Southwestern Interstate Coal Operators' Association will hold its annual meeting June 12 at Kansas City, Mo. General Commissioner, W. L. A. Johnson, Kansas City, Mo.

New England Coal Dealers' Association will hold its annual meeting at Providence, R. I., June 13-15. Secretary, C. R. Elder, Boston, Mass.

National Retail Coal Merchants' Association will hold its sixth annual convention June 25, 26 and 27 at Scranton, Pa., with headquarters at the Hotel Casey.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine-Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will hold its annual convention June 25-29, at Swampscott, Mass. Secretary F. L. Hutchinson, 29 West 39th St., New York City.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

The Electric Power Club's annual meeting will be held at the Homestead, Hot Springs, Va., June 11-14. Executive secretary, S. N. Clarkson, Cleveland, Ohio.

National Coal Association will hold its sixth annual convention June 19-22 at Atlantic City, N. J. Assistant secretary, C. C. Crowe, Washington, D. C.

Retail Coal Dealers' Association of Texas will hold its eighteenth annual convention at Galveston, June 11 and 12. Secretary, C. R. Goldmann, Dallas.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

The Illinois Mining Institute will hold its summer meeting on board a boat on the Illinois River, cruising between St. Louis, Mo. and La Salle, Ill., June 7-9. Secretary, Martin Bolt, State House, Springfield, Ill.

West Virginia Coal Mining Institute has set June 12 and 13 for its annual meeting, to be held at Hotel Waldo, Clarksburg, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment,** Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

The Engineering Section of the **National Safety Council** will hold its second meeting of the year on June 12 in the Board of Commerce Building, Detroit, Mich., in co-operation with the Detroit Safety Council.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, JUNE 7, 1923 Number 23

The Purchasing Agent on Coal Contracts

FOUR resolutions concerning coal were adopted by the National Association of Purchasing Agents at their recent convention, each of which is designed to promote the relations between the buyer and seller and to tranquillize the coal market. One urges that consumers find the coal that best suits their needs and endeavor to purchase that same coal each year. In other words, establish the proper channels for trade and stay in those channels instead of shopping around for every purchase, playing one shipper against another in the search for minor price concessions. Turned around, the advice is good for the seller, and some coal operators have built a successful business around the policy of satisfying their customers so well that no energy is lost in continually seeking new ones.

Coupled with this is the advice to buy and store coal in the summer months against the winter's requirements, depending on annual contracts rather than spot purchases. Contracts always have been and always will be the backbone of business and were it not for recent experience in the coal trade this advice would seem superfluous. The violent fluctuations in the price of coal in some recent periods have induced a process of guessing the market from day to day rather than attempting a long look ahead. It were well indeed for the purchasing agents to lend a hand in restoring normal conditions.

With respect to the form of contract it was resolved that "The National Association of Purchasing Agents recommend to all mining and wholesale companies that each annual contract written show the percentage such contract bears to the expected output of the mine or mines producing the coal sold and that all contract customers be kept advised of the percentage of expected output contracted."

This proposal must be interpreted not as an endorsement of the form of contract that permits the operator or shipper to shave down deliveries on the basis of car supply but rather as a plea to the shipper to put all his cards on the table and afford the buyer an opportunity to check his performance. Buyers have by no means been altogether willing to accept the modern contract stipulation that when car supply falls off and spot prices mount, the shipper has the right to put a portion of his output on the open market and at the same time force the consumer to enter that same market for tonnage sufficient to make up what the shipper holds back. If, however, that is the contract right of the producer, then the purchasing agent is asking by this resolution the reasonable right of access to the records to check the performance of the seller.

The suggestion of the purchasing agents that after a flat price is named in a contract and provision made that "the average price charged for coal under the life of the contract shall not exceed the contract price" but that monthly variations in price shall be permitted is not particularly helpful, if indeed it has any point. A contract may name a flat price or it may simply represent an agreement as to tonnage with proper provision for setting the price currently. Both forms are in common use, but to attempt to join them can avail nothing, unless it be that the seller thereby calculates to have a top price set but no bottom. It will be noted that nothing is said about the average price not falling below the set amount.

Is Conciliation to Give Way to Direct Action?

FOR some twenty years it has been the agreed-upon procedure to settle disputes between the mine workers and management in the anthracite mines of Pennsylvania by arbitration and conciliation. Matters in controversy have followed up through mine committees to a board composed equally of operators and representatives of the miners. Disagreement there has put the question to an umpire whose decision has been recognized as final. Thus have the essentials of peace been preserved in what prior to 1902 had been a most turbulent industry.

There is soon to be an election in the anthracite region, in which the issue is the continuance of the existing order. Cappellini, long a disturbing factor, is running for the office of district president of the United Mine Workers against the organization candidate, Brennan. His program, his appeal, is the settlement of disputes and grievances by strike rather than the established machinery of arbitration and conciliation. An Italian, the unofficial but acknowledged leader of some 10,000 of his countrymen in the district about Pittston, Cappellini has an established record of successful outlaw strikes. He is admitted to have been behind the persistent outbreaks at the collieries of the Pennsylvania Coal Co. that characterized 1920 and 1921.

Despite the handicaps under which it has worked, the absolute adherance to customs and practices of a decade ago, the Conciliation Board, established by the Roosevelt commission, cannot be judged otherwise than as successful. That it represents a perfect arrangement neither side will contend, but it has functioned as a court of last resort and its decisions or those of its umpire have been quite generally respected. It seems to many that the time has come to extend its powers and functions to embrace matters of equity as well as interpretations of contract, but this would put too great a strain on its simple machinery. Better procedure would be to modify the terms of the contract, to negotiate and agree mutually on changes in working conditions and local wage rates.

An insurgent victory in Brennan's district can mean but one thing—that the already sadly ruffled feathers of the dove of peace will be further plucked. Trouble will perch on the banner of the United Mine Workers and strife and strike will further disrupt the production of anthracite. On June 26 the tri-district convention of the hard-coal miners' union meets to formulate

policy and demands on the operators for the contract that is to replace that expiring Aug. 31. If Cappellini sits with Golden and Kennedy it must be admitted that at best the prospects are for a considerable demand for anthracite substitutes in the East next winter.

There is as yet no reason to suppose that a peaceful settlement and new contract cannot be arrived at without an organized cessation of work; there is no occasion for predicting a strike on Sept. 1, but there is for fearing that trouble will attend the growing power of outright radicalism in the ranks of the hard-coal workers. It is small consolation to note that the Lewis policy of militancy is in a fair way to reap some that it has sown.

Desulphurizing Coke

IRON has an unfortunate way of taking up sulphur, and when it has acquired it the two are not easily separated. Bituminous matter always contains more or less sulphur. Unfortunately most of our American coals have more than we would desire in view of the fact that we have to use them for the manufacture of good commercial iron.

The coals that do not have an excess of sulphur rapidly are becoming exhausted, and we are beginning to realize that it is impossible to wash combined sulphur out of many coals because it has not segregated itself in sufficiently large masses and in some cases is not segregated at all, being part of the resins and humus of the coal.

As some coals that badly need desulphurizing cannot be deprived of their sulphur the question naturally has been raised, Cannot sulphur be taken from the coke? The coking process having modified the sulphur constituents under reducing conditions, air being absent perhaps coke by being heated in the presence of air may have some, at least, of the rest of the sulphur removed. Thus we would duplicate the reasoning of sewage purification, which utilizes the combined efforts of anaërobic and aërobic bacteria.

Unfortunately, as Arthur R. Powell shows in the article published in *Coal Age* last week, little hope exists that oxidation will make a sufficient change in the sulphur content to justify thus processing it. The sulphide of iron turns to iron and free sulphur, but that freedom is only relative. The sulphur is freed from the iron but held physically by the coke and consequently may recombine with the iron in the reducing zone near the mouth of the furnace to form iron sulphide.

In the iron-sponge zone the temperature once more liberates the sulphur, which is absorbed either by the iron or the lime of the charge. Whether iron sulphide or free sulphur enters the furnace makes no difference —the result is the same. The sulphates also are quite likely to be reduced, and hence sulphur, when it is in the form of a sulphate, may be regarded as almost as undesirable as when it appears as a sulphide.

The only form of sulphur that seems free of objection in the furnace is the sulphur in solid solution in the carbon. Even in this form its relative harmlessness does not appear proved. This sulphur in one of the cokes described by Mr. Powell runs 1.90 per cent, the other sulphur totaling only 1.30 per cent. As in three runs the aggregates of these other sulphurs were reduced to 0.87, 0.72 and 0.81, or from 33 to 45 per cent, it would still seem that an improvement worth while has been effected. With the other kind of coke the reduction in the sulphur, excluding solid-solution sulphur, was from 0.47 to 0.43, 0.36 and 0.31, the reduction varying from 10 to 35 per cent, which is a less significant quantity.

The Bureau of Mines is to be commended for its inquiries into the desulphurization of coke. They are being extended so as to embrace the effect of steam on that fuel product. It is to be hoped that in view of the importance of the subject, investigation will go on regardless of results, especially if they are no more discouraging than those in Mr. Powell's article.

"Fiddling While Rome Burns"

THIS time-worn phrase has lost none of its meaning with the passing of the centuries. It needs no amplification and no extended explanation.

It has been reported that the National Coal Association will have its annual convention this year at Atlantic City and that the usual two-day business session will be replaced with a four-day jamboree topped off with a boxing match.

It will hardly be seriously contended that the bituminous-coal operators of this country, who make up the constituency of this organization, are mentally incapable of taking part in a serious discussion of the problems that confront them, nor is there the slightest ground for assuming that the majority of these men are unappreciative of their present situation. True enough, for the moment there are no pressing problems of price, of labor, of distribution. Summer is here and the strain of a winter's coal troubles are past, but the strained relations between the public and the operators, the public and the miners and the operators and the miners have not been relieved. The country is impatiently waiting for the industry and the U. S. Coal Commission to tell it what can be done about high prices and periodic shortages.

This industry, which Lawrence Abbott recently said is the "worst hated" in the land, is on trial. The public's representatives are sitting in Washington seeking facts and hoping for interpretations of these facts that will lead to sane thinking about coal and constructive suggestions for the conduct of the industry. The men of the industry, above all others, are urged to come forward with help. Is a meeting of good fellows in the carnival spirit to be their best answer? Or is it that all that can be said has been told? Some forceful truths about the conduct of the United Mine Workers have been spread on the record but no scalps are yet hanging to the belt of the Special Committee of the Bituminous Coal Operators. It is time to beat the tomtoms and have a carnival when the victory is won. A council of war is more appropriate while the fight is on.

KANSAS, THE STATE OF CARRIE NATION, Sockless Jerry Simpson and the blue-sky law, will try anything at least once. It never hesitates officially to make an effort in any direction. But in the matter of opening its coal mines when there is none to buy the coal, in inducing railroads to reduce rates in summer to make coal more attractive financially, and in convincing consumers they should pile up storage heaps when they are afraid such heaps will burn spontaneously, the ambitious state unfortunately is finding out that some nuts are hard to crack. Thus far Kansas has not been able to do in a week what the rest of the nation has found impossible in a generation. But there is hope for the nation.

Steps in Recovery of Anthracite from Waste Piles

Early Mines Wasted All Coal Smaller Than Chestnut—First Waste-Pile Washers Produced Only Pea Size and Smaller—Crushers Now Break Up Larger Coal and Wash It—Coal Unspoiled by Time

By William Griffith
Consulting Engineer, Scranton, Pa.

THE use of anthracite for domestic purposes originated in the Wyoming coal fields in 1808, after the famous discovery by Judge Fell that with natural draft the coal would burn in a grate. For many years after that time, however, no method or process was known for consuming the fine coal which on a fuel bed filled the openings or draft spaces between the larger lumps and choked the fire, causing it to die out. Therefore in the early years of the anthracite trade only the "run-of-mine" coal larger than what we now call the chestnut size was sold or shipped.

The coal was blasted down in the mine and the sizes larger than chestnut were stripped from the fine coal with rakes and hauled out in mine cars. All the coal of finer size—chestnut and smaller—was left in the mine as waste. The marketable coal was then shipped, large and small lumps together, for a number of years, until the market demanded that the larger lumps be separated for engine and blast-furnace fuel and that the smaller ones be reserved for domestic purposes. Therefore screens were constructed at the mines to separate the run-of-mine coal into more acceptable sizes.

Almost 20 Per Cent of Coal Thrown Away

But the market soon demanded a larger proportion of domestic coal than the screening process produced; therefore about 1852 the Delaware, Lackawanna & Western R.R. Co. began breaking some of the larger coal and preparing it in sizes for domestic use. This company was followed by the Delaware & Hudson Co., and later by all the other operators.

This breaking down of the larger sizes produced a large percentage of small, unsalable coal at every mine (about 15 to 20 per cent) which had to be thrown out as waste at an expense of 5 to 15c. per ton. Thus began the old-time culm piles which though for years objects of great interest to those visiting the coal fields were a great nuisance and loss to the coal operators, who knew of no way to dispose of the good coal in them.

Thus originated also the higher prices asked in the market for domestic sizes of coal over the run-of-mine or smaller sizes, because the building of expensive breakers, filled with machinery, greatly increased the cost of the coal, the more careful preparation of the product involved much labor and the breaking of the coal into domestic sizes occasioned much loss. These additional costs were chargeable directly and entirely to the preparation of coal of domestic size. The waste piles consisted of about 80 to 90 per cent of pure coal of sizes too small to be utilized by any then known method and of from 10 to 20 per cent of slate and bone refuse picked out of the coal by boys as it passed through the breakers.

But as time passed progress was made in the art of burning fine anthracite. Methods and machinery were perfected for burning first the coarser, and later the smaller particles of culm, so that about 1867 we find pea-coal sizes returned separately for the first time in railroad toll reports. In 1887 buckwheat coal became useful.

About this time the accumulations in the culm piles attracted such public attention that the Legislature of Pennsylvania in 1889 passed "An Act to create a commission to investigate the waste of coal mining, with a view to the utilization of such waste, and making an appropriation for the expense thereof." This commission, appointed by Governor Pattison, rendered its report in 1893.*

The commission suggested purposes for which small anthracite was useful, methods of using it, etc., and one of the direct results of the commission's activities and its report was the immediate invention of several important devices for consuming fine anthracite. In 1895 rice coal was shipped for the first time, and in

Note—Headpiece shows a modern culm bank which has been deposited under water. This is clearly shown by the stratification of the material.

*The writer is the only surviving member of this commission.

1896 began the first efforts for conserving the smaller coal from the waste piles.

For a number of years prior to 1896 most of the coal breakers throughout the anthracite region had been equipped for preparing the smaller sizes and had been shipping increasing quantities as rapidly as the growing demand required. Therefore the waste of small sizes gradually ceased. They no longer went to the waste pile, but were burned at the mines or shipped from the breakers directly to market, the same as other sizes, and consequently the composition of the waste from breakers to culm piles gradually changed.

Instead of 80 to 90 per cent of the material consisting of small-sized pure coal, as formerly, the more modern waste piles contained only the coarser waste—slate and bone, lumps in part of slate and in part of coal—and a percentage of pure coal which passed to the waste pile on account of the imperfect cleaning processes in the breakers. The percentage of merchantable coal of domestic sizes which went to the waste pile varied with conditions and equipment.

The low prices then universal tended to produce an indifference to waste and a reluctance to expend capital for the reconstruction of plants. For many years the standard method of cleaning domestic sizes was to have boys pick out the impurities as the coal passed them in chutes. The coal sometimes being wet, made it difficult to select the impurities that should be thrown out, and the results were correspondingly wasteful. Gradually machinery has replaced the breaker boy, and the proportion of good fuel sent to the waste dumps has decreased; but the accumulations of good coal of domestic sizes left in the waste dumps amounted to millions of tons.

From the foregoing we note therefore that anthracite waste thus far was of two quite different kinds: First, the old-time culm pile, composed of 80 to 90 per cent of small coal of pure, merchantable quality and 10 to 20 per cent of slate and impurities. At the present day most of the rich waste piles of the earlier days have been worked over and the coal largely conserved and shipped to market. The old-time rich culm pile no longer exists.

Second, the more recent waste pile, which can still be found throughout the region. It consists of the slate and bone, and of good coal some of which is inevitably wasted owing to the imperfection of our processes of separating impurities from the coal. Added to these also is the secondary waste from washing the old-time culm pile, consisting of all sizes above pea coal contained in the original pile, plus the fine dust or silt residue of the washing process.

Early Conservation—The first efforts to conserve commercial coal from the old-time piles began about 1896 and later, and were made by individuals in search of economical processes. These experiments at first were disappointing and costly, but gradually ripened into an economical standard process which was universally adopted. Small screening and washing plants were erected costing from $5,000 to $20,000 each, depending on the quantity of material and capacity of the plant. In these the contents of the pile were screened with the aid of water, no attempt being made to break down the larger lumps or to screen for coal of domestic size, all of which latter was thrown out as part of the secondary waste. Only the pea coal and the smaller steam sizes were saved.

As the old culm piles were gradually worked over and disappeared from the landscape, there still remained the refuse from the breakers and the secondary waste from the culm-pile washeries, many of which were known to be rich in domestic sizes of pure coal, and all of which, if it could be cleaned and separated from the slatey refuse, would provide much excellent and valuable fuel for both steam and domestic purposes, for be it known that anthracite coal in piles does not slake or deteriorate perceptibly with age, as do some grades of soft coal. In proof of and to emphasize the latter fact I give in Table I an analysis of a sample of pure coal which I recently took from an old waste pile deposited about 1855, and therefore exposed to weath-

WASHERY AT WINTON, PA., OWNED BY THE RHONDDA COAL CO., OF SCRANTON

This is a typical washery of the better class. It began operations in December, 1917, and has shipped 466,000 tons of coal to market to date. A culm bank is a pile of good coal, bone and rock. The coal is as good as when mined, but it cannot be separated without the necessary equipment. Yet some of the fly-by-night companies have delivered culm to market imperfectly cleaned and even entirely uncleaned. The size of this breaker will show why; they seek to enter the market without meeting the necessary expense of erecting and operating such a building, which with the machinery it contains is a costly investment.

ering for 65 or 70 years, and an analysis of a sample of a fresh-mined pure coal of the present day, both made by McCreath & Son, of Harrisburg, Pa.

TABLE I—ANALYSIS OF CLEAN WASTE-PILE COAL AND CLEAN FRESH-MINED COAL

	Coal Mined in 1855	Fresh-Mined Coal
Moisture	4.640	3.040
Volatile matter	8.677	6.360
Fixed carbon	81.820	84.066
Ash	4.863	6.534
	100.000	100.000
Sulphur	0.645	0.772
British thermal units, approximate	13,902	13,637

These analyses prove conclusively that at this particular point the old long-stored coal is still the better fuel.

In 1915 the increasing scarcity and advancing prices of anthracite, coupled with improved machinery and cleaning processes, stimulated experimental efforts to recover valuable coal from some of these slate and refuse piles, and, as in the case of the old-time culm pile, these later experiments, though costly, eventually resulted in the evolution of the modern washery plant for winning good, merchantable coal of both domestic and steam sizes from the modern slate piles and the secondary refuse.

The Modern Washery—The modern coal washery in order properly to prepare coal for domestic and steam purposes must be equipped to handle rapidly and dispose of daily large quantities of slate, rock coal, etc., separating from it the merchantable coal and shipping it prepared to conform with a standard at prices acceptable to its customers. This can be satisfactorily accomplished only through the use of much costly machinery, largely of recent invention, and of greater efficiency than the old-time screening and hand-picking methods.

Roughing plants at the pile separate the coarse refuse and immediately dispose of it, only the richer grade of material going to the washery building, which must be equipped with expensive machinery—rolls for breaking down the large lumps, and modern screens, jigs and other separating devices for the sizing and cleaning of coal for domestic purposes, and vibratory tables and other cleaning machinery for preparing the buckwheat and smaller steam sizes.

Consequently an efficient modern washery is a costly investment. I happen to know the cost of several such plants in the Wyoming-Lackawanna fields. Three of these washeries cost about $120,000 each, and one over $200,000. Elsewhere in the anthracite field there are efficient plants, some of which probably cost much more. All of them have been in operation for several years, producing large quantities of coal—from 300 to 1,000 tons each daily. These washeries are constructed and arranged for separating clean coal from the mass of refuse, and much care is taken to produce as clean a product from these waste piles as that obtained from fresh-mined coal. These first-class plants produce chestnut and pea for domestic use, cleaned to the standard which has been maintained and which consumers for many years have found acceptable.

In order to drive home these facts I give in Table II analyses by McCreath & Son of samples I took during May, 1923, one being a sample of washery pea coal from one of the first-class washeries in the Lackawanna valley and one, an average sample of pea coal prepared from coal just mined.

TABLE II—PEA COAL FROM A WASHERY AND ONE FRESH FROM THE MINES

	Washery Pea Coal	Pea Coal Fresh from Mine
Moisture	3.660	2.930
Volatile matter	8.526	7.552
Fixed carbon	69.587	72.259
Ash	18.227	17.259
	100.000	100.000
Sulphur	0.681	0.641
British thermal units, approximate	12,116	12,251

Although this washery coal, as the analyses prove, is almost of equal quality with fresh-mined, it naturally does not command quite as high a market price, therefore this coal has been selling during the past winter at an average price 5 or more per cent less than the average published circular price for independent coal.

The conservation of coal from waste piles of anthracite has been for a long time and is now an important industry. Tables I and II show, what is well-known, that anthracite when stored does not deteriorate with age. The coal now taken from these slate piles, though it has lain exposed to the weather from 10 to 30 years, is as good a fuel as it ever was. In the words of another: "The story of the recovery of this coal is one of the most striking examples of the conservation of

Slate Bank and Slush Pond

This is at the Marvine colliery of the Hudson Coal Co. About 100,000 tons of refuse is removed in a single year's operation. The modern waste pile is lean indeed compared with the rich piles of earlier years which contained coal thrown away to save the cleaning that the blow of a sledge or a pick would have effected, and coal rejected because smaller than chestnut and in some instances coal of chestnut size also.

natural resources and of the elimination of waste in the great industries that the history of our country records." If it were not for the lower-priced washery product of the past few years it is probable that the people would pay even higher prices for fresh-mined coal than have already obtained.

In conclusion, I wish to admit frankly that in the coal industry, as in all other industries of the country, there are unscrupulous persons. Some of the small, independent so-called washery operators have been shipping absolutely "rotten stuff" whenever the coal trade was in such straits that an inferior product could be sold. To prepare anthracite properly for the market is costly. When people without efficient and expensive equipment attempt to ship coal from waste piles they of necessity must ship dirty coal or refuse. It is recorded that Mr. Haldeman, investigator for the fuel distributors, found a number of shippers active in the production and sale of unburnable coal, among whom were "a former prize fighter, a former saloon keeper, an ex-convict, and others of questionable repute." In one instance it is reported that no attempt was made to separate coal and impurities. The "run-of-the-bank" was crushed and sized, run into bins, and then shipped to market. I cannot understand why legal action has not been taken ere this against individuals thus manifestly conducting a fraudulent business.

An attempt has been made recently through sensational and intentionally misleading propaganda to cast the onus for this illicit business upon the legitimate coal-washery operations. The reputable operator refuses to accept this undeserved odium. He is engaged in a legitimate business requiring a large investment of capital, is producing a uniformly good product of standard grade. This is sold by honest methods, at prices satisfactory to customers of long standing, who may with only casual inspection easily distinguish this standard coal from the meretricious trash already mentioned.

Big Losses in Improper Fan Operation*

By J. R. Robinson
Consulting Engineer, Pittsburgh, Pa.

MINE fans are of two types: the disk or screw-propeller type and the centrifugal. The disk fan is essentially a wheel with blades instead of spokes, each blade being curved like those on the screw propeller of a steamship. It is mounted on a shaft and set within a circular casing which is made just large enough that the wheel can rotate without interference.

The disk fan usually is erected in a drift mouth and in such a position that the axis of the wheel is in line with the airway. It is so bratticed about the casing that no air can pass without going through the wheel. Thus when the fan is set in motion the atmospheric pressure is on the outside of the brattice and the maximum mine pressure is on the inside.

The air is assumed to pass through the disk fan in a straight line parallel to the axis of rotation of the wheel, but in practice a large part of the air passing through the wheel is thrown outward at varying angles against the casing and against the sides, roof and floor of the mine. Where the pressure is high a large part of the air returns again and again through the wheel near its center.

Certain parts of this air travel in an elliptical curve and consequently do not enter the mine. Therefore they perform no useful work. Owing largely to this feature of the disk fan it does not economize the power it uses and therefore should not be employed where large quantities of air and high pressure are required.

This type of fan is used mostly for development work and in mines covering a restricted acreage which require only a small quantity of air at a low water gage. Sometimes it is used on larger mines where conditions permit it to be effective as a ventilator, but, though it may give good service, it is not economical in the use of power.

The Shoemaker Coal Co.'s mine at Lilly, Pa., is ventilated by an 8-ft. disk fan, chain-driven from a 60-hp. two-speed motor. At my visit to this mine last March the fan was passing 76,450 cu.ft. of air per minute at a 2.5-in. water gage. This is an unusual performance for a disk fan. The power in the air using the well-known formula was

$$\frac{76{,}450 \times 2.5 \times 2.5}{33{,}000} = 30.11 \text{ hp.}$$

The power passing through the motor as read by the wattmeter was 83.4 hp. The unit efficiency therefore would be

$$\frac{30.11}{83.4} = 36.1 \text{ per cent}$$

which is exceptional for a disk fan, considering that it is working against a 2.5-in. water gage.

In general the observations I have taken on disk fans have shown unit efficiencies of less than 20 per cent—in some cases as low as 5 per cent—so that the work of this disk fan is unusually good, but a good centrifugal fan made to suit the conditions of this mine would not use more than 45 hp., so that by using a disk fan much power is being wasted.

Centrifugal Fan for Volume and Pressure

The centrifugal fan has many shapes, varying from the old-fashioned paddle wheel of the Guibal fan to the most modern multivane wheel, but all of them work on the same principle—centrifugal action. In this type of fan the air is taken into the center of the wheel parallel to the axis of rotation and passes through a spiral curve leaving the wheel at the tips of the blades at a right angle to the axis of rotation. This action of the air is due to the rotation of the wheel on its axis and the form of the vanes or blades of the fan wheel.

The fans most generally in use are of this type, because when thus constructed they have a capacity for producing high pressure and are economical in the use of power. If properly designed to meet the conditions of quantity and pressure, the centrifugal fan can be made to provide any desired quantity of air at the pressure or water gage that the mine may require, and will do the work with a mechanical efficiency of upward of 70 per cent. That is, it will do so if the fan is designed to meet the known conditions of a given mine.

It does not follow that a fan made to suit certain known conditions, which meets these conditions successfully, and works with 70 per cent mechanical efficiency or over, will work with an equal efficiency when the conditions are changed.

As an illustration of this I will cite a mine that came under my observation recently. This mine was being ventilated by a multivane fan of a standard make. The maker guaranteed 75 per cent efficiency for the fan

*Address delivered before Coal Mining Institute of Fifteenth Bituminous District of Pennsylvania, May 19, at Barnesboro, Pa.

when working against conditions represented by 80,000 cu.ft. of air per minute at 2-in. water gage. The fan was belt-driven by a 50-hp. direct-current motor.

The fan was passing but a little more than half the quantity mentioned, and yet the motor was slightly overloaded. The officials of the coal company were displeased because they were unable to speed the fan any more with the present motor. Upon investigation I found that the fan was well constructed and well installed. I also found that the quantity of air passing through the mine was 46,000 cu.ft. per minute, that the water gage was only 1.4 in. with the fan at full speed and that the motor was carrying a load of 55 hp.

Now you will observe at a glance that both the quantity of air passing and the water gage were less than expected. You will also note that the mechanical efficiency of the unit was low.

The power in the air =

$$\frac{46{,}000 \times 1.4 \times 5.2}{33{,}000} = 10 \text{ hp.}$$

and the horsepower in the motor is 55. The mechanical efficiency therefore would be

$$\frac{10}{55} = 18 \text{ per cent}$$

This fan gave such poor results that the management expected that I would condemn it. Let us look into these observations and see where the trouble lies. If the fan had been speeded up until it passed 80,000 cu.ft. per minute through this mine the water gage would have risen to considerably more than 2 in., for it changes as the square of the quantity of air passing through the workings. We should therefore have the following equation:

$$80^2 : 46^2 :: x : 1.4, \text{ or } x = 4.23 \text{ in.}$$

You will observe that to pass the required quantity of air the water gage must be made twice that for which the fan was designed. When the fan was running at a speed to make the required water gage the mine was unable to take as much air as the fan was attempting to pass, so that the air was being taken into the wheel, and a large portion of the air was backing out of the inlets.

The motor was performing work on the air that was thrown back through the wheel, but no measurement of it could be taken, as only that portion of the air that passed through the mine could be measured as to quantity and pressure. Hence the unit was wasteful, but it was not the fault of the fan, for the maker of it had designed it for certain conditions, and when it was put to work the conditions against which it had to operate were not those for which it was designed; therefore economy could not be expected.

Surface Ducts Should Be Kept Tight

The leaks that so frequently occur between the fan and the point of measurement within the mine are often overlooked. This makes many fans appear to be wasteful of power when really they are efficient. It is of the utmost importance that the connection between the mine and the fan shall be practically free from leakage, for imperfections in sealing pass the air made by the fan from the duct or airshaft to the atmosphere in the case of a blowing fan, and in the reverse direction in the case of an exhaust fan. This occurs at the maximum speed at which the air travels, for the pressure at the leak always is more than the mine pressure. I will give you an illustration of this that recently came under my observation.

A modern multivane fan was installed at a mine to pass 110,000 cu.ft. of air per minute at a 2-in. water gage. It was speeded to run 240 r.p.m. and was belt-driven from a 50-hp. motor. It was a drift mine, and the fan was placed about 60 ft. from the first timbers in the coal. The duct connecting the fan with the mine was of wood. When the fan was running at full speed, only 81,000 cu.ft. of air per minute passed through the mine. The motor was carrying a load of 83 hp. The motor would heat if continually run with a load so much exceeding its rating, and it had to be stopped frequently to cool down.

The duct was then covered with concrete, and as a result measurements in the mine showed a current of 109,000 cu.ft. per minute at 2 in. water gage. The motor was using 46 hp. The power in the air =

$$\frac{109{,}000 \times 2 \times 5.2}{33{,}000} = 34.3 \text{ hp.}$$

and the horsepower in the motor is 46. The mechanical efficiency therefore is

$$\frac{34.3}{46} = 74.57 \text{ per cent,}$$

which is a good figure for a belted unit.

The power saved was the difference between 83 and 46, or 37 hp. This power at 1.5c. per horsepower-hour for a full year—the mine was running full time with its fan at full speed—would be

$$37 \times 0.015 \times 24 \times 365 = \$4{,}761.80$$

Nearly five thousand dollars a year was going to waste in leaks.

British Government Will Hold Contest of Mine Locomotive Manufacturers

ANNOUNCEMENT has been made by the Secretary for Mines of Great Britain that Charles Markham, colliery director, of Ringwood Hall, Chesterfield, has placed at his disposal a sum of £1,000 to be offered as a prize for the best type of electric storage-battery locomotive for use in deep and hot coal mines in place of "pit ponies." The condition to govern the competition are now being drawn up by a panel of judges representing the coal-mining industry, the Institution of Electrical and Mining Engineers and the Mines Department of Great Britain.

The competition will be open to manufacturers of any nationality, but the locomotives selected for trial will be tested in Great Britain. Several types of locomotives of this description are, of course, already being made in Great Britain, but it cannot be said that they are in extensive use in British mines. It would appear, says *The Engineer*, of London, England, to which we are indebted for this information, that the battery is the principal item requiring improvement.

The need for a suitable battery, it would seem, could be satisfactorily met by the manufacturers of storage batteries in America, but it is likely some redesign of American locomotives might be necessary to meet the needs of the lighter cars in use in Great Britain and the correspondingly lighter track. Until the formal announcement has been received, speculation is premature, but it is quite probable that a locomotive to meet English conditions should be designed along slightly different lines from one intended to satisfy the American market.

"Most wage earners," says Roger Babson, "spend all they get." It wouldn't be so bad if they earned all they get.—*American Lumberman.*

How Steam Production Costs Were Reduced in a Hand-Fired Return-Tubular Boiler Plant

Changes Made in Boilers Were Small and Inexpensive—Modifications of Firing Methods Require Slightly Less Work on Part of Firemen—Cost of Operation Greatly Reduced

By A. R. Mumford
Assistant Fuel Engineer, U. S. Bureau of Mines

THAT greater economies and higher efficiencies are possible with a large number of boiler installations needs little argument. The methods for obtaining these results are varied, due to the many different factors involved. There are certain elements about every boiler plant and its operation, however, which when neglected or improperly directed or arranged have a marked affect upon the efficiency of the plant.

Investigation conducted on a hand-fired return-tubular boiler plant showed that before making some simple changes to the furnaces and method of control of the boilers the average cost of fuel to produce 1,000 lb. of steam was $0.5287, while after the changes had been made the cost was $0.3540, or a saving of more than 30 per cent.

The boiler upon which the investigation was made was a rather common type set up in quite the usual way; it was 18 ft. long, 56 in. in diameter, set 27 in. above the grates, 6 ft. deep and 5 ft. wide. The bridge wall rose to within 5 in. of the shell of the boiler. The space behind the bridge wall had been filled in so that the floor of this space was only 20 in. below the shell of the boiler. This form of setting is common and results in smoky and incomplete combustion when bituminous coal is used for fuel.

In the original installation the combustion space was small, and the gases were exposed to the cooling action of the boiler during all of their passage through the setting and, what is perhaps more important, were not subjected to any thorough mixing action. These conditions made it impossible to burn bituminous coal without producing more smoke than was permitted under the local regulations governing the emission of smoke. For this reason, pea-size anthracite was burned during the greater part of the day, and the plant was able to burn bituminous coal only at night, when the demand for steam was somewhat less than during the day and when the smoke could not be seen.

The presence of black smoke in the gases issuing from a stack indicates that the gaseous products formed during the combustion of the coal are not completely burned. In order to burn gases completely it is necessary to mix them with a certain proportion of air while they are so hot that the resulting mixture will be above its ignition temperature. There are limits to the amount of air that can be mixed with a certain amount of any combustible gas to form an inflammable mixture, and increasing or decreasing this amount of air above or below these limits renders the mixture non-inflammable, so that it may be impossible to ignite it. The rate of combustion of the inflammable mixture will vary with the proportions of gas and air, and it is desirable to mix the gases rapidly with air in such proportions that they may burn quickly in the furnace and combustion chamber. Thus the problem to be solved before the use of anthracite could be discontinued and bituminous coal used at all times without violating the regulations governing the emission of smoke, was to burn completely the gases formed during the combustion of bituminous coal before they left the setting.

The principal difficulties presented by the original setting were the small volume of the combustion chamber, which shortened the time allowed for the combustion of the gases, and the absence of any mixing device in the path of the gases which would have caused mixing of the combustible gases and air by changing the direction of flow of the gas stream and by changing its velocity at some point or points in its path. The first obstacle to overcome was the small volume allowed for the combustion of the gases. On account of mechanical difficulties involving excessive cost, it was not feasible to alter the relative position of the grates. The combustion chamber beyond the bridge wall, however, had been built up from a concrete floor with filling and a layer of loosely laid brick, and by removing this filling the distance of the floor from the shell of the boiler was increased from 20 to 30 in. This increase in combustion-chamber volume permitted the gases to move at a slower speed for a given rate of combustion and mixture with air, and therefore allowed them more time to burn completely.

Overcome Second Obstacle to Combustion

The second obstacle to complete combustion was the absence of any mixing device in the path of the gases. This was easily overcome by the installation of two semi-obstructing arches, one over the bridge wall and one in the combustion chamber. The vertical distance between the shell of the boiler and the top of the bridge wall was only 5 in. in the original installation, and this distance had to be increased to 10 in. before an arch could be placed over the bridge wall. This arch over the bridge wall closed off the former opening around the shell of the boiler and reduced the area available for gas passage from 5.6 sq.ft. to 1.7 sq.ft. The arch was extended for 3 ft. from the front edge of the bridge wall in the direction of gas flow, to provide hot firebrick surface for the ignition of any combustible gas-air mixture not previously ignited. The reduction in area caused a temporary increase in velocity, which resulted in a turbulent flow, so that mixing was greatly assisted. The increase in velocity and the mixing action were accomplished at the expense of the available draft, and this is the determining factor that governs the extent to which such obstructions may be employed.

Just beyond the bridge wall the area available for gas passage is 12 sq.ft., an increase of 10.3 sq.ft. over that available above the bridge wall. This increase in area considerably reduces the velocity of the mixture

of gases which have come through the restricted area and so gives them a longer time to burn. The deflection arch in the combustion chamber was of single-span construction, extending from the floor to the boiler, and leaving only a semicircular opening 4.15 sq.ft. in area next to the floor of the combustion chamber. This deflection arch caused the gas stream to turn toward the floor of the combustion chamber and further assisted in mixing by causing a second contraction, increase in velocity, and expansion of the gas stream. These changes in furnace arrangement in connection with the introduction of an improved method of firing permitted the substitution of bituminous coal for anthracite at a reduction of approximately $3 per ton in delivered price.

Observations made upon the furnaces and method of firing before changes were made showed that the operation of the boilers was left entirely to the firemen as long as sufficient steam pressure was maintained. This method resulted in irregular firing and high fuel losses because the firemen added fuel or worked the fires only with a view to maintaining the steam pressure between 100 and 110 lb. The dampers on all the boilers usually were wide open and when the steam pressure showed any indication of too closely approaching the blow-off point the firemen reduced the rate of combustion by closing the ashpit doors, and if the steam pressure continued to rise the rate of combustion was further reduced by opening the fire doors.

Evils of Closing Ashpit Doors

Closing the ashpit doors to reduce the combustion rate is an old and generally recognized inefficient practice, and usually results in detrimental affects such as overheated grate bars, increased clinker formation and increased flue-gas losses. Opening the fire doors to reduce further the rate of combustion not only produces the same evils that result from the closing of the ashpit doors but in addition cools the boiler unequally and puts a local stress on the boiler which, especially with fire-tube boilers, increases the wear and repairs necessary on boiler and brick work.

The evils resulting from the closing of the ashpit doors are caused by the changes in the draft throughout the boiler. When the ashpit doors are open the draft available at the damper of each boiler is used to draw air into the ashpit and through the grates and fuel bed, thereby burning the coal; to move the products of combustion through the boilers and to draw air into the setting through any openings in the fire doors or cracks in the brickwork or boiler casing. This influx of air through cracks in the brick work or boiler casing is objectionable and should be prevented by keeping the brick work and casing airtight. When the ashpit doors are closed the amount of air entering under the grates is greatly decreased, thereby decreasing the rate of combustion and the quantity of the products of combustion flowing through the boiler. Closing the ashpit door also increases the draft throughout the setting and thereby increases the infiltration of cold air into the setting through cracks in the brick work or openings in the furnace doors, and thus cools the products of combustion and increases the flue-gas losses. When the amount of air pressing up through the grates and fuel bed is reduced, the grate bars and the ash resting on them become overheated by conduction of heat from the fuel bed. This overheating melts the ash, forming clinker, and causes the grate bars to burn.

In Fig. 1 the flue-gas losses and excess air are plotted against boiler rating for two methods of boiler control. The solid curves show the variation in gas losses and excess air when the boiler was controlled by the ashpit doors, and the dotted curves show the variation in gas loosses and excess air when the boiler was controlled by the damper. The difference in heat loss due to the presence of carbon monoxide in the flue gases, shown in the bottom set of curves, is not wholly due to the method of control of the boilers but to a combination of the method of control, the furnace modifications and the method of firing. The effect of the increased mixing action is perhaps most important in the reduction of this loss due to carbon monoxide. The trend of both curves is similar, but the solid curve is higher at all ratings and the loss increases far more rapidly as the rating increases under the original conditions than it does under the modified conditions.

The difference in heat loss due to the temperature and composition of the dry flue gases, shown in the middle section of the chart, is due almost entirely to the method of control of the boilers. The curves are similar in only one respect, and that is they tend to become parallel to the baseline as the rating increases. The solid curve, showing the dry-gas loss when the boiler was controlled by the ashpit doors, rises rapidly with a decrease in rating; whereas the dotted curve, showing the dry-gas loss when the boiler was controlled by the damper, is more nearly level and descends as the rating decreases. The probable reason for the separation of the curves at higher ratings is in the improvements made in the method of firing, which was more regular under the improved conditions and consequently reduced the fluctuations in the proportion of air to combustible gas.

The curves showing the variation in the per cent excess of air for the two methods of control are similar to the corresponding curves of dry-gas loss. The solid curve rises rapidly as the rating decreases, whereas the dotted curve descends as the rating decreases.

In general, with ashpit door control practically the same draft at the breeching is available at all rates of combustion, but that part of the available draft utilized for actual combustion decreases with the rate of working the boiler. The excess of draft over that utilized for combustion draws air into the furnace and setting above the grates, thus increasing the excess of air and dry-gas losses as shown. With damper control the available draft is reduced by shutting the damper so that the draft available to the boiler is enough for the desired rate of combustion only, and no excess exists to increase the stack losses.

The Fireman's Criterion of Practicability

Perhaps the best criterion that can be used to judge the practicability of a firing method, from the standpoint of the firemen, is the amount of work he must do to produce a given amount of steam. If a new method requires more actual work on the part of a fireman, it is quite likely that the method will be opposed, but if the fireman can be convinced that the new method requires no more work, and perhaps less work, it will be more readily acceptable.

In order to determine whether a fireman had to perform more actual work per 1,000 lb. of steam produced when he fired according to an improved method than when he fired without any attempt at regularity and without care, a record of the work done by the fireman on a test with anthracite under the original operating

conditions and with bituminous coal both under original operating conditions and improved operating conditions was made. The results showed that the average work in minutes required of a fireman per 1,000 lb. of steam produced with anthracite was 2.69 minutes; with bituminous coal 1.98 minutes under former plant operation, and with bituminous coal 1.94 minutes under the new firing method. To produce steam with anthracite requires more work on the part of the fireman than with bituminous coal, because the anthracite contains more ash and has a lower heating value per pound than bituminous coal. Consequently, the higher ash content of anthracite necessitates more frequent cleaning and, on account of the lower heating value, a larger quantity must be fired to produce 1,000 lb. of steam.

The new method of firing requires approximately the same actual work per 1,000 lb. of steam produced as did the former method with bituminous coal as a fuel. However, the new method also requires supervision until the firemen become accustomed to firing small amounts regularly and to keeping their fires in good condition at all times. This supervision is the price to be paid for more complete combustion without objectionable smoke, and is equivalent to a saving of $0.0685. or 16 per cent, in the cost of fuel per 1,000 lb. of steam.

Leveling of Fire Insures Even Combustion

The time spent on leveling the fires is at least as much as that spent on firing, because this work is essential to efficiency. It is the leveling of a fire which insures even combustion, for in this operation holes in the fire bed are covered and the coke bed is loosened so that combustion takes place more evenly. In one test the fires were barred only after cleaning, when the fuel bed consisted almost entirely of freshly fired green fuel. The observations of the smoke produced showed that barring a fire generally produced objectionable smoke, whereas leveling a fire from the top with a rake did not produce objectionable smoke. Even with a rake, however, smoke can be produced if the fireman is allowed to force the rake too deeply into the fuel bed. A safe method of operation as regards smoke abatement is to use the rake for breaking and leveling the top of the fire without disturbing that portion resting on the grates. The grates themselves should be kept free from ash obstruction by running a flat hook over them at intervals of four hours. This hooking of the fires does not disturb the fuel bed to any great extent but does keep the air passages in the grate bars open.

The improved firing method utilized the alternate system of firing. Thus only one-half of the grate surface is charged with green fuel at any one time and the remaining half is left covered with a bed of freely burning incandescent coke from the preceding firing. In this way the fluctuation in furnace temperature is reduced and a temperature high enough to ignite the mixture of combustible gases and air in the furnace is maintained. The procedure followed was to charge with fuel that portion of the fire reached through one of the firedoors and to break and level the other half as part of the same operation.

In order to determine the performance of the plant both before and after the modifications in the setting and control were introduced, a series of tests at different rates of evaporation per hour mere made. Six tests, three with anthracite and three with bituminous coal, were made under the original conditions. After the conditions had been modified three more tests were run

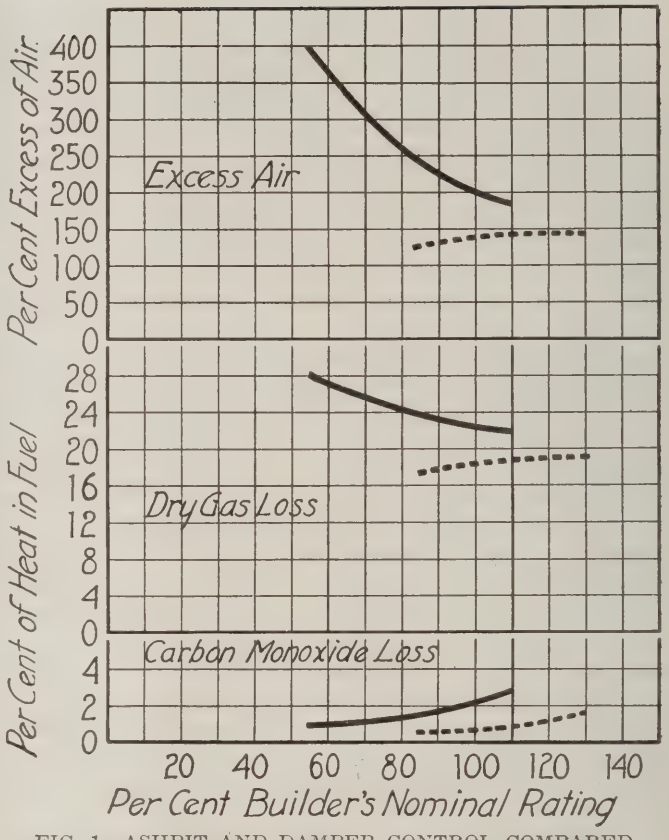

FIG. 1—ASHPIT AND DAMPER CONTROL COMPARED AT DIFFERENT RATINGS

It will be noticed that with the damper method of control the losses are less than with the ashpit method of control for all ratings. Such test curves give conclusive evidence in favor of the damper control.

with bituminous coal, to determine the actual improvement in efficiency.

The principal feature of the results obtained with anthracite are interesting. The efficiency and dry-gas losses decrease as the rating increases, while the loss in the ashpit refuse tends to increase with the rating. The large ashpit losses are due to the high ash content in the original coal which necessitated frequent cleaning of fires. It was found that steam could not be supplied in sufficient quantities if the fires were permitted to burn more than four hours without cleaning, so that the high ashpit loss was part of the cost chargeable to smoke abatement under the original operating conditions. The decrease in dry-gas losses with increase in rating further discredits control of boilers by ashpit doors instead of by dampers, for the decreasing loss indicates that the available draft was more completely utilized for combustion as the rate of burning coal increased.

Under the original operating conditions with bituminous coal the efficiency increased with the increase of rating. This increase in efficiency with increase in rating is accompanied by a reduction in dry-gas losses, and a reduction in the losses unaccounted for. The CO loss increases, as would be expected, as the rate of burning coal increases. The decrease in dry-gas loss with increase in rating is again due to the more efficient utilization of the available draft at higher ratings.

Under the modified operating conditions with bituminous coal the efficiency increases with a decrease in rating. The increase in efficiency is accompanied by a decrease in dry-gas losses and a decrease in loss due to carbon monoxide in the flue gases. The decrease in dry-gas losses with decrease in rating, just the reverse

of the trend of the dry-gas losses under the original conditions, is brought about by the decrease in pressure difference between the inside and the outside of the setting as the damper is closed. This decrease in pressure differences decreases the influx of cold air through leaks in the setting, and consequently results in less dilution and cooling of the products of combustion, and therefore less waste of heat.

The fact that the efficiency increases with a decrease in rating under the modified operating conditions is an especially desirable condition because of the low average rate of working the boilers in the plant under consideration. The average rate of working the boilers was estimated to be 75 per cent of builder's nominal rating. Thus the gain in efficiency due to modifying the conditions was 13.2 per cent over the original conditions with anthracite and approximately 9 per cent over the original conditions with bituminous coal. Thus from each 175 heat units in the anthracite, 100 heat units were given to the steam; and from each 176 heat units in the bituminous coal, 104 heat units were given to the steam before the modifications, and 123 heat units were given to the steam after the modifications.

The cost of coal per 1,000 lb. of steam under the original operating conditions at the average rate of boiler working was $0.7050 with anthracite and $0.4225 with bituminous coal. After modifying the conditions the cost of bituminous coal per 1,000 lb. of steam was $0.3540. These figures were obtained from the costs of coal obtained from the delivery records for the eleven month period from July 1, 1921, to June 1, 1922. During that period 2,653 gross tons of bituminous coal were delivered at a total cost of $19,535.16, or $7.36 per ton, and 1,957 gross tons of pea-size anthracite at a total cost of $20,121.31, or $10.28 per ton. These figures were used because present prices are not stabilized.

The total savings shown possible by the modifications introduced are approximately 900 tons of coal in an eleven-month period and approximately $12,500 in total fuel cost.

Discuss Engineer in Public Affairs

ENGINEERS are more and more coming to feel a greater sense of responsibility as citizens, said Gano Dunn, president of the J. G. White Engineering Corporation, at a meeting of the F.A.E.S. in New York on May 8.

"A discussion of 'The Engineer in Public Affairs,'" said Mr. Dunn, "necessarily turns our attention rather more toward the side of engineering that has received more attention in late years than ever before, the side of the engineer's generalship, the side of the engineer's organizing capacity, the side of the engineer's human contacts.

"There has never been a time when the demand for the education of engineers in the humanities as well as in the sciences and the technologies has been as great as it is today. There never has been a time when the demand for the education of engineers in English, in literature, in the fine arts, has been as great as it is today. The reason is an appreciation, not only on the part of engineers themselves but on the part of those with whom they work, that an engineer must be an all-around man before he can reach the heights of engineering.

"The groping and straining toward a larger part in national affairs that have been concomitant with the development of the national and other engineering societies in the last twenty years has been due to the feeling within engineers themselves that their places as citizens are more and more responsible as every day goes on.

"For my own part I think there has been a waning of opinion in engineering circles that has overemphasized the desirability, if not the appropriateness, of a certain extreme degree of participation of engineers in public affairs. On the other hand, the increasingly essential relation of engineering works and structures, engineering operations, engineering conceptions, and even engineering terms and habits in the daily life of the people of the United States, has been so marked that engineering of itself has been taking a greater and greater part in public affairs, and if the engineer cannot keep pace with his subject, then he certainly is unworthy of the name."

Admiral Robison told of the growing influence of the Navy as a moral factor in the progress of civilization. Engineering science in the Navy was making rapid progress, he said. Citing illustrations of increased efficiency, he continued: "Two years ago we spent considerably more than twice as much money in engineering as we have got today. We spent then about $3.75 per horsepower year for repairs and supplies and maintenance; this year we are spending $1.35 by the development of a method of self-maintenance in the fleet that has got the men on the job to do their own work. We have bought more material and put more material on the ships of the fighting fleet this year with $14,000,000 than we did two years ago with $31,000,000."

Admiral Robison said that the spirit of service is not peculiarly naval and that the engineers in the navy are but "representatives of the noblest profession in the world."

Utilities Consume 3,349,978 Tons of Coal In March; Power Production Declines

Electric public-utility plants consumed 3,349,978 net tons of coal during March, according to a report just issued by the U. S. Geological Survey. This compares with 3,249,927 tons consumed during February, according to corrected returns.

Fuel oil consumed by public-utility plants in March totaled 1,190,495 barrels, compared with 1,161,359 barrels in February.

The average daily production of electricity by public-utility power plants during March was 152,000,000 kw.-hr., or 1.6 per cent less than the average daily output in February. The revised figure for the daily output in February is 154,400,000 kw.-hr., which now stands as the record rate of daily production of electricity by public-utility power plants in the United States.

The slight decrease in rate of production of electricity in March probably was due to the usual seasonal decrease in demand for electricity. It is not expected, however, that the seasonal decrease this year will be at all marked. On account of the pronounced activity in practically all lines of industry at the present time with every indication that this activity will continue, it is believed that the present rate of demand for electricity will continue through the spring and summer and that there will be an increase in demand in the fall months as usual.

The average daily production of electricity for the first three months of 1923 and the proportion produced by water power were as follows: January, 153,300,000 kw.-hr., 34 per cent; February, 154,400,000 kw.-hr., 33.9 per cent; and March, 152,000,000 kw.-hr., 36 per cent.

Iron and Steel Electric Engineers Discuss Applications of Mine Hoists

FACTORS entering into the proper selection of mine hoists, covering a study of the various types of motors used, the method of control and the effects of these factors upon the hoisting cycle and the power bill were treated in a paper presented before the Association of Iron & Steel Electric Engineers at Pittsburgh, Pa., April 27, by F. W. Cramer and A. W. MacDonald, of the Cambria Steel Co., which owns and operates bituminous-coal mines in the Pittsburgh district.

The cost of the hoisting equipment bears heavily upon the selection of the hoist mechanism, gearing, type of motor and control, as these points all affect the first cost, maintenance and expenditure for power.

Complete electrification of a mine has many advantages which materially cut down the power cost of the main shaft hoist because the continuous load permits higher momentary hoist peaks without undue penalty. The main consideration in selecting hoist control from the standpoint of the power bill, however, is to have as low momentary peaks as possible.

The discussion in the paper dealt primarily on a comparison of the straight induction motor with magnetic contactor control, water-rheostat control, and the Ward-Leonard motor-generator system control.

Graphs and curves were used to illustrate the hoisting cycle of the induction motor with water-rheostat control and the hoisting cycle with the Ward-Leonard system. The curves showed how the momentary peaks were appreciably cut down by the latter system, the energy for the peaks being derived from the flywheel of the motor-generator set.

The cost of power, it was asserted, was low with the induction motor where the hoisting was irregular; but the power cost was relatively high for the Ward-Leonard system under these conditions, due to the considerable amount of energy taken up by the motor-generator set when the hoist was not operating. A continued regular operation of the hoist on the Ward-Leonard system greatly reduced the hoisting cost per ton.

Graham Bright, general engineer of the Westinghouse Electric & Manufacturing Co., gave an interesting discussion of the paper. He pointed out that considerable weight should be given to the consideration of the capacity of the power system when selecting the hoist control. Cost of power, when compared with old steam equipment hoists, is not of great importance because some electric hoists are operated at mines where there is required only 2 kw.-hr. per ton mined. Under favorable conditions the flywheel equipment may cut the demand to one-sixth of the value that would be required with the induction motor hoist.

L. C. Mosley, of the General Electric Co., formerly of the Hudson Coal Co., of Scranton, brought out in his discussion the importance of the drum shape upon the hoisting cycle.

The remainder of the meeting was then opened to discussion of the paper and general points of interest.

G. W. Quentin, Duquesne Light Co., spoke on the subject of continuity of service as rendered by the public utilities compared with power made by individual coal companies.

H. Goodwin, of the Sanderson & Porter Co., stated that custom power is most desirable for the coal operator. He also said he believed that in future there would be fewer installations of 25-cycle equipment.

E. J. Gealy, electrical engineer, with *Coal Age*, compared the electrical problems of the bituminous coal field and the anthracite field. He pointed out the advantages of complete electrification over piecemeal changing over to electricity. Continuous loads, he said, would improve the electrical operation by filling in the valleys of the demand.

Early Anthracite Operators Created a Market Only with Difficulty

IN THE early history of anthracite the coal operators' great desire was to push hard coal as an industrial fuel. Today the domestic market during most of the year will take all that is offered. The aggressive work, in promoting the sale of anthracite, of those pioneer days is reflected in some remarks by W. H. Williams, the present vice-president of the Delaware & Hudson Co. He says:

"In 1812 Colonel Shoemaker, of Pottsville, hauled nine wagonloads of anthracite to Philadelphia, and could sell only two, giving away the rest. He narrowly escaped arrest on the charge of attempting to sell for fuel something entirely worthless. The coal cost him as delivered about $28 per ton, but the enterprise was an important step in obtaining recognition of the fuel value of anthracite, principally because a wagonload was sold to White & Hazard, who operated a wire-works at the Falls of the Schuylkill. A whole night was consumed in efforts to make the coal burn and, in final despair, the workmen abandoned the endeavor but chanced to leave the door of the furnace shut. One workman forget his jacket and, returning to recover it, found an excellent fire and the furnace red hot.

"On May 20, 1829, the Board of Managers authorized the president of the D. & H. Co. to have cooking apparatus installed in its banking house,* in order to show that the company's coal could be burned therein. During the next year they investigated the Boston market; sent samples to Providence and even shipped several hogsheads containing anthracite to New Orleans. In 1831 it was arranged to furnish the Ulster Iron Co. with coal for experimentation in steam production and the steamboat 'Experiment' with enough for a trip to Newburgh and return. During the same year coal was supplied for the steamboat 'Victory' and for the use of the Walnut Street ferryboat, and employment was given to Nathan Smith 'to introduce the use of coal in manufactories and all establishments using steam engines,' and to R. Spencer 'for introducing the use of coal to blacksmiths, etc.'

"Efforts to extend the use by boats continued, and in 1836 anthracite was first used for a round trip to Albany. On June 23 of that year the 'Novelty,' with the the managers of the D. & H. Co. and distinguished guests, left her wharf at six in the morning and arrived at Albany twelve hours later, the first steamboat propelled by anthracite to achieve that voyage. In 1848 experiments were made in the use of anthracite for the manufacture of salt at Syracuse and Salina, and as a result of these experiments an expenditure of $10,000 to promote the adoption of this fuel was authorized."

* The D. & H. Co. in its early days was a mine operator, a canal owner and a banker.—EDITOR.

Problems When Selecting Type of Motor Drive for Large Mine Hoisting Plants

Limitations of Induction Motor—Maximum Momentary Peaks Seriously Affect Power Bill—Inertia of Driving Equipment and Hoist Drum Important Factors—Flywheel Motor Generator Set with Two Generators Provides Continuity of Operation

By Graham Bright
General Engineer,
Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

During the past few years there has been a marked tendency to develop mines of very large output. At many of these mines it has been found desirable that the entire output be brought up one shaft. This immediately means high rope speeds or large hoisting loads; in some cases it is necessary to have both high rope speeds and large loads to obtain the desired output. In any event, these factors introduce many important problems, among them being the proper selection of the type of drive, exacting precautions to provide continuity of operation and low cost of upkeep.

Where rapid hoisting cycles are required the power necessary to overcome the inertia of the load and rotating parts represents a large part of the total power required. A steam engine is inherently fitted for this type of hoisting because the inertia of the engine parts is low and the engine can safely be used for retarding the hoist, leaving the brakes for emergency use only. In a large majority of cases, however, steam operation cannot, from a cost standpoint, successfully compete with electric operation. Where electric power is available new installations of steam hoists are becoming more rare each year.

Where power conditions are favorable, the loads small and the hoisting cycles are not too frequent the alternating-current wound-rotor induction motor with magnetic-contactor type of control will prove the most satisfactory.

In regard to the power system there are two factors that influence the selection of the proper type of hoist motor. The first is the capacity of the power system, including transmission lines. There are many central-station systems in this country that will not permit an induction-motor hoist of over 200 hp. to be connected to their lines. Only the larger systems can permit induction motors of over 500 hp. for hoist service to be used on their circuits. In many cases inadequate capacity of transmission lines prevents large induction motors being used for hoists—because of the poor regulation that would result.

A second condition is the form of contract under which power is purchased. Where momentary peaks are penalized it is necessary to make a careful analysis before determining the proper type of hoist motor to be used. This is best accomplished by determining the cost of power under different outputs, as the mine will operate at full capacity only a small percentage of the time. After the cost of power for different outputs has been determined a further analysis will show whether it will pay to install the more expensive direct-current hoisting system.

Where the power conditions are unfavorable it is necessary to go to the direct-current hoist motor using field control and in most cases a flywheel-motor generator set. There are cases, however, that bar the use of the induction motor even with favorable power conditions; these are cases where rapid cycles with high rope speeds are required or the extra safety and superiority of the control of the direct-current system is desired.

Where extremely fast cycles are required the inherent high inertia of the alternating-current motor produces abnormal peak loads and losses during acceleration, and in addition, the braking loads are too large to be absorbed by mechanical brakes. The direct-current motor of the same capacity has a lower inertia than the corresponding alternating-current motor; in extreme cases it is necessary to go to a direct-connected motor, thus resulting in much lower inertia than with the geared motor. The direct-connected alternating-current motor is out of the question in practically all cases because of the poor electrical performance of a slow-speed induction motor.

Fig. 1 illustrates a set of conditions which can be met best with the direct-current geared motor using a flywheel motor generator set. This hoist was originally equipped with a 350-hp. wound-rotor induction motor geared to the hoist drum through double reduction gears. This motor was used during the development

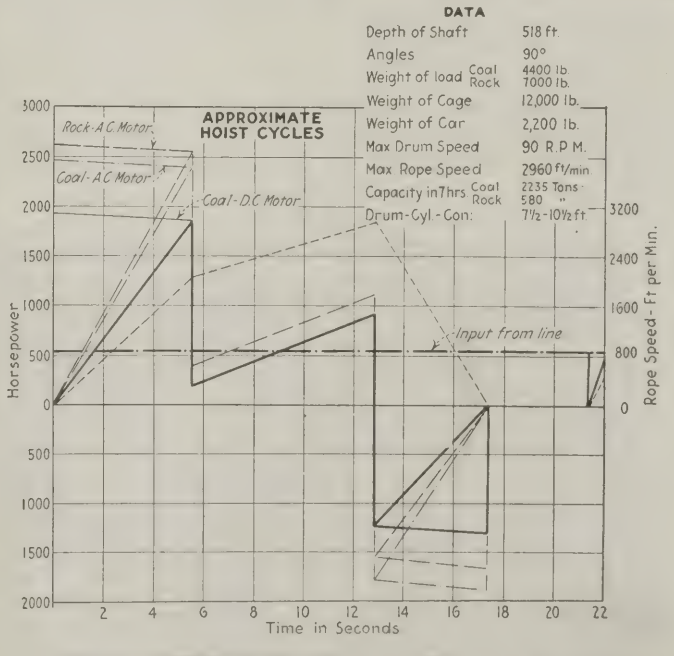

FIG. 1—COMPARISON OF A.-C. AND D.-C. MOTOR HOISTING CYCLES

These curves show the relative values of the peak loads which result when the alternating-current induction motor or the direct-current motor is used. The energy for the high points of the peaks is drawn from the flywheel when the direct-current motor is used on such a hoisting problem.

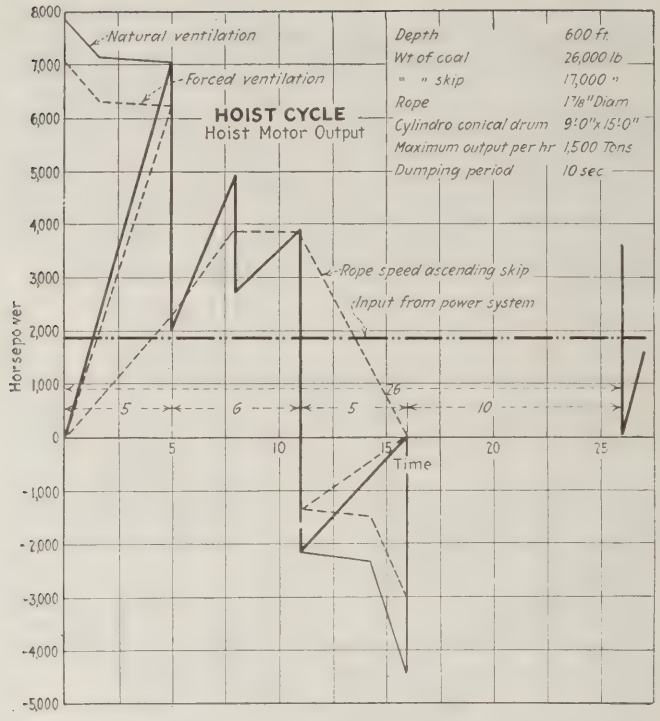

FIG. 2—HOISTING CYCLE WITH FORCED AND NATURAL VENTILATED MOTORS

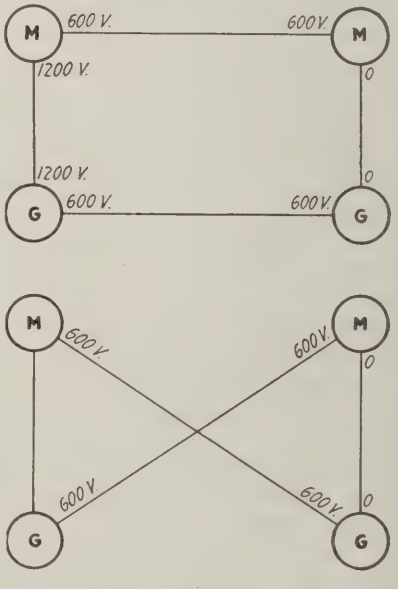
The size of the motor may be greatly reduced when forced ventilation is used. This in turn reduces the peak loads of the hoisting cycle in that the inertia of the smaller motor is appreciably less.

stage and the momentary peak loads produced were between 400 and 500 kw. When it became time to replace the small motor with a larger motor to produce full capacity, as shown on the curve, it was found that there were two good reasons for substituting the direct-current system instead of continuing the alternating-current system. The curves show that with an alternating-current motor of approximately 1,500 hp. capacity the peak loads when handling coal would be about 2,500 hp. and a little higher when handling rock. During the braking period the power required will be over 1,500 hp., which is entirely too great to be absorbed by mechanical brakes.

In estimating the capacity of the hoist motor it was found that due to the extra capacity required while plugging the motor during the braking period the motor would have to have a capacity of at least 1,800 hp., which would overload the 1,500-hp. motor. Upon selecting a larger motor it was found that the increased inertia of the rotor of the larger motor would build up the peak load during acceleration and retardation to such an extent that the increased capacity was more than absorbed by the increased loads. This results in a pyramiding effect, which means that the alternating-current motor is not adapted to this type of cycle unless a special design is developed.

The capacity of the direct-current motor to meet this cycle was 1,350 hp. After this equipment was installed the mine was operated at about one-half capacity with the maximum momentary peak load from the power system of only 175 kw. This resulted in a marked saving in the power, due to the fact that momentary peak loads are penalized in the contract and the other load about the mine plant did not average over 200 kw.



The above value of 175 kw. seems low when compared to the capacity of the hoist motor, but this brings out the advantages of the flywheel motor generator set. The flywheel supplied most of the energy for the half-capacity hoisting cycle in this case. It is important to bear in mind that sufficient time must be allowed between hoists to permit the flywheel to be brought back to speed, where the maximum input from the line is to be held as low as possible.

Where a large output is required from a shaft mine it usually is impracticable and undesirable from an engineering point of view to attempt to obtain the output by hoisting a single car at a time. To overcome this difficulty a number of mines have installed skips ranging in capacity from 6 to 20 tons. Under this system the coal is dumped into skip pockets at the foot of the shaft and the rope speed of the hoist system may be greatly reduced and larger quantities of coal brought up at each trip.

Fig. 2 illustrates a rather exceptional condition but shows the trend of high-speed and high-capacity hoisting in some of the coal fields where conditions for such capacity are favorable. This cycle requires direct-connected motors using a flywheel motor generator set. For a large system of this type it will be found best to install two hoist motors, one at each end of the shaft. Where such large capacities are involved a forced ventilated motor will show a considerable advantage. The capacity of an electric motor depends upon its ability to get rid of the heat losses without attaining a temperature of over 40-deg. C. rise. The ventilation of the motor when it is running greatly assists in carrying away these heat losses.

When the motor is at rest it is capable of taking care of about one-half of the losses that would be the case when in operation at full speed. For this reason a hoist motor with fairly long rest periods will have to have considerable more capacity with natural ventilation than would be the case with forced ventilation. This is illustrated in the curve shown on Fig. 2, where the total capacity required with natural ventilated motors is 4,400 hp. and with forced ventilated motors 3,400 hp.

The forced ventilated motors can be built with a smaller diamater armature, resulting in less weight and lower inertia, as shown by the power curves during acceleration and retardation. The heavy lines in the figures show the actual power delivered by the motor, while the light lines show the apparent power or torque. The high peaks at the beginning and end of the retarding period are due to the fact that the upper skip has partly overturned and a certain percentage of the weight is taken off the cable. These peaks, however, are torque only and do not represent real power. They have a

FIGS. 3 AND 4—CONNECTIONS WHEN TWO HOIST MOTORS AND TWO GENERATORS ARE USED

The connections of Fig. 3 add the two generator voltages, requiring heavier insulation and increasing the danger. In Fig. 4 the connection is such that the voltages are not additive, thus reducing the liability to breakdown or other dangers.

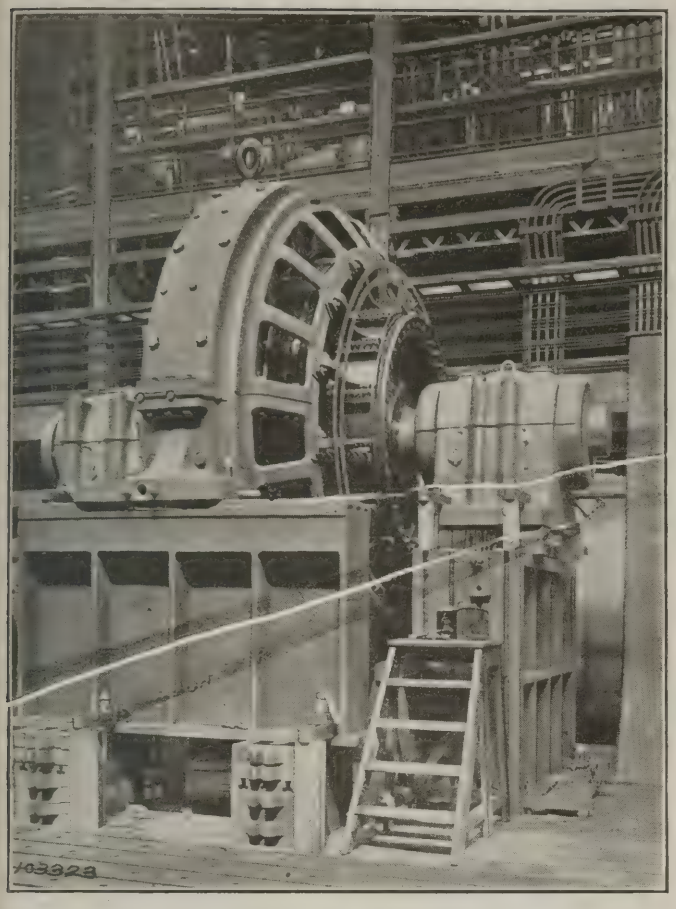


FIG. 5—TYPICAL D.-C. HOIST MOTOR

There is a tendency to think that all large motors are without question operated on alternating current, but when it comes to exceptionally large hoisting problems the direct-current motor again comes into its own.

considerable influence, however, in the heating of the hoist motors and generators, since it requires heavy currents to produce these torques.

It will be noted that the maximum variation in load is approximately from 7,000 hp. at the end of the accelerating period to —2,000 hp. at the beginning of the retarding period; the total variation is 9,000 hp. at the hoist, while the variation in power from the system will not be greater than 5 per cent on either side of the average input of 1,850 hp. The input to the alternating-current motor is kept constant by means of a liquid slip regulator.

The amount of power required during the braking period could not be taken care of satisfactorily by mechanical brakes. This braking is produced by the generators acting as motors and returning this power to the flywheel helping to bring it back to normal speed.

The equipment for such a hoist could be built with one large hoist motor and a motor-generator set consisting of an induction-motor flywheel and one generator. There would be considerable advantage, however, in using two hoist motors, one at each end of the drum shaft, and two generators on the flywheel set. The two hoist motors would have less inertia than a single-hoist motor and would have the advantage that in case of trouble one of the hoist motors could be disconnected and the other used with a reduced capacity of hoisting.

With a single generator on the motor-generator set the speed would have to be restricted to about 350 r.p.m., which would mean a large and expensive generator and induction motor. The flywheel also would have to be much heavier than with a higher speed set. By selecting two generators a much higher speed set can be used, which means a considerable saving in the cost of the generators. Incidentally, the induction motor and the flywheel will weigh considerably less, due to the fact that it can be operated at a much higher peripheral speed. In case of trouble with one of the generators it can be disconnected and the other generator used with a reduced hoisting capacity. The over-all efficiencies of flywheel sets run from 50 to 60 per cent.

For most fast hoist cycles the cylindro-conical drum is used. In general a drum of this type is so designed that the loaded rope travels on the small cylindrical portion of the drum during acceleration while the empty rope travels on the large cylindrical diameter. At the end of the accelerating period the loaded rope starts to climb the conical portion of the drum. This part of the drum generally is made as steep as possible so that the rope reaches the larger diameter in three or four turns. By this means as much as possible of the travel takes place on the large diameter of the drum.

The best size and shape of the drum depends on a great many conditions, one of the most important of which is the inertia of the drum parts. A comparison of the various sizes and shapes of drums will be of little value unless accurate information is available regarding the inertia values.

One of the most important parts of a flywheel hoist equipment is the control. The magnetic type has proved much superior to the hand-operated drum type especially in regard to automatic acceleration, retardation and the application of safety devices. Automatic acceleration and retardation can be obtained in a manner much more satisfactory than any mechanical scheme that restricts the movement of the control lever during acceleration and forces the control lever to the "off" position during retardation.

The scheme of using two motors and two generators with a flywheel motor-generator set system has not been applied in this country to hoisting equipment, though it has had considerable application for reversing rolling-mill equipments. In order to divide the load equally it has been found best to connect the armatures of all machines in series. The ordinary scheme for doing this is illustrated in Fig. 3, which shows the two generators connected in series and the two motors connected in series. This, however, produces a total voltage of 1.200 when 600-volt generators are in use.

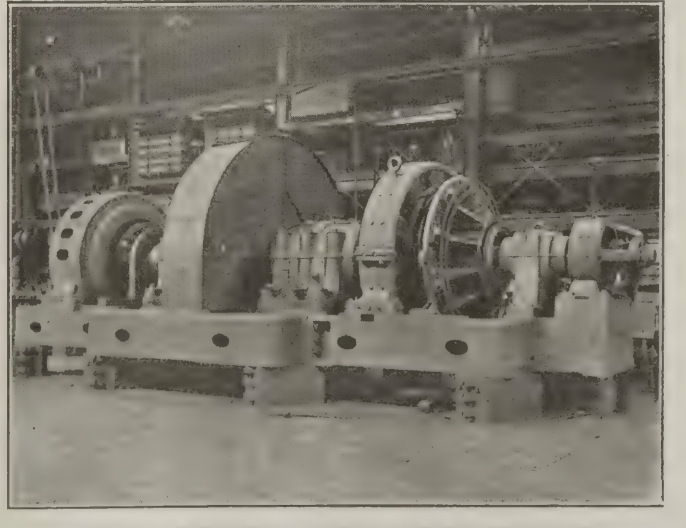

FIG. 6—FLYWHEEL MOTOR-GENERATOR SET

This motor-generator set feeds the direct-current motor in Fig. 5, which is used on heavy shaft duty at Butte, Mont.

Where large machines are involved best engineering practice shows that 600 volts is the most economical for a single generator. With the generators in series, however, it is necessary to insulate the machines for 1,200 volts and there is added a considerable danger to the operators due to such high voltage on commutator types of machines. A much better arrangement of circuits is shown in Fig. 4, where the motors and generators are alternated. This keeps the maximum voltage down to 600 and permits the use of standard and well-tried equipment. The advantage of the arrangement shown in Fig. 4 is so great over that as shown in Fig. 3 that it is doubtful if the safety committee at any mine would permit the installation of the equipment wired up as shown in Fig. 3.

Most of the large electric hoists in this country have been installed in metal mines but it is probable that in the near future the capacity of the equipment of coal-mine hoists will not only approach but probably will exceed the largest capacity installed in the metal mines. Fig. 5 illustrates a 2,000-hp. 72-r.p.m. 600-volt direct-current hoist motor which was installed at the North Butte Mining Co., at Butte, Mont., in 1915. It would require two such motors to meet the cycle illustrated in Fig. 3. Fig. 6 illustrates the flywheel-motor generator set which supplies power for the hoist motor illustrated in Fig. 5. The capacity of the generator is 1,500 kw. and the capacity of the alternating-current induction motor is 1,400 hp. The flywheel weighs 100,000 lb.

Fig. 7 illustrates a liquid slip regulator which keeps the power input to the induction motor at a constant value; this regulator is entirely automatic.

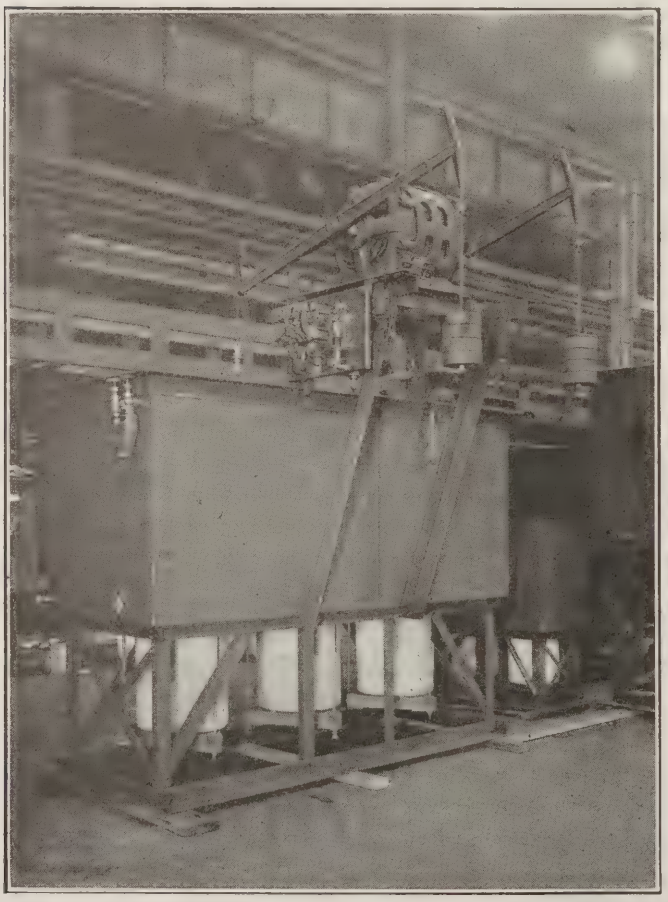

FIG. 7—LIQUID SLIP REGULATOR

The function of the regulator is to automatically control the input to the motor of the motor-generator set. Its operation maintains a constant input from the power system.

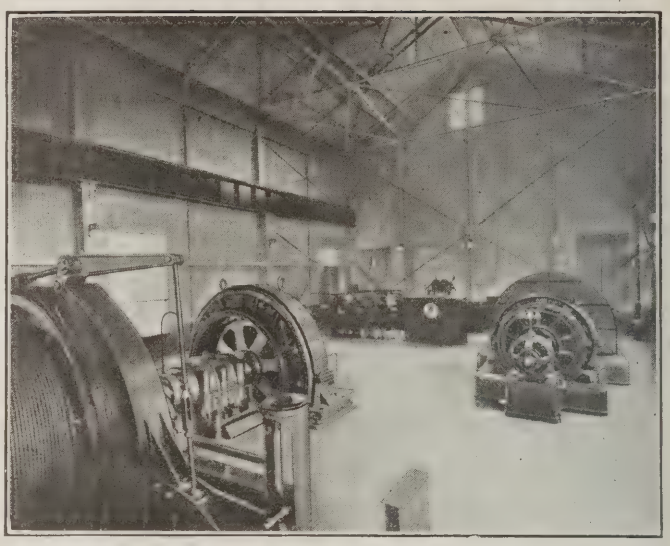

FIG. 8—COMPLETE HOISTING EQUIPMENT

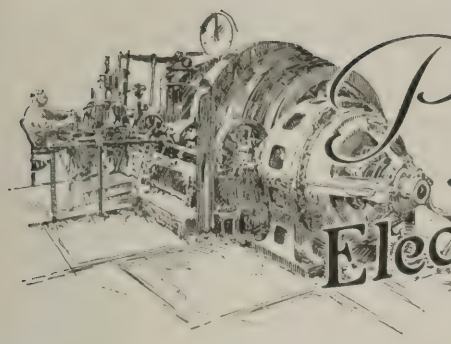
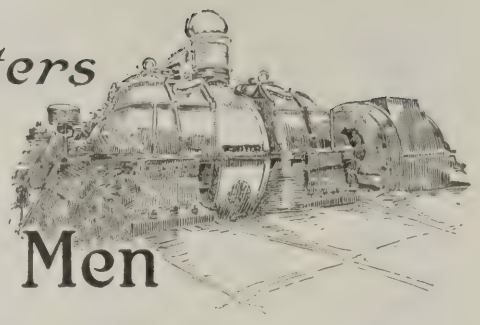
All the parts of a large hoist installation are shown here. Problems of the coal field are daily being solved by installations of flywheel hoisting equipment.

The hoist room of the North Butte Mining Co. is depicted in Fig. 8, which shows the hoist motor, flywheel, motor-generator set, slip regulator and control.



I have had the pleasure of directing the application of the above installation at the North Butte Mining Co. as well as two other installations of the same capacity, one at the Butte & Superior Mining Co. at Butte, Mont., and the other at the International Nickel Co.'s mines at Copper Cliff, Ont. The equipment at the Butte & Superior company's plant was originally laid out to add a second hoist motor and a second generator and flywheel to the motor-generator set at some later time.

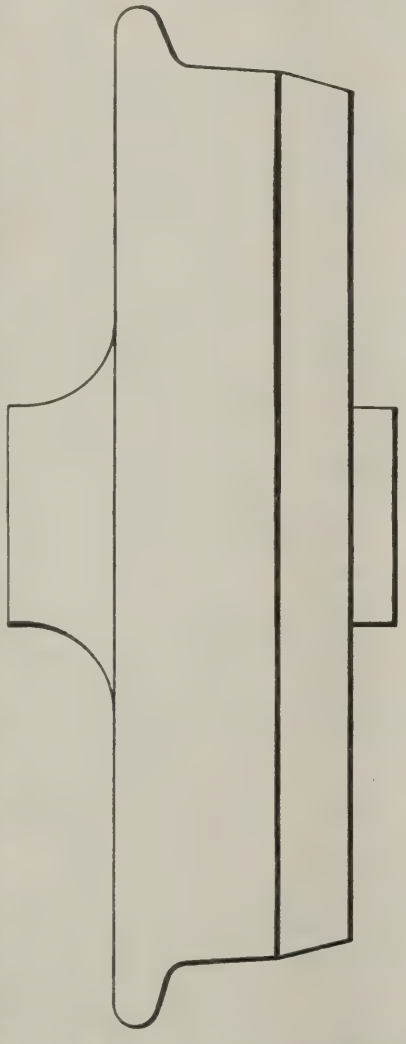
For such large and important installations as that required in the cycle shown in Fig. 2 it will be readily seen that the application and construction of such equipment should be undertaken only by those who have not only a thorough understanding of such problems but who have actually installed equipment of somewhat similar size and capacity.



Mining the Parent of Almost All Other Branches of Engineering

SPEAKING in Scranton, Pa., at the one hundredth anniversary of the founding of the Delaware & Hudson Co., April 24, W. H. Williams, vice-president of that organization, remarked as follows: "Coal was to the Delaware and Hudson Co. and its railway as cause to effect. It was that, also, to that earliest locomotive of which we boast and to the steam engine, in which every locomotive had its genesis. The first uses of the inventions of Newcomen and Watt were in pumping English coal mines. And railed roads were known to the mining practice of Newcastle-on-Tyne for two hundred years before the first common-carrier railroad came into being with the opening of the Stockton and Darlington on Sept. 27, 1825.

"Regular use of locomotives in English colliery practice antedated the Rainhill competition by not less than seventeen years. Precisely as the railway, the steam engine and the locomotive were developed as incidents of English colliery practice, just so the Delaware & Hudson's railway system was evolved to make possible the mining and marketing of the 'black stones,' 'stone coal' or 'anthracite' of the northern anthracite region."



Practical Pointers for Electrical and Mechanical Men

Prevention of False Flange on Locomotive Wheels

VARIOUS methods for preventing the formation of false flanges on electric mine locomotives have been suggested and used with some success. The method most generally resorted to is the use of a shoe with abrasive material inserts. Frequently this insert material does not seem to be properly placed or the brake shoe gets out of alignment and therefore does not cut where the false flange has a tendency to form.

Some locomotives continually work on certain curves year in and year out and the false flange invariably forms on one side of the locomotive and not on the other. Under these conditions a little study of the characteristic formation of the false flange will be found most interesting and probably will suggest possible remedies. In one such place a study was made at one of our collieries and when the wheels and axles were sent to the repair shop to have the false flange turned off, we suggested to the shop superintendent that the tire be turned down as shown in the illustration. The sketch shows how the tire was reduced in diameter where the false flange had a tendency to form. The result obtained was most satisfactory. As usual the tire wore close to the flange and eventually the tread became straight and the false flange did not form before the life of the tire was ended when the reduction in tire thickness reached the limit of safety.

WHEEL WITH TAPERED TREAD

False flanges are the cause of many derailments and high cost of track maintenance. The above shaped wheel prevented the formation of false flanges on the locomotive equipped with these wheels.

Recommended Rail Weights for Haulage Systems at Coal Mines

A POINT frequently discussed by some of the mining men of our company is on the subject of the standardization of track gages and proper size rails for different locomotives. It seems to me a very regrettable fact that track gages have not been standardized. With our company the track gages run from 24 in. to 48 in. including seven different gages, and a great amount of hardship and difficulty frequently results due to the almost utter impossibility of transferring equipment in the event of breakdowns. Then again, the differences in weights of rails is just as great and for the most part the rails are too light for the locomotives used.

Suggestions for standardization in these two lines, I believe, would result in much benefit to the mining companies. Perhaps a great deal of progress cannot be made on present installations, but for the benefit of new companies and mines which will be opened in the future I believe a presentation of the subject in your columns would be most interesting. ELECTRICAL OPERATOR.

In conformity with the most recent recommendations of the American Mining Congress, all coal-mining operators are urged to install in all new work a track gage of 42 in. and curves having a minimum radius of 28 ft. Recognition of the wisdom of these recommendations will, for obvious reasons, react to the mutual benefit of both purchaser and manufacturer of equipment. If for any reason deviations from the standard is absolutely necessary, such deviations should be made in 6-in. steps over or under the standard of 42 in., but where possible the standard gage should be most rigidly adhered to.

Recommendations for rail installations for various sizes of locomotives may easily be derived from a rule to allow 200 lb. on a driving wheel for each pound weight of rail per yard. For example, a four-wheeled locomotive weighing 30,000 lb. should therefore run on a 40-lb. rail. For a six-wheel locomotive of the same weight, a 25-lb. rail would be used. From the rule the following table may be constructed and should be interpreted as the absolute minimum size rail which should be used for four-wheel locomotives:

Weight of Locomotive in Tons	Weight of Rails in Pounds per Yard	Weight of Locomotive in Tons	Weight of Rai in Pounds per Yard
4 to 6	16	13 to 15	40
6 to 8	20	15 to 20	50
8 to 10	25	20 to 25	60
10 to 13	30		

When practicable, however, it is desirable to use rails of a heavier weight than in the above table, to avoid possible deflection of the rails over loose ties and earth, which would increase the resistance and thereby reduce

the hauling capacity of the locomotive. Another advantage for the heavier rail is the increased contact the wheel has on the wider rail, which greatly increases the adhesion and materially cuts down slippage, formation of false flanges and promotes better maintenance of locomotive and track.

Six Requirements of a Well-Designed Machine Foundation

FOR foundations for modern rotative and reciprocating machines it usually develops that a foundation of sufficient horizontal plane area to encompass the base and anchor bolts of the machine and of sufficient depth to reach good bottom or to go below the frost line will automatically have ample weight, proper proportions and sufficient base area to satisfy all the necessary requirements for a good foundation.

Unfortunately, this is not always true, and for this reason it is necessary to check the foundation to see if it meets the several requirements of what constitutes a satisfactory foundation.

These requirements may be briefly grouped into six rules, as follows: (1) The foundation must have sufficient properly disposed base area so that the pressure imposed by it on the supporting soil will not at any point exceed the safe foundation soil pressure for that kind of soil.

(2) The foundation should have sufficient base area and should be so disposed that there is not too great a difference between the loads imposed by the foundation on different equal areas of the supporting soil.

(3) The foundation must have sufficient weight and be of such proportions that the line of action of the resultant of the total vertical load with any non-vertical force which may be occasioned by the operation of the machine will always fall within the base area of the foundation.

(4) The foundation must have sufficient weight to prevent its sliding horizontally on the supporting soil.

(5) The foundation must have sufficient weight to prevent the supported machine from being lifted upward.

(6) The foundation must have sufficient properly disposed weight to prevent its being rotated horizontally around a vertical axis.

Renewal Costs High When Incandescent Lamps Are Not of Proper Voltage

I UNDERSTAND that the life of incandescent lamps decreases when the lamps are used on a circuit of higher voltage than their normal rating. As to just how serious a matter this may be I am not exactly clear.

I would be pleased if you would give me some information on this subject in your columns, because there is considerable argument among our men on this question, and no doubt it is a problem in the minds of many mine foremen who are trying to hold their maintenance costs as low as possible. MINE FOREMAN.

Various pieces of electrical equipment are made with a generous overload capacity. Most every motor manufacturer has designed his motors for half-hour and two-hour overload ratings. Then, again, most electrical equipment will operate satisfactorily on overvoltage or undervoltage of 10 per cent.

The wide voltage fluctuations on some of the more remote lines in the coal mines and also some of the heavily loaded lines near the generating or transforming equipment present a real question of proper voltage for lamps. The desire to standardize and keep in stock as few a number of different voltage lamps as possible is very necessary owing to the liability of the wrong voltage lamp being used when there is a large stock of variously rated lamps.

The table below very clearly shows the variation of amperes, volts, life and lumens for the average mazda lamp:

Per Cent Amp.	Per Cent Volts	Per Cent Life	Per Cent Lumens
100	100	100	100
101	101.5	82.75	105
102	103.5	64	113
103	105	53.40	119
104	107	42.75	126
105	109	33	135

Note that as low an overvoltage as 5 per cent increases the current 3 per cent and decreases the life to 53.4 per cent and increases the lumens only 19 per cent.

This means that the renewal cost for lamps will be doubled, especially when consideration is given to the cost of labor in renewing the lamp and handling the extra orders.

In the selection of a lamp consideration should be given to the above facts and a choice should be made of a lamp commercially popular so as to be able to get quick deliveries and advantage of a lower unit production cost.

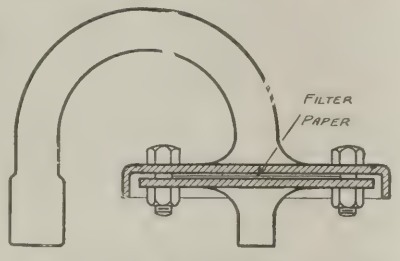
Rebabbitting Bearings for Mine Equipment

THE old babbitt should first be melted out and a suitable mandrel prepared. Split bearings should be babbitted one-half at a time, and the mandrel should consist of a half-cylinder with shoulders running along its length, on which the sides of the bearings may rest so as to form a close fit when the bearing housing is in position for babbitting.

Pieces of felt should be placed between the ends to prevent the babbitt from running into the oil well in the spaces back of the bearing shell. Use only the best babbitt metal. The melted babbitt should be poured in the gate until it begins to overflow and a few moments should elapse before it is removed from the mandrel, in order that the bearing may become quite hard.

The bearing housing should then be placed in a suitable chuck or dog and the inside turned to the proper bore. The holes for inspecting the working of the oil rings should then be drilled and the oil ring slots melted to the proper depth. The finishing can be done with a file. If the mandrel is a smooth half-cylinder the oil grooves may be shaped out, but the grooves may be cast by properly designing the mandrel.

Town Saved by Little Pump



CENTRAL LAKES, Minn., a village of 150 inhabitants, located in the timber country, recently was threatened by a large forest fire. Just when the fire was moving toward the main section of the town an Evinrude centrifugal pump was brought to the assistance of the bucket brigade. The pump had been hurriedly brought by two National Guardsmen a distance of three miles through a flaming roadway. The pump was installed in a cistern under the parlor floor of one of the Central Lakes homes and proved itself a little giant in the work of halting the progress of the flames.

New Equipment

Transformer Breather Maintains High Dielectric Strength of Oil

MORE attention is being given of late to the necessity of maintaining the high dielectric strength of transformer oil. It has long been asserted by many electrical workmen and engineers that many fires and breakdowns classed as having resulted from "unknown causes" were the result of a gradual depreciation of the insulating oil, caused either by dirt or moisture.

In the operation of transformers the oil contracts or expands, due to variations in temperature as a result of varying loads, which causes the taking in or expelling of air, commonly called "breathing." This breathing process carries air into the transformer, and moisture in the air is deposited in the transformer oil, reducing its insulating value. To prevent moisture entering the transformer due to breathing, and lowering the dielectric strength of the oil, devices called "breathers" have been used.

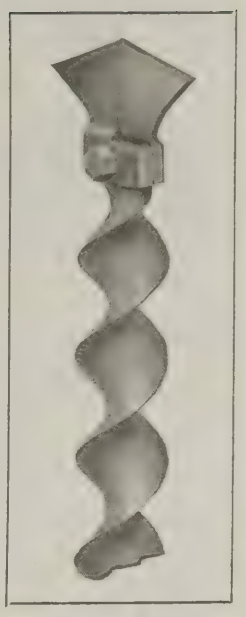
ASSEMBLED BREATHER READY FOR MOUNTING

This cross-section shows the "Pittsburgh Breather" with filter paper between two steel flanges. The opening is enlarged for the passage of air and the filter paper is reinforced on the outside by copper screening.

The principle of the "Pittsburgh Breather," manufactured by the Pittsburgh Transformer Co., for taking moisture out of the air before entering the transformer is the same as the well-known filter press principle for taking moisture out of oil.

On air entering the transformer, moisture is deposited on the outside surface of the breather, where it is dried off. The drying process is still further accelerated by the warm air being expelled from the transformer.

Detachable Bits for Drilling Augers Eliminate Blacksmithing Edges

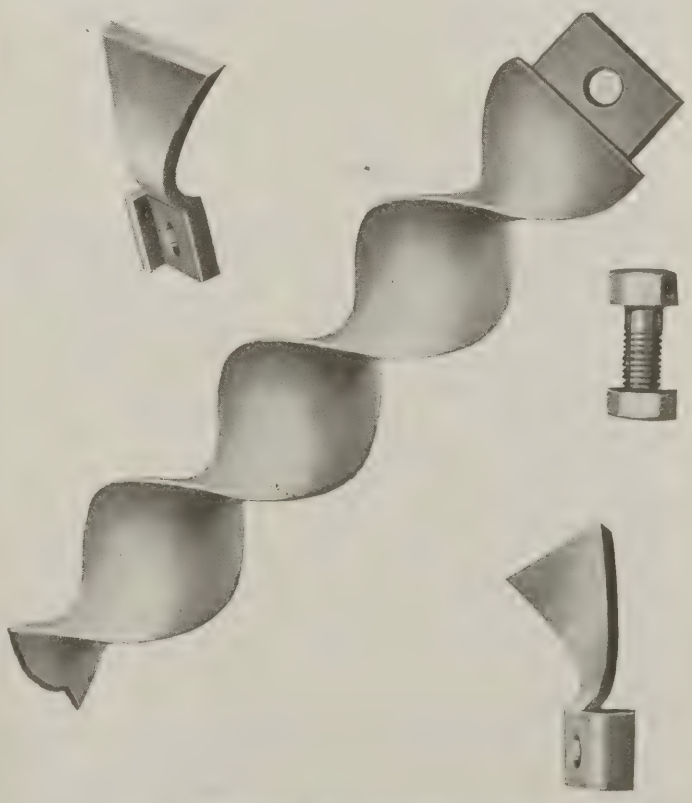


TO THE coal miner a drill is the most important article in his equipment. The importance of a good drill with a suitable cutting edge is evidenced by the fact that all miners carefully guard a new drill and are frequently noticed carrying a drill home at the end of the day.

The shape and sharpness of the cutting edges of a drill are a very direct indication of the value of a drill to the miner. A poor cutting edge on an otherwise good drill makes the drill of little value.

Several schemes have been employed to improve the utility of the miners' drill, one of the latest developments along these lines being the "Diamond" detachable bit patented and manufactured by the Jos. McGlaughlin Co., Joliet, Ill. This eliminates the old method of blacksmithing the cutting edges on a drill and then laboriously filing them into shape. Instead there is supplied a detachable bit made of chrome nickel steel.

The advantages claimed for a detachable bit of this nature are that the design is mechanically correct, the bit is made of special material best suited for cutting, it will cut a straight, even hole under any condition without undue strain or binding, it can be readily transported with the miners' tools without the danger attending the carrying of long drills near electric conductors in the mines, it readily provides an extra set of cutters and affords ease of replacement.



The bits are made up of two interchangeable parts, both fishtail and diamond point type, readily applied to almost any type and make of coal or breast drill—either old or new, thus making readily available an unlimited supply of bits for a few drills. The bits are made in all the common sizes used in mining work and are said to be durable, simple, convenient and economical.

BIT OF MANY CUTTERS

Cutters are small and easily attached to drill. New cutting edges can be kept on hand thus eliminating the necessity of transporting long drills.

The illustrations show the diamond-shaped cutters, which are the most popular type. The inclination and angles of its cutting edges have been determined and recommended as most practical by mining men. These points are of primary importance for fast cutting augers and easy running drilling machines. Several patents already have been granted and applications are pending in foreign countries.

DRILL CONSISTS OF FEW SMALL PARTS

The two cutting edges and one bolt constitute all the detachable parts. Two new cutting edges make a new drill.

Problems of Operating Men

Edited by James T. Beard

Point of Ignition Disputed in the Wakesiah Explosion

No Evidence to Support Conclusion That Ignition Took Place Near Pumpman—Mine Regulation Act Revised—Blowing Out Gas Forbidden

I HAVE read with interest the letter of "Mining Engineer," *Coal Age*, March 22, p. 493, in which he argues that the ignition of the gas, in the Wakesiah explosion of Nov. 24, 1922, must have taken place at some point near the pumpman, or outby from the point assumed in the report of that explosion, given by W. H. Moore.

Kindly permit me to correct that impression, which is based on a seeming lack of an intimate knowledge of the condition of affairs, as found after the explosion. Besides reading the account of the disaster given by Manager Moore, which appeared in an earlier issue of *Coal Age* (Jan. 25, p. 184) I have been afforded the opportunity of making a close study of the situation in that mine.

After carefully considering all the facts in the case, I have been unable to find any evidence in support of the conclusion of "Mining Engineer." Obviously, had this explosion originated outby from the point mentioned in the report, as that writer contends, the unfortunate fireboss would not have sought to escape by running in that direction. The facts show that the fireboss had run a distance of 84 ft. down the return airway, before he fell overcome with the gas.

Fireboss' Cap Burned to a Cinder

My observation convinces me that this disaster was more in the nature of an inflammation than an explosion in its initial stage. Then, as the flame traveled the entry it gained heat and energy. I believe mention has not been made of the fact that the fireboss' cap, which was picked up close to his lamp, 21 ft. from the nozzle of the compressed-air hose, was burned to a cinder. This fact appears to me to have an important bearing on determining what actually took place.

As has already been stated, the shotfiring cable was found where the fireboss had placed it on the floor close to the valve, together with the detonators or electric fuses, which were still intact and showed no signs of scorching or flame. In his report, Mr. Moore says that the interior of the lamp gauzes showed signs of having been subjected to intense heat; but this is not to say that the gauze had been red hot, as "Mining Engineer" assumes.

Owing to the fact that the firedamp mixture was considerably diluted, by the blast of compressed air thrown against it in addition to the ventilating current, the situation appears to me that when the lamp, in its overheated condition, was exposed to this high velocity, its flame passed through the gauze and ignited the gas outside, with the result that the fireboss' cap was burned while he, perhaps, made an ineffectual effort to smother his lamp.

In concluding his letter, "Mining Engineer" suggests that, "a safety lamp is safer when the wick flame is at its full height, provided it does not smoke." To my mind, this is a pernicious doctrine, since the principle of a safety lamp depends on the cooling effect of the gauze. Certainly, the lamp gauze would be hotter when the flame was at its full height and its cooling effect would then be proportionately lessened.

When a lamp with its flame burning at full height is exposed to an atmosphere containing a small percentage of gas the height of the flame is considerably lengthened; and it is possible that this fireboss was not aware of the danger until too late and his lamp had filled with flame. My belief is that it is safer to carry a smaller flame, which will give out less heat and provide a wider margin of safety.

Mines Regulation Act Amended

It is worthy of mention that this disaster has drawn the attention of the Mines Department of British Columbia to the danger of the practice of blowing out the gas with compressed air. As a result, the Coal Mines Regulation Act has since been amended, forbidding that practice. Without doubt, the lesson to be learned is that relating to human fallibility and the need of absolute caution and care in the use of flame safety lamps. No amount of knowledge can safeguard us if that knowledge is not applied.

In closing, let me say that the human factor is always present. We are prone to omit to take the precautions that our better judgment should tell us are needed to insure safety. Why does not the present inventive age produce a universal means of detecting gas that will eliminate the present hazard? The fact that we are still using the modified devices of 100 years ago for this purpose would seem to reflect on the ingenuity of the mining world.

J. Hynd.

Nanaimo, B. C.

ANOTHER LETTER

More information needed—Position of pumpman and motor driving pump should be stated.

IN THE discussion of the probable cause of the Wakesiah explosion, it is quite noticeable that no one, not even the report first given by the manager, has stated the exact position of the pumpman when found, following the explosion. All that has been said is that he was working on the return airway, at a point about 250 ft. distant from the fireboss where it was assumed the explosion started.

It would be interesting as well as important to know the position of the motor driving the pump. It has

been stated that the pumpman was working with an electric lamp. That being the case, he had no means of knowing the highly explosive condition of the air current bearing down upon him, the ignition of which a few moments later killed him.

In my opinion, it is a waste of time to discuss the possibilities of the failure of the safety lamp carried by the fireboss. It is not probable that he exposed his lamp to any such pressure as 90 lb. per sq.in., which was said to be the pressure in the compressed-air line. This pressure, of course, would be quickly reduced when the air left the nozzle of the pipe.

That the Lamp Failed Is Improbable

The failure of this double-gauze bonneted lamp of approved pattern is quite unlikely in the hands of a competent fireboss. As has been proved by many experimenters, a safety lamp if tilted from a vertical position becomes dangerous, because the circulation does not then pass up the chimney and out through the top, but escapes through the gauze just above the glass.

In that position of the lamp, it is possible for an explosive mixture to form and almost fill the lamp, before reaching and being ignited at the wick. In this respect I consider the old Stephenson ("Geodie") lamp was dangerous. In that lamp, the air holes below the flame were too small to admit the air required for the combustion and air entered the lamp above the glass even when the lamp was in a vertical position.

Mining Engineer, No. 2.

————, Alberta, Canada.

Reconstruction in Coal Mining

Aftermath of the war—Conditions much changed in the mining of coal—To get efficiency in production the real problem.

SPEAKING of efficiency in the management of mines, many suggestions have been made as to how this is to be obtained in the present state of affairs. It will be generally agreed that we have not, as yet, recovered from the effects of the war. At that time, it was necessary to try any expedient that would count and the slogan was, "Anything to win the war."

Now, conditions are changed and mine officials are beginning to look about them to ascertain what is needful to improve the situation, which has come as a result of the trying ordeal through which this and other countries have passed during the last few years. In my opinion, most mining men are in a dilemma as to where and how to begin to secure efficiency in the operation of their mines.

Inefficiency Resulting from the War

It cannot be denied that the war situation has created a vast army of raw recruits in the mining of coal. This is true, not only in respect to the class of miners now employed in many of our mines; but there have been opened and many attempts made to operate new mines, most of which must prove, sooner or later, financial failures. Even in the older mines, conditions are such, today, that the problem of producing clean merchantable coal is no joke.

Careful study of the situation should cause many investors in mining property to make a searching inquiry into the manner in which their capital is being employed, not to say squandered; and to ascertain what means and methods of reconstruction are under way that will insure increased efficiency in the various operations and management of the mines in which their capital is invested.

Competition is the life of trade, it is true; but that does not warrant the throwing away of thousands of dollars of invested capital where the prospective returns do not warrant the outlay. In making this statement, it is not my wish to offend any of our able mine managers. It is my desire, only, to put the case as one should view it from an economic as well as a practical standpoint and without prejudice.

Foresight and Thrift Now Needed

There are instances where the mine management have not displayed the foresight they should. It reminds me of the mother of a large family, who, in attempting to supply the needs of John, Sarah and a dozen others, found, too late, that the loaf would not go round. Sending to the store failed to get more, as the supply was exhausted, and some of the children had to go without.

Let us remember that war conditions are now obsolete and we must display foresight and thrift in the management of our mines, in our efforts to make the payroll bear a margin of profit and that one and all may be satisfied. To accomplish this in the various departments of the larger coal companies will require careful inspection and a systematic weeding out of what is not required. In other words, the slogan in mining today should be "reconstruction." System is needed in every branch of the work, which must be co-ordinated. At the same time, each department must stand on its own footing. In other words, as the old saying puts it, "Every tub must stand on its own bottom," here as elsewhere.

Gans, Pa. R. W. Lightburn.

Gobbing Slate in Room-and-Pillar System

Two systems of working, advancing and retreating—Rooms widened and gobbed according to two rules, affording protection for track.

BEING familiar with the methods in common use in the mining of coal is Kentucky, I take the liberty of offering a few additional comments and suggestion in reply to the inquiry of A. L. Trimble, Big Shoal, Ky., which appeared in *Coal Age*, Apr. 12, p. 608, asking for the best method of gobbing the slate taken down in rooms driven to right and left of a pair of entries.

Two systems of working are commonly employed, the advancing and retreating methods, depending largely on the character of the roof, floor and coal of the seam. In the advancing method, the rooms are turned and driven to the limit as the entries are advanced. In the retreating method, no rooms are turned till the entries have reached the boundary or limit, and room turning starts at that point and proceeds outby.

In the advancing system, the pillars may be drawn back as quickly as each room reaches the limit; or the robbing of pillars may be delayed until all the rooms in a section are furnished. In the retreating system, however, the robbing follows closely the extraction in the rooms.

Now, with this explanation, all that remains to be said, in respect to the gobbing of slate in the rooms, is included in two rules, as follows:

1. If pillars are to be drawn as soon as rooms reach the limit, all rooms turned to the right must be widened and gobbed on the left; and all rooms turned to the

left must be widened and gobbed on the right. In each case pillarwork must then start in the second room.

2. If the work of drawing pillars is to be delayed and pillars are to be taken out on the retreating system, all rooms turned to the right (advancing) or to the left (retreating) must be widened and gobbed on the right; and, *vice versa*, rooms to the left (advancing) or to the right (retreating) must be widened and gobbed on the left. The work of drawing pillars must then start on the track of the next-to-the-last room inby.

By following these two rules, the track on which the coal is to be hauled out will always be protected from the falls in the waste left behind.

Pikeville, Ky. GEORGE EDWARDS.

Inquiries Of General Interest

Planning Working a Coal Property, Two Steeply Pitching Seams

Two Anthracite Seams, Pitching 45 Deg., Separated by 125 ft. of Sandstone—Physical Conditions Require Approach on Hanging-Wall Side

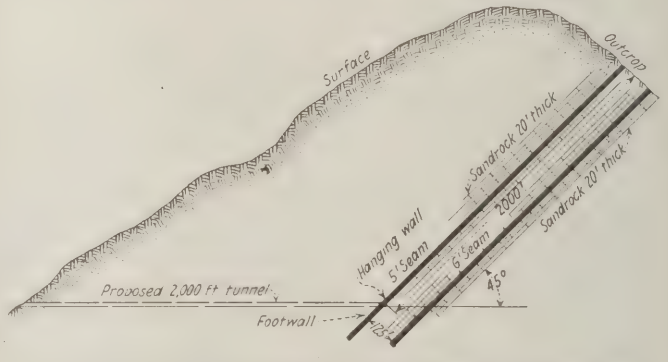
WE ARE trying to work out the best possible plan of opening and developing an anthracite property and would greatly appreciate seeing the proposition discussed by the many practical readers of *Coal Age*. With this idea in view I am taking the liberty of presenting for their consideration the condition and requirements as they exist:

There are two seams lying at angle of about 45 deg. and outcropping on the surface. The two seams are separated by 125 ft. of solid strata and both the hanging wall and the footwall in each seam are massive sandstone beds of about 20 ft. in thickness. The coal is 5 ft. thick in one seam and 6 ft. in the other.

To make clear the situation, let me state a few points as requirements and outline our general ideas in regard to the proposition. The physical conditions are such as to require approaching these seams from the hanging-wall side. Study of the situation in all its bearings has determined us to start by driving a 2,000-ft. crosscut tunnel to reach the coal on the side of the hanging wall. We contemplate the probable total extraction of one of the seams, before starting development in the other.

When the crosscut has reached the coal in the upper seam we plan to drive a level each way in that seam, extending it to the property lines on either side. From this level raises will be driven on the full pitch of the seam at distances of 400 ft. apart, and extended up the pitch to the outcrop on the surface, a distance that will approximate 2,000 ft. One advantage gained by this plan is that it affords means of ample natural ventilation.

Having finished these raises, we may then undertake to extract all the coal on some retreating plan that seems to be practicable, possibly a modified longwall applied to limited sections. Another method would be to crosscut each panel, between successive raises, at short intervals adapted to driving chutes and working out each section, in turn, starting from the top and proceeding downward, drawing back the pillars as the chutes are finished.



Our first thought, in reference to the longwall plan, was to employ retarding conveyors for lowering the coal to the gangway level. In the chute method, there should be no difficulty experienced in keeping the coal moving on this inclination, especially with the use of sheet iron on the floor of each chute. Someone has suggested the use of endless traveling cables, in each raise, the portion of the cable moving downward along the floor, as a means of keeping the coal moving. While it is claimed that the operation of the cables would require little power, the plan does not appeal to me as practicable.

We hope this outline will draw forth a good discussion and result in many valuable suggestions coming from the experiences of others working under similar conditions. L. L. TRAVIS.

Ophir, Utah.

Had this correspondent favored us with a sketch or profile it would have assisted in making clearer the exact situation. It would also be both interesting and helpful to know what are the "physical conditions" that make it necessary to approach these seams from the side of the hanging wall. We will assume that they relate solely to the location of shipping facilities and surface plant and in no way affect the mining of the coal.

Since these two seams are said to outcrop and have an inclination of about 45 deg., the fact that they

ASSUMED PROFILE SHOWING PROBABLE SITUATION

must be approached from the hanging-wall side would suggest a situation somewhat similar to that we have outlined in the accompanying figure, showing the proposed 2,000-ft. tunnel driven on the side of the hanging wall, and the two seams 125 ft. apart and inclined at an angle of 45 deg.

The plan of driving a gangway level, right and left in the seam where it is intersected by the cross-tunnel and extending these levels to the property lines on either side cannot be improved. Also, the laying out of the seam above the gangway in panels, by driving rise headings on the full pitch of the seam is good. In the further development of the seam, the retreating longwall face with the employment of a face conveyor will probably give good results under this sandstone roof. There is no difficulty to be expected in the sliding of the coal on this steep pitch. The hardness of the anthracite will favor the use of retarding conveyors, requiring little or no power in their operation.

This is an excellent problem for discussion by practical mining men, who will be able to offer many valuable suggestions from their varied experiences and we hope for a good response to this appeal.

Examination Questions Answered

Examination for Mine Managers, Springfield, Ill., Mar. 19, 1923

(Selected Questions)

QUESTION—*Two drill holes one mile apart are put down to a coal seam; the depth of the first is 634 ft. and that of the second is 850 ft.; the surface at the former is 25 ft. above the latter. What is the inclination of the coal seam between the two points measured in inches per yard?*

ANSWER—The bottom of the second hole below that of the first is 25 + 850 — 634 = 241 ft. One mile is 5,280 ft. or 1,760 yd. The inclination of the seam, therefore, is (241 × 12) ÷ 1,760 = 1.643 in. per yd.

QUESTION—*What is the proportion of marsh gas and air in a firedamp mixture that will develop a maximum explosive mixture?*

ANSWER—The proportion of gas to air at the maximum explosive point of the mixture (methane and air) is 1:9.57, or approximately 1:9½.

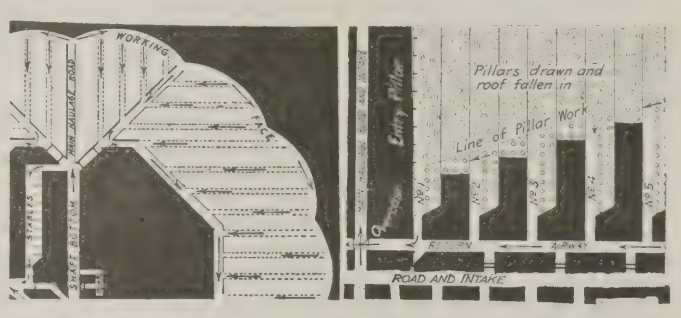
QUESTION—*What are the limiting proportions that determine an explosive mixture of pure methane and gas?*

ANSWER—The limiting proportions forming an explosive mixture of these gases are, lower limit 1:13; upper limit 1:5. Actual explosion of the mixture, however, depends largely on the purity of the gas, the normal state of the air and the intensity of the flame causing ignition.

QUESTION—*How many cubic feet of marsh gas will be required to be generated in a mine per minute to render dangerous a current of 30,000 cu.ft. of air per minute?*

ANSWER—Much depends on the character of the coal in respect to its hardness and inflammability, also the condition of the mine with respect to dust. In an anthracite mine 3 per cent of gas would not be considered dangerous, while in a bituminous mine and a highly inflammable coal 1 per cent of gas in the current will often be dangerous. In this case, assuming the danger point is reached when the proportion of gas to air is 1:40 (2½ per cent) the volume of marsh gas required to render dangerous an air current of 30,000 cu.ft. is 30,000 ÷ 40 = 750 cu.ft. per min.

QUESTION—*What causes the variation of the temperature of the air when it is passing through the mine? Does such change of temperature affect the volume of air passing? Explain fully.*



ANSWER—The temperature of a mine is quite uniform as compared with that of the outer atmosphere, summer and winter. While in summer the air entering the mine may be warmer than the mine air and give up some of its heat in passing through the mine, a more general condition is that when the outside air enters the mine at a lower temperature than that of the mine and absorbs heat in passing through the workings. The heat of the mine is the natural heat of the strata, which increases with the depth below the surface after the first twenty yards of depth.

In shaft mines the change of temperature in the air in circulation produces an air column that assists the circulation of the air in the winter season and often retards the circulation produced by a fan in the summer time. The action assisting or retarding the circulation, in fan ventilation, will depend on the position of the fan in respect to the mine openings and whether it is blowing or exhausting the air.

QUESTION—*Show clearly by means of sketches the two common methods of working a coal field, giving the conditions favorable to the application of these methods.*

ANSWER—In the accompanying figure are shown the longwall method of mining on the left and the room-and-pillar system of mining on the right. These are the two common methods employed in the mining of coal. The longwall method is particularly adapted to working thin seams of coal and when mining at great depths where the roof pressure is excessive. This method is also favorable to the complete extraction of the coal where conditions will permit of its adoption.

The room-and-pillar method shown on the right of the

SHOWING TWO COMMON METHODS OF WORKING

figure is applicable to the mining of coal under ordinary conditions and where the roof conditions will not permit of the use of the longwall method. The advancing system shown in the figure permits of quick returns on the capital invested in the development of the mine.

QUESTION—*In a certain mine there are two sections ventilated by separate air currents. The combined length of the intake and return in one of these sections is 6,000 ft.; the number of men employed is 110 and the number of mules, 10. In the other division, the length of the airway is 3,000 ft.; the number of men is 110; and the number of the mules 7. What will be the proper distribution of the air sent into the mine and what steps must be taken to secure such a distribution?*

ANSWER—The Illinois Mining Law requires an air volume of 100 cu.ft. per man and 500 cu.ft. per mule employed underground in a non-gaseous mine. To comply with this law will require 16,000 cu.ft. per min. as the circulation in the first mine where the length of the air-course is 6 000 ft.; and 14 500 cu.ft. per min. in the second mine where the length of the air-course is 3,000 ft. Other things being equal, the volume of air circulated in natural division, varies inversely as the square root of the length of the airway. The natural division of air between these two airways is, therefore, in the ratio $\sqrt{3}:\sqrt{6}$; or $1:\sqrt{2} = 1:1.4$, in favor of the shorter air-course. That is to say for every 100 cu.ft. of air passing in the first airway (6,000 ft. long), there will be 140 cu.ft. per min. passing in the second airway (3,000 ft. long). Therefore, in order to reduce the air volume in the shorter section and increase the circulation in the longer section where the larger qantity of air is required it will be necessary to install a regulator in the shorter air-course.

To Confer on Reduction of Freight Waste

Reduction of waste in freight transportation will be considered at a conference on June 13 at the Department of Commerce. F. R. Wadleigh, who is making the arrangements for the conference, states that he believes savings which will run into huge sums can be made if more attention is given to prompt loading and unloading of freight cars, to obtaining a higher average day's mileage, to the loading of cars to capacity, and to a large number of opportunities which are offered shippers and transportation companies to eliminate waste.

Call Strike at Railroad Brotherhood Mine

Union miners of the Coal River Collieries Co., West Virginia, are on strike, according to Secretary Fred Mooney, of District 17, United Mine Workers. The company's board of directors is headed by Warren S. Stone, president of the Brotherhood of Locomotive Engineers, and although the Brotherhood organization is not directly connected with the company, the latter is made up mainly of Brotherhood members.

The issue, according to Mooney, is unionization of the mine. He declared nearly all the employees had quit work because the company announced it would be run on an open-shop basis, and refused to recognize a local union.

Between sixty-five and seventy-five men are out and non-union miners are being employed to take their places.

At a conference between Mooney and Warren S. Stone, Brotherhood President and Chairman of the Board of Directors of the mining company last year, Mooney said Stone told him that the mines would operate on the union basis as soon as they were opened. On this understanding union miners on strike at other mines were given permits to work at the mines.

Mooney also declared that William Blizzard, president of sub-district No. 2, in whose territory the alleged strike has occurred, went to the mine to attempt to arrange a settlement, but that the management declined to see him.

At his office in Cleveland, May 29, Mr. Stone admitted that the mines were not fully unionized, but asserted that the men had his permission to join the union if they desired. He said he had received no reports on any strikes.

"We are paying the union scale in West Virginia," he said. "In east Kentucky, where the Coal River Collieries also have mines, the miners have not been organized for twenty years, but we are paying the going rate in eastern Kentucky."

Coal-Mine Fatalities in April Higher In Number and Ratio to Output

Accidents at coal mines during April, 1923, caused the death of 175 men, according to reports received by the Bureau of Mines from state mine inspectors throughout the country. This number cannot be compared with the 78 fatalities in April, 1922, because half of the mining industry was idle in April last year on account of the miners' strike. The fatality rates per million tons, however, are comparable; and the figures show a rate of 3.49 for April, 1923, as against 4.87 for April, 1922. In March, 1923, there were 168 fatalities, or 2.99 per million tons produced.

The figures for April have brought the total number of fatalities for 1923 to 851, indicating a death rate of 3.96 per million tons, as compared with 671 fatalities during the first four months last year, representing a rate of 4.04 per million tons.

The year's record to date for all fatalities from all causes shows that the fatality rate per million tons has been slightly reduced as regards haulage and falls of roof and coal, but that it is still above last year's record as regards explosions of gas and dust. These facts are indicated by the following figures showing the death-rates per million tons during the first four months of each year:

	1922	1923
Falls of roof and coal	1.902	1.753
Haulage	0.794	0.618
Gas and dust explosions	0.554	0.785
Explosives	0.180	0.168
Electricity	0.102	0.107

COAL-MINE FATALITIES DURING APRIL, 1923, BY CAUSES AND STATES

(Compiled by Bureau of Mines and Published by *Coal Age*)

State	Underground													Shaft					Surface							Total by States	
	Falls of roof (coal, rock, etc.).	Falls of face or pillar coal.	Mine cars and locomotives.	Gas explosions and burning gas.	Coal-dust explosions (including gas and dust combined).	Explosives. Howatism Is Rising Again in United Mine Workers' Organization

With the slack summer season have come indications of sporadic radical activity among the miners of the Kansas field. The most recent, and the most pronounced, was a meeting of the "Progressive Miners' Organization," at Franklin, near Pittsburg, May 29. Approximately 500 members of the northern Crawford County section of District 14, United Mine Workers, are reported to have attended, in defiance of a threat by the district board that they would be expelled. August Dorchy, vice-president of the district under the deposed Alexander Howat, was chosen a delegate to the "Progressive Miners'" conference at Pittsburgh, Pa., June 2 and 3.

Caleb Harrison, of Chicago, member of the Chicago machinists' union and representative of the "Progressive Miners'" committee, was the imported speaker. He had out his little hammer for John L. Lewis, international president, and Van R. Bittner, special representative of the United Mine Workers, while speakers from among the local miners directed their knocks at the district board. All united in an effort to make the Howat ghost walk again. It was as the bearer of a personal message "direct from Howat" that Harrison was advertised.

"The 'Progressive Miners'" movement is designed to put the Lewises and the Bittners where they belong," Harrison informed his hearers, "and Howat where he belongs. If you are thrown out of the organization, just consider yourselves members and support this move and soon men like Alex Howat will be at the head of the United Mine Workers, guiding it to success. Howat is more a member of the United Mine Workers today than Lewis, and he is the bigger man of the two." Harrison added that Howat will attend the conference in Pittsburgh and is a stanch supporter of the "Progressive Miners" movement as a means of ending the Lewis régime. He advocated a national labor party, and distributed a booklet by William Z. Foster, recently tried on a charge of criminal syndicalism, on "The Bankruptcy of the American Labor Movement."

Harrison denied the "Progressive Miners' Organization" is a dual organization to the United Mine Workers, and emphasized the importance of the "Progressive Miners" working within the United Mine Workers organization.

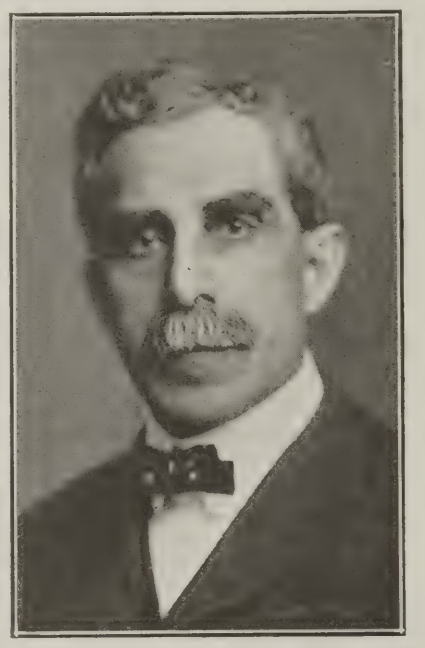
Miners who attended the meeting at Franklin were suspended from the union June 2, by the district board, which declared the "Progressive Miners" a dual organization to the United Mine Workers.

Public Contracting in Kentucky Gives Good Idea of Prevailing Prices in That State

Some contract business which has been placed in Kentucky during the past few days gives an interesting line on contract prices. The State Board of Charities and Corrections at Frankfort has bought coal for the state institutions, contracts having been awarded.

The Cornett Lewis Coal Co., Louisville, received a contract for approximately 6,500 tons of Harlan nut and slack at $2.25 a ton at mine, carrying freight rate of $1.79 a ton to Lakeland. The Frankfort Elevator Coal Co., Frankfort, operating mines at Beattyville and shipping by its own barge lines to Frankfort, took two contracts on a delivered basis, at $3.40 for the State Reformatory and $3.25 f.o.b. Frankfort, for the Feeble Minded Institute. The Harlan Coal Co., Louisville, received the Greendale contract at $2.40 at mine for Harlan run of mine, carrying a freight rate of $1.62 to Greendale. The R. C. Tway Coal Sales Co., Louisville, received the Lexington contract at $2.25 a ton at the mine, carrying $1.62 freight rate to Lexington.

The Belle Union Coal Co., operating in western Kentucky, received contract for 3,750 tons of western Kentucky pea and slack, $1.50 a ton at mine, to be shipped to Eddyville, on a freight rate of $1.47 a ton. The Gordon Mining Co., Madisonville, received the Hopkinsville contract, of 6,250 tons, at $1.85 a ton at mine, carrying freight rate of 79c. to Hopkinsville.



The Board of Education at Louisville also placed its contracts, which call for 4,106 tons of eastern Kentucky nut and slack at $1.96 a ton at mine, and 221 tons of eastern Kentucky lump at $3.06 a ton, carrying freight rate of $1.69 from mine to Louisville. The H. B. Jones Coal Co. received contract for 1,375 tons of eastern Kentucky nut and slack at $4.34 delivered and 228 tons of eastern Kentucky lump at $5.84 delivered.

Captain W. A. May Claimed by Death

Captain William A. May, president of the Pennsylvania Coal Co. and the Hillside Coal & Iron Co., died at his home in Scranton, Pa., June 1, after an illness of nearly three weeks. He was 72 years old.

Captain May was the son of Rev. Lewis and Louisa (Haine) May and was born in Hollidayburg, Blair County, Pa., Dec. 3, 1850. He received his early education in the public schools in the towns where his father's ministerial duties called the family. When he was but fourteen years of age his father died and three years later his mother was summoned by death.

He prepared for college at Dickinson Seminary, near Williamsport, where he was awarded the degree of bachelor of arts. While a seminary student he made a special study of civil and mining engineering and after leaving school he was given a position as rodman with the Hillside Coal & Iron Co.

WILLIAM A. MAY

Captain May matriculated at Lafayette College, graduating in 1876 as a civil engineer. He likewise received a degree of master of arts. After completing his education, Captain May returned to the Hillside Coal & Iron Co. as chief engineer.

Two years after rejoining the Hillside Coal & Iron Co. Captain May added to his duties those of chief engineer for the North Western Mining & Exchange Co. In 1883 he was made superintendent of the Hillside Coal & Iron Co. and served in that capacity until 1901, when he was made vice-president and general manager of the Pennsylvania Coal Co. and the New York, Susquehanna & Western Coal Co. In 1913 he became president of the Pennsylvania company and of the Hillside Coal & Iron Co.

Part of the training of Captain May as a handler of men was received as a member of the national guard of Pennsylvania. He enlisted as a private in the Thirteenth Regiment in February, 1878. Ten years later he was mustered out as captain of Company D. Captain May was the holder of a ten-year marksmanship medal and always retained an active interest in the regiment. He devoted much time and service to the erection of the Thirteenth Regiment Armory.

Besides his work in the coal industry, Captain May was identified with a number of the business industrial activities of Scranton. He was a director of the Third National Bank, a trustee of Lafayette College and of Dickinson Seminary; the Young Men's Christian Association and of Elm Park Church.

Captain May married Emma Louisa, daughter of Mr. and Mrs. B. L. Richards, of Williamsport. She survived together with one daughter, Mrs. Page, two brothers, George May of Williamsport, and L. H. May, of Forest City.

Navy Department Awards Coal Contracts

The Navy Department awarded contracts June 4 for more than 300,000 tons of bituminous and semi-bituminous coal required by navy yards and naval stations during the coming fiscal year, beginning July 1.

Awards made were: Boston, 30,000 tons, to W. A. Marshall & Co., New York, at $7.41 a ton; South Brooklyn, 9,000 tons, to George D. Harris, New York, $6.30; Iona Island, 2,000 tons, to George D. Harris, New York, $5.79; Lake Denmark, N. J., 1,800 tons, to George D. Harris, New York, $6.67; Lakehurst, N. J., 4,900 tons, to George D. Harris, New York, $6.15; Philadelphia, 45,000 tons, to Fidelity Coal Mining Co., Philadelphia, $5.83; Fort Mifflin, Pa., 450 tons, to George D. Harris & Co., New York, $5.41; Philadelphia, 20,000 tons, Morrisdale Coal Co., Philadelphia, $5.52 delivered at pier, $5.67 delivered at wharf.

Annapolis, Md., 35,100 tons, to Dexter & Carpenter, Inc., New York, $6.50; 1,650 tons to Hall Bros. & Co., Baltimore, $7.20; Annapolis, Md., 2,100 tons, to Hall Bros. & Co., Baltimore, $6; Washington, D. C., 300 tons, to Dexter & Carpenter, $5.92; Bellevue, 50 tons, Dexter & Carpenter, $5.92; Alexandria, 1,150 tons to Dexter & Carpenter, $6.32; Washington, D. C., 50,000 tons, Quemahoning Coal Co., Somerset, Pa., $6.29.

Indian Head, Md., 33,000 tons to Fidelity Mining Co., at $6.19 a ton; Indian Head, Md., 10,000 tons to Consolidation Coal Co., of Washington, at $7.30; Hampton Roads, 22,000 tons, to C. G. Blake Co., Cincinnati, $6.88; Norfolk Navy Yard, 45,000 tons to Fayette Smokeless Fuel Co., Mount Hope, W. Va., at $6.88.

Charleston, S. C., 10,000 tons to L. A. Snead Co., Washington, at $7.54; Pensacola, Fla., 8,700 tons to Adams, Rowe & Norman, Birmingham, at $3.03; Great Lakes, Ill., 2,000 tons at $2.65, and 30,000 tons soft screenings at $1.75 to Lake Export Coal Sales Corporation, Chicago; 400 tons screened lump coal over two inch screen to Cosgrove & Co., Johnstown, Pa., at $2.30.

Expect Big Turnout at Retail Convention

Reports from sub-committee chairmen throughout the country indicate a record attendance at the sixth annual convention of the National Retail Coal Merchants' Association, to be held at Scranton, Pa., June 25, 26 and 27, 1923. Reservations are now coming in as fast as they can be handled. They have been received from such wide separated points as Canada, Colorado and North Carolina.

Those who have accepted invitations to speak are F. R. Wadleigh, Federal Fuel Distributor; John Durkan, Mayor of Scranton; E. W. Parker, of the General Policies Committee, Anthracite Operators; George H. Cushing, editor of Cushing's Survey; and J. C. Bryden, chairman of the Bituminous Operators', Special Committee. Another speaker of national importance (to be announced later) is expected to address the meeting. A number of operators and newspaper men will be guests of the retailers.

Music is being arranged, a song leader has been engaged and novel entertaining features have been prepared.

Draft Tentative Plans for Certification Of Coal for Export

Coal exporters, railroad officials, representatives of testing laboratories and of the government had a conference with the Federal Fuel Distributor and the Bureau of Mines in Washington on May 24 to consider the possibility of working out a plan for the certification of coal for export.

It was tentatively agreed that a plan based upon the informal co-operation of the Bureau of Mines and the Department of Commerce might be worked out whereby the coal shipper and the railroad would note on the waybill the mine from which the coal originated. Inspectors would be provided at the various piers to record, from the notes thus provided on the waybills, a complete statement of the origin of the coal making up each cargo for export, which statement would be used as a government certificate showing the origin of the coal.

A pamphlet is to be prepared stating "in general terms the characteristics of the coal of each of the commercial districts exporting," which pamphlet, with more detailed information, is to be compiled by the Bureau of Mines and the Federal Fuel Distributor and is to serve as a guide to the buyer.

Participation is to be entirely voluntary, the cost to be paid by the exporters. The total cost to cover Norfolk, Baltimore, Philadelphia and Charleston is estimated at $24,680 per year.

Railroads Ask Chance to Solve Problems Without Fear of Confiscation

Adoption of a policy by the American people that will insure the railroads of this country fair treatment and enable them to work out their problems without fear of action "of a confiscatory nature" for a time at least was urged in a report filed June 4 with the U. S. Coal Commission by a special committee appointed by the American Railway Association to render such assistance as possible to the Fact-Finding Commission. The report supplements a preliminary one filed five months ago by the special committee of which J. E. Roberts, of Albany, N. Y., superintendent of transportation of the Delaware & Hudson Co., is chairman.

In concluding its report as to the causes of the fuel situation and possible remedies the report said:

"There can be no doubt that the railroads of the United States are vitally interested in the work of your commission. It has been said that the principal problem of the coal industry is the problem of distribution. Without committing ourselves to the absolute correctness of this statement, we are sensible of the fact that the coal industry cannot be put upon a sound basis acceptable to the American people unless coal is transported with reasonable promptness and in the most efficient manner. It is the task of the railroads to furnish this transportation. This task has been rendered difficult by certain features characterizing the production of coal which your commission thoroughly understands and which all students of the problem are endeavoring to eliminate.

"It is clear that if some method could be devised whereby the amount of coal which the country demands could be removed throughout the year in fairly constant quantities so that heavy seasonal movements would be avoided, the railroads of the country are sufficiently equipped to take care of the demands upon them in a satisfactory manner. Even if allowance is made for an increased demand for coal during the period of heaviest domestic consumption the railroads could meet the situation without serious cause for complaint. But the railroads do not feel that they are properly censurable for not being able to meet all the demands for transportation in years when strikes in the coal industry have stopped production for a considerable period, making it necessary to crowd a year's business into a few months and that too at a a time when there is the heaviest movement of other seasonal commodities.

"Of course the undertaking of the railroads to meet demands upon them must depend upon the ability of the railroads to increase their facilities as the business of the country increases. These facilities cannot be procured without the expenditure of new capital, which must come from the investing public. It is clear that capital will not be attracted to railroad securities unless there is a reasonable assurance that the investment is safe.

"These considerations lead us to suggest that there are two fundamental conditions which the public must establish before the problem of distributing coal will be solved. These are: First, fair treatment to the railroads under which they will be permitted to earn a fair return upon the value of their property fairly ascertained, and second, freedom from strikes, both in the coal and railroad industry, so that these two essential businesses may function without disturbing interruptions."

The report says that there has been a general increase in efficiency on the part of the railroads in freight transportation in recent years. In 1922, the report said, Class 1 railroads handled 19.2 per cent more revenue freight, measured in net ton miles, with 9½ per cent less freight-train miles than in 1914. In 1921 the performance was 7.7 per cent more freight traffic than in 1914 with 13½ per cent less train miles.

Coal Commission Hears Lewis on British Coal Situation; Data for July Report Nearly Complete

By Paul Wooton
Washington Correspondent of *Coal Age*

The coal industry in England is in a bad way, in the opinion of John L. Lewis, president of the United Mine Workers of America. The wage being paid mine workers in England, based as it is on the selling price of coal, is insufficient, Mr. Lewis told the President's Coal Commission, to allow the workers to live in other than a state of poverty. Mr. Lewis left the impression with the commission that the British producers are in no position to increase the price of coal. The situation, however, has been improved somewhat by the increased demand for British coal which has grown out of the occupation of the Ruhr.

Chairman Hammond and Dr. Smith, who represented the commission at the conference with the press Friday, would give little additional information as to what had been told them by the Mine Workers' president. They did state positively that there had been no discussion of the anthracite wage scale. One of the points which Mr. Lewis brought to the attention of the commission, Mr. Hammond revealed, was that of the relative productivity of the average mine worker in America as compared with the average mine worker abroad. Mr. Lewis declared that the American mine worker is several times as efficient as the foreign coal digger. He pointed out, however, that British coal mines are safer places to work in than are the mines in the United States. Mr. Lewis made the point that there must be closer co-operation between operators and their employees looking to the lowering of the accident hazard.

During his stay in Washington Mr. Lewis had no conference with the press. To the few newspapermen who were able to see him he made only perfunctory statements and indicated that he does not desire at this time to reply to the questions which naturally would be put to him by representatives of the press. He is to appear again, however, before the Coal Commission prior to the drafting of the anthracite report. It is known, however, that Mr. Lewis covered practically the entire ground covered by the anthracite operators and indicated the points of difference between the employers and the mine workers.

Anthracite Finances Elicit Interest

The commission now is busily engaged in digesting the important staff reports submitted on June 1. Particular care was taken with these reports, as they will furnish the basic information for the anthracite report. Much attention was given the report of Prof. J. H. Hollander, which deals with the financial aspects of the anthracite situation. In addition to the written report, Professor Hollander and members of his staff discussed the subject matter orally with the members of the commission.

The statistical data necessary for the July report are being tabulated rapidly and will be in final form within the next few days. The commission was in no position to make any deductions from the statistics on Friday. They still "point in all directions," Dr. Smith said.

Whether or not the separate branches of the coal industry are through throwing mud at each other, the commission is confident that it is to receive the constructive suggestions which each interest has promised. The railroads have submitted a statement which Chairman Hammond described as "constructive." At the press conference there was some discussion of a suggestion by Commissioner Potter of the Interstate Commerce Commission that the railroads be prepared at any time to furnish the cars necessary to transport 15,000,000 tons a week. Apparently Commissioners Hammond and Smith were not prepared to accept the practicability of such a plan.

Chairman Hammond reiterated his former statement that the commission probably will recommend a reduction in the freight rates on anthracite, but coupled with it a warning that a long period necessarily must ensue before any reduction could be put into effect, and even then the recommendation might not be followed. For these reasons he expressed the hope that the public would not be influenced to delay purchases of coal on the prospect of benefiting from a lower freight rate. Dr. Smith called attention to the fact that those who withheld purchases of coal when the bituminous rate reduction was under consideration were penalized heavily for so doing, since they had to pay much more for their coal after the reduction went into effect than would have been the case had they bought earlier. The man who fails to buy his coal early is likely to find himself in a predicament similar to that described in a Mother Goose rhyme which Dr. Smith paraphrases as follows:

This little pig went to market,
This little pig stayed at home,
This little pig got his winter's fuel.
This little pig got none.

Midwestern Retailers Disapprove of Trade Commission's Sanction of "Snowbirding"

Certain Middle Western retail coal interests are not at all hesitant about telling Herbert Hoover why the people of that region are not storing coal, as Secretary Hoover has urged. One of the reasons is interference in industry by the Federal Trade Commission, especially the commission's efforts to compel wholesale coal concerns like the Northwest docks to sell coal to "snowbirds." The Midwest Retail Coal Association, comprising many dealers in Missouri and Iowa, expresses itself to Mr. Hoover thus in a letter from E. J. Wallace, commissioner of the association:

"Acknowledging your circular letter of the 11th and your further letter of the 17th, will say that this association is doing everything possible to encourage dealers in the early storage and delivery of coal to their customers. Our efforts, however, are being stopped, our business is being ruined, by the unfair activities of the Federal Trade Commission.

"The commission insists that everyone has a right to buy coal and if people with no equipment and no bins can buy coal at the same price that merchants can who are put to the expense of storing coal, what encouragement is there to these dealers to store? The Federal Trade Commission tells us that we have no right to do anything to prevent anyone from buying coal and our dealers feel that the so-called clubbing together of coal is unfair competition, and the encouragement of this unfair competition by the Federal Trade Commission is going to cause the retail coal business to break down.

"I refer you in particular to some of the points filed in complaints by the Federal Trade Commission against the Northwestern Dock Shippers Association of Minneapolis. However, we are doing our best to get our dealers to stock, but when dealers won't store for the reasons given above, the ultimate consumer feels that he should not be in a hurry to do it."

Wadleigh Plans Encyclopedia of Standards And Specifications for Commodities

Specifications and standards to apply to all commodities moving in interstate or foreign commerce will be discussed at a conference to be held at the Department of Commerce on June 11. F. R. Wadleigh is in charge of the arrangements being made for the conference. Mr. Wadleigh is planning the issuance of an encyclopedia of specifications and standards. He believes it is possible to apply to most commodities the same principle which is working out so well in the simplification of specifications and standards for the commodities purchased by the government.

Shipping Board Opens Bunker Bids

Bids opened on May 31 by the U. S. Shipping Board at New York for furnishing bunker coal in quantities as required alongside vessels operated by the United States Lines at the Port of New York resulted in tenders ranging on a basis of $3.08@$4.55 per net at the mine.

The specifications called for coal from mine or mines heretofore classified as Pool 1, Pennsylvania or West Virginia, or coal under Navy Acceptable and supplementary lists, to be delivered alongside vessels in New York harbor as required. Bids were asked for six months and for one year. No specific tonnage was named but the successful bidder will not be required except with his consent to deliver in any one month in excess of 15,000 gross tons, the estimated maximum requirements. Bidders and prices received were as follows:

Cosgrove & Co., first six months, $6.50 per gross ton, f.a.s.; second six months, $7.06 per gross ton, f.a.s.

H. B. W. Haff, 75,000 gross tons, six months or one year, $7.35.

Penn Fuel Co., six months, $6.74; one year, $6.99.

W. A. Marshall & Co., 7,700 gross tons monthly for six months, $8.13; 6,000 gross tons monthly for year, $8.13, and 8,000 gross tons monthly for six months or one year, $7.40.

J. H. Weaver & Co., six months or one year, $7.20.

Steamship Fuel Corp., Pool 71, for one year, $7.34.

Seiler Coal Co., Pool 1, for six months or one year, $6.92.

Berwind-White Coal Mining Co., for six months or one year, $7.25.

Coleman & Co., 30,000 gross tons, for six months delivery, $7.52.

Roads Tell Governor Davis They Will Not Make Low Summer Rates on Kansas Coal

After the failure of Governor Davis' recent conference with coal operators, dealers, miners and railroads, dedicated to reopening the Kansas mines, some optimists maintained that the railroads still might be induced to establish emergency summer rates that would make possible a reduction in the price of coal, and thus encourage an increase in demand. The Governor put the question to the railroads. And the other day they answered him with a most emphatic no.

The railroad's statement was to the effect that "Kansas coal cannot be successfully stored; that to establish emergency freight rates in Kansas only would constitute undue tariff discrimination; that any reduction in freight rates would not cut the price of coal sufficiently to induce consumers to store coal during the summer, especially in view of the known fire hazard and the coal's inclination to slack, and finally that other fields are suffering as much as Kansas from an abnormally light summer demand."

Wadleigh Urges Householders to Lay in Coal Before Sept. 1

In a statement issued June 4, F. R. Wadleigh, Federal Distributor, reviews the efforts of national and state trade associations, public utilities and railroads to effect storage of coal for winter consumption between now and Sept. 1. The suggestion is made to the business man and the householder that they obtain their winter coal when it can be easily handled, and as an added precaution against transportation difficulties at a later date.

"Reports received," said Mr. Wadleigh, "indicate that many consumers are delaying their purchases of coal in the belief that the work of the U. S. Coal Commission will result in reductions in prices. While constructive recommendations based on an immense collection of data undoubtedly will be made in the report of the Coal Commission, it is pointed out that no legislative action can be taken until Congress meets in December.

"Considering the general situation today, and in view of the positive recommendations made by the Secretary of Commerce and the great national trade, transportation and public-utility bodies, it is difficult to see how the consumer with ordinary prudence and foresight can avoid following the advice given, that his winter supply of coal, whether for domestic or industrial use, be purchased and stored during the summer months."

Captain Samuel Hines Is Dead

Captain Samuel Hines, long and prominently identified with affairs in the anthracite industry, died at his home in Scranton, Pa., June 3, after a lingering illness. He was in his seventy-ninth year.

Captain Hines was born in Washington, D. C., July 21, 1843, and received his early education at the Washington Seminary and Union Academy.

During the Civil War he enlisted in the Union cause and was assigned to a position in the quartermaster's department as assistant to Captain H. B. Blood, with the armies operating against Richmond, Va.

Continuing in the service until the close of the war, Captain Hines accompanied Captain Blood to Mercer County, Pa., and located valuable deposits of coal in that section. Captain Hines supervised the construction of a breaker, built houses for miners and was the founder of the borough of Stoneboro, which he named after Amisa Stone. He organized and became the paymaster and general agent of the Mercer Coal & Iron Co.

In 1873 he went to Scranton to accept a position as general manager of the Hillside Coal & Iron Co. He figured prominently in the development of the coal industry of the section in and about what is now Forest City. The borough was named by Captain Hines.

After leaving the Hillside Coal & Iron Co. Captain Hines was associated with Dr. B. H. Throop and had charge of the development of the Borough of Throop. He also represented the firm of Price, Pancoast, Parker & Throop at Throop. He continued with these interests until falling health caused him to give up active work about five years ago.

Captain Hines married Miss Rose Nolan, of Hamilton, Canada, on Jan. 21, 1867. His wife died on May 21, 1921.

Supreme Court Rules in Coal Cases

In a decision read June 4 by Associate Justice McReynolds, the U. S. Supreme Court established the precedent that the federal government may be sued in a District Court for recovery of just compensation for commodities requisitioned under the war-time Lever Act in cases of direct requisition.

The case at issue was an appeal of the Houston Coal Co. from a decision of a District Court that it was without jurisdiction to try a suit for the recovery of additional compensation, under Section 10 of the Lever Act. The Navy Department had requisitioned coal from the Houston company, paying $4 per ton, the price fixed by the President under the Lever Act. The company filed suit in the District Court for the recovery of just compensation, which it alleged to be the difference between $4 per ton and the prevailing market price.

In a brief decision, the Supreme Court declared that the District Court did have such jurisdiction and that suit for direct requisition may be instituted in District Courts without the necessity of filing a claim with the Court of Claims.

In the case of Willard, Sutherland & Co. against the United States, appealed from the Court of Claims, the Supreme Court, in an opinion by Associate Justice Butler, affirmed the decision of the Court of Claims that the company has no cause for recovery from the United States. The company contended that the Navy Department in 1917 ordered it to deliver coal at $2.80 per ton in an amount exceeding its contract quality, and filed a claim for $3.65 per ton additional for this excess. The Supreme Court held that the contract was non-enforceable, because of lack of equity, but that because the company had complied with the department's demands, and delivered the coal, it could not recover. A similar decision was rendered in the case of Wm. C. Atwater & Co., Inc., against the United States, a claim caused by Navy coal orders on the same grounds as in the Willard case.

Sensational Testimony in West Virginia Injunction Case; Postponed to Oct. 1

The most startling development at the opening of the second week of the hearings before Judge George W. McClintic in connection with the twelve injunction suits brought against the United Mine Workers by approximately forty-five mine owners in West Virginia was the testimony of the Rev. J. E. Wilburn, mountaineer preacher of Blair, W. Va., now under sentence of eleven years in the penitentiary for his part in the slaying of John Gore, Logan County deputy sheriff, incidental to the armed march of 1921. The witness said on the stand that his lips had been sealed when he was on the witness stand at Charles Town last summer by the injunction of union officials not to "tell more than he had to" with an accompanying threat that "he would be killed on the witness stand."

Wilburn also testified that "when the armed men began to come to Blair, I saw Blizzard, Aug. 26, in an auto which stopped at the school house. There were 15 or 20 rifles in his car. Some 400 men were assembled. I saw him again Aug. 30 when he came in an auto. He had about 25 guns and ammunition. It was stored in my house, in my parlor. There were about 300 to 400 lb. of ammunition. It was distributed among the men."

Will Swanner, a son of J. W. Swanner, killed at Pomeroy, Ohio, told of the advice of a union official to union miners to get their "walking sticks" and he asserted that Fred Mooney, secretary of District 17, had given such advice in a speech at Clothier. The witness added that "walking sticks" were high-powered rifles.

H. W. Dawson, of Gallagher, in telling the story of the machine gun stolen from the railroad station at Pax during the trouble at Willis Branch and of its use in the fighting in Logan County, related a conversation he had with C. F. Keeney, president of District 17, in which the latter had said that the union had tried to settle the trouble in the industrial courts but had failed and now must settle it on the battlefield.

The plaintiffs in the injunction cases closed their presentation of evidence on May 29 after testifying that under the check-off system mine owners had to check-off the pay of non-union men as well as union men and also after introducing evidence of alleged union terrorism to support their contention that a permanent injunction should be granted in order to prevent further violence.

The last witness for the plaintiffs, D. H. Morton, of the American Eagle Collieries Co. and the Leevale Coal Co., stated that while he was associated with the Imperial Collieries Co. at Burnwell, the union had upon one occasion called a strike to prevent the union men from working with two non-union men. He also testified that it had been necessary to check-off for non-union men as well as union men and that if the non-union miners objected, they did not remain long in the locality.

After the miners' union had completed the introduction of testimony and had rested their case on May 31, it was decided by agreement between counsel to postpone arguments until Oct. 1, or until such a time as the record in the case might be printed. Although a number of witnesses were called upon to testify by the defense on May 31, including Samuel B. Montgomery, former Commissioner of Labor of West Virginia and the candidate of the United Mine Workers for Governor in 1920, such testimony was ruled out by Judge McClintic as irrelevant and improper. It will appear in the record as "avowal" testimony.

In ruling on the admissability of the testimony of Montgomery and others Judge McClintic said, "I don't think a judge is supposed to forget all he knows. I know that Mr. Montgomery was not in this armed march and I think it is going far afield to have him testify to the 'why' of it from what he has heard from his many friends in his extensive travels. I think though, it would be safe to say too, that the coal operators of Logan are hostile to the union and also that they have the right to say who shall or shall not come upon their property. We still hold in this state that a man has a right to guard his property and I hope that the law is never changed.

"This case comes under the heading of contracts. It is a question of outside influence. It is a question of taking a check-off to be spent for alleged illegal purposes. It is utterly out of the question to go into alleged illegal acts of officials to try and justify alleged acts of the United Mine Workers of America. In my opinion there was no justification in any form for these other illegal acts. The plaintiffs have alleged certain things. If the officers of the district, or those who knew what was in the minds of the officers, will testify, they may come up."

Brophy Alleges Violation of Civil Rights of Coal Miners in Pennsylvania

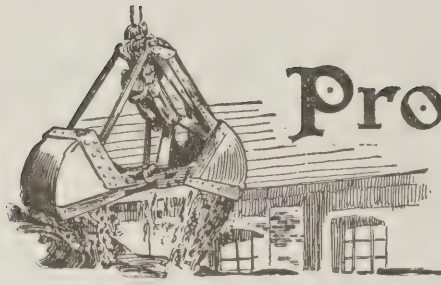
In a letter to the U. S. Coal Commission made public June 3 John Brophy, president of District 2, United Mine Workers, states that the civil liberties of coal miners have been violated in central and western Pennsylvania. Declaring he would give "typical cases of wrongs inflicted," Mr. Brophy asserted that the injuries suffered by miners and their families "are to be traced to the control exercised by a small group of coal operators not only over the work of their employees but also over the town where their properties are located, a monopolistic control over civic, political and human rights."

"The control exercised in non-union mining communities," said Mr. Brophy, "is not possible in any other kind of town. The company owns the houses and can throw you out if they disapprove of any of your actions. In some instances the company owns only the land upon which the miners erect their houses, of course the miners paying a ground rent. In case the owner of the building displeases the company in any way he is asked to remove his house."

"In many non-union towns the streets and roads and places of assembly are company owned and if the company disapproves of a person he is thrown out. . . . The company owns the doctor and the hospital, the store and the houses and the public road, the cemetery and the newspaper, and even the public post office.

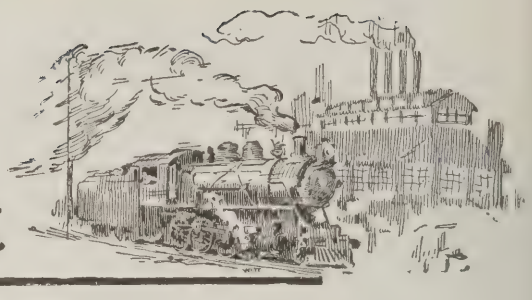
"Operators of non-union mines not only reduce wages at any time they wish, but they even reduce wages without telling the men that they have done so. To illustrate—the wages of the miners of the Consolidated Coal Co., at Gray, Pa., were reduced in August, 1921, and they were not told that their wages had been cut. The company did not even post notices. The first the men knew about it was when they came to get their pay two weeks later. At this time instead of getting the pay they expected, they found their wages had been reduced from 34 to 50 per cent. Such examples could of course be multipled, but I cite this as a typical case of how miners are dealt with in non-union fields.

"We therefore ask that your body will recommend such action as will end the autocratic control now exercised by non-union coal operators to prevent their employees from joining labor unions and enjoying such other liberties as are guaranteed by the Constitution of the United States."



Open Bids on Coal for Ellis Island

For delivering alongside pier at Ellis Island during the year June 1, 1923, to May 31, 1924, from 12,000 to 15,000 gross tons of No. 1 buckwheat and 2,500 gross tons pea coal the following bids were received on May 31:



Martin F. Shea, buckwheat, $5.73; pea coal, $9.49. V. H. Youngman & Co., buckwheat, $5.70; pea coal, $8.95. Sealer Coal Co., buckwheat, $6.07; pea coal, $10.07. H. B. W. Haff, buckwheat, $5.87; pea coal, $8.82; Weston Dodson & Co., buckwheat, $7.05; pea coal, $10.05.

Based upon mine prices the bids for furnishing buckwheat coal ranged from $3.18 to $4.53 and the pea coal from $6.30 to $7.55 per gross ton.

THE INTERSTATE COMMERCE COMMISSION announces that further hearings on the proposed consolidation of railroads —Docket 12964—will be held before Commissioner Hall and Examiner Healey at Chicago, June 18; Buffalo, N. Y., June 21; Philadelphia, June 22; New York City, June 25.

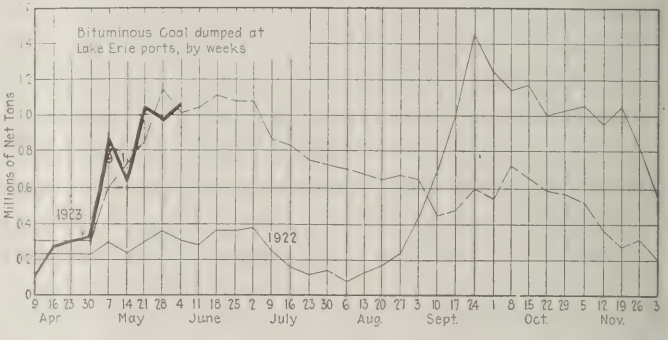
Production and the Market

Weekly Review

Spot prices for soft coal continue to decline. Inquiries, however, are on the increase and a slightly better demand is found in some markets. Production in the week ended June 2 passed 11,000,000 tons, an increase of more than three-quarter million tons over the previous week. Anthracite production dropped below the current rate of 2,000,000 tons per week. Falling prices continue to force more soft-coal mines to close. Kentucky operators are cutting wages to meet the selling figures. Better car supply is reported from nearly all sections.

Production of soft coal for the first 125 days of 1923 was 221,048,000 net tons, larger than during any corresponding period of the past six years, with the exception of 1918, when it was 223,337,000 tons.

Pocahontas, Cambria, Somerset, southern Illinois, Standard and Hocking coals show advances in prices while there are decreases in Indiana, fourth and fifth veins, Pittsburgh, Kanawha and eastern Kentucky coals. *Coal Age* Index of spot prices of soft coal registered 215 on June 4, a decrease of two points, with an average price of $2.60.

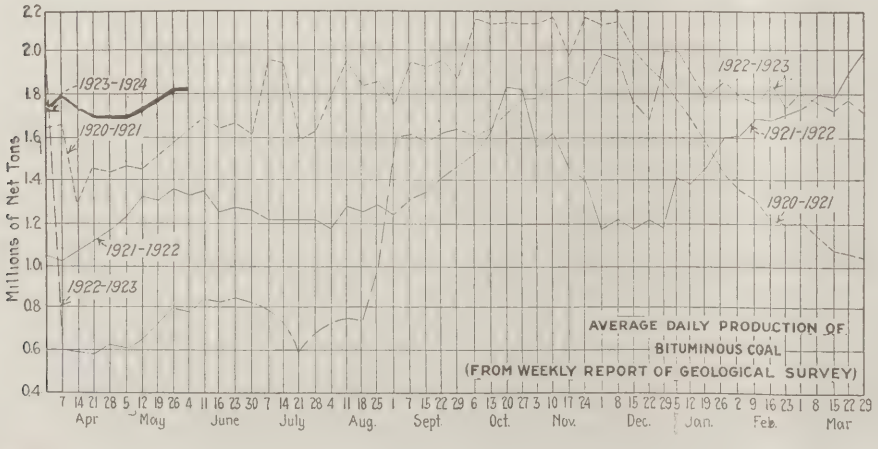


Shipping Board Bids Show Effort at Stiffening

Bids submitted to the U. S. Shipping Board at New York on May 31 for supplying Pool 1 or equivalent coal requirements of the Shipping Board vessels at that port for the year ended May 31, 1924, which ranged from $3.08 to $4.55 per net ton at the mine, indicate an effort to stiffen the market.

In the Middle West trade is quiet. A slight decrease in production followed the June 1 price schedule on domestic sizes in southern Illinois. The trade in New England has been affected by the quiet state of the textile industry. There are a few inquiries for coal for export, mostly for South America, and some chartering is reported. Baltimore reports heavy foreign shipments during the fourth week in May, loadings in the first twenty days of the last month having been 303,129 tons of cargo and bunker coal and 55,845 tons of coke.

Lake shipments are slowly increasing in volume. Up to May 28 approximately 1,400,000 tons of soft coal and 200,000 tons of anthracite had been unloaded at the Head-of-the-Lakes. Shipments of anthracite from Buffalo last week amounted to 72,600 net tons.



"The total soft coal raised during the week ended May 26 (including coal coked, lignite, and mine fuel), is estimated at 11,046,000 net tons," says the Geological Survey report. "This is a gain of 776,000 tons over the revised estimate for the week preceding. Early returns on car loadings during the week May 28-June 2 show 39,688 cars on Monday, and 33,826 cars on Tuesday, which are larger numbers than loaded on the same days

of the previous week. Loadings on Wednesday (Memorial Day) fell to 10,620 tons, and it appears that the holiday amounted to approximately one-third of a normal day. On this basis the average daily loadings for the present week are forecast at about the same level as last week. The present rate of soft-coal production is high and has been exceeded at this season only under war stimulation in 1918."

Dumpings at Hampton Roads for all accounts during the week ended May 31 was 331,725 net tons, as compared with 361,434 net tons the previous week.

Active demand for domestic sizes of anthracite con-

tinues. Consumers are more concerned in the outlook for a continuation of operations after Aug. 31, when the present wage agreement expires. Because of this they are more anxious to obtain their winter coal than in previous summers. Quotations for independent stove and egg sizes are stronger in some sections than for chestnut.

No Midwest Awakening Yet

Coal trade in Chicago and throughout the Midwestern region remains quiet. The circular on Franklin County prepared coal has gone up from $4.10 to $4.35 and there is little buying. This naturally decreases the volume of screenings available, with a slight firming up of the price on those small sizes. Stocking is still confined to a few railroads and steam-coal consumption is only large enough to take the available screenings at low prices. Western Kentucky screenings are reaching Chicago at $1.40 and $1.50 and mine-run at less than $1.75. These coals cover a good deal of the immediate steam demand. Kentucky lump is going into the Northwest rail trade to a considerable extent, gaining business merely on a price basis.

A little better flow of smokeless into the middle West has been noticeable for a week or two. Dealers show some interest in getting it but there is no noticeable rise in price. Anthracite movement grows apace. Consumers are buying earlier this summer, for no further reductions in retail quotaions are expected. Stove is now bringing $16.25 in Chicago; chestnut, $16.10 and pea, $13.50.

In the southern Illinois fields railroad tonnage is light, helping to keep production down. Only three mines in the Du Quoin and Jackson County fields have been getting as much as three days a week.

A retail advance of 25c. a ton June 1 has reminded St. Louis people that the time to put in coal is now. A few are obeying the impulse and are putting in a little coal of the better grades. The country around St. Louis shows no demand for anything. It is noted that a good deal of coal from the St. Louis region is moving into the Northwest, taking some of the low-priced business to be had there.

Kentucky Trade Is Fair at Low Prices

While demand in western Kentucky is a little slow some of the operators admit that it is quite good for this season. But some operators are not quoting screenings in the

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 215, Week of June 4, 1923. Average spot price for same period $2.60. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

Louisville and some other markets, asserting that they would rather close down than sell at $1.25@$1.50 a ton. It is admitted that the screenings market is weak, and will be still weaker when eastern Kentucky screenings reach the bottom, which is expected within the next six weeks, if there is a heavy movement of prepared sizes to the Lake regions.

It is reported that the Illinois Central R.R. is buying a considerable amount of big lump and block coal for storage, figuring that such coal will not slack as badly as mine-run. Practically all small or wagon mines in western Kentucky are down. Better and more uniform grades of coal are reaching the market as a result.

Northwest Has Plenty of Coal

The Northwest evidently is the place to sell coal just now. Rail shippers are all trying their best to get a strangle hold on the available business and the docks continue to receive a heavy stream of fuel by vessel and to vie for trade by making prices attractive. The result is more business is being done in Minnesota, upper Michigan and in Wisconsin than anywhere else. There is even a threat that coal will be shipped into that region from fields that never before sold much of their output there—Arkansas, notably.

West Still Marks Time

Around Kansas City there is little doing in coal. However, an advance of 50c. on Arkansas semi-anthracite served to remind the public that coal is about as low now as it ever will be. Kansas coals remained at the old circular.

In Salt Lake City business is poor. Summer is on in earnest with a consequent slump in all retail business. Even the little day-to-day business that kept the market alive during the past few weeks has disappeared. Operators deny that there will be any further drop in prices. Utah lump now retails at $9 and nut at $8. The busiest mines are getting only about two days running time a week.

In Colorado lignite advanced 25c. June 1, making lump $3@$4, mine-run, $2.50 and slack, $1.65@$1.80. Colorado bituminous lump sells for $5.25; nut, $4.75; mine-run, $4.25 and slack is in demand for steam purposes at $3. The coal business generally has shown a little sign of picking up.

Quietude Pervades Ohio Market

In Ohio the situation is quiet. The smokeless market at Cincinnati holds steady. Retail conditions are excellent, one estimate being that there was treble the business done last month as against May of last year and double that of May in the preceding year. At Columbus the steam trade is showing the biggest slump, while the domestic trade is not at all active. All steam grades are weak and low prices are often quoted in order to dispose of distress cargoes. Steam users whose contracts expired on April 1 have been slow to renew them, believing they will be able to buy in the open market at low figures. Domestic trade is active in the fancy grades of Pocahontas and other smokeless coals.

During the week ended May 26 production in the eastern Ohio district was 424,000 tons, 55,000 tons more than in the preceding week, and the high record tonnage for the present year. Railroad fuel and lake shipments provide the main outlet for eastern Ohio coal at this time. Steam consumers continue to supply their wants in the open market. The retail trade is quiet, although domestic consumers are laying in at least a part of their winter coal now.

Quotations at Cincinnati on June 4 for West Virginia 2-in. lump were $2.75@$3 and for southeastern Kentucky 2-in. lump $2.60@$3, as compared with $3@$3.50 for both coals last week.

Slightly increased output in the Pittsburgh district is attributed to heavier movement in the Lake trade, while the steel industry continues to run at record rate. There is sharp competition in Lake coal and close prices are being made, buyers being in the mood to drive bargains. Lake coal in prompt lots is generally quotable at $2.40@$2.60, this being for three-quarters steam.

Little Change in New England Market

In New England the market shows little change from a week ago. The Pennsylvania grades still have the call on what scattering purchases are made, and while firmer prices were anticipated they have not yet materialized. Apparently there is as much medium to good grade steam coal offering from central Pennsylvania as a month ago, although a few specialties are sold up for 30-day periods. Even in the few cases where operations are well supplied with spot business there are disappointing variations in output that make it difficult to forecast production a month ahead. In general the market is somewhat affected by the quiet state of the textile industry.

Due to transportation difficulties on certain of the routes all rail there is continued heavy movement of both high and low volatiles via the Philadelphia and New York piers. The Philadelphia & Reading Ry. is especially loaded with spot bituminous tonnage, and to such extent is this true that barges released by the light movement of anthracite are being diverted into the soft-coal trade. The tonnage dumped during June doubtless will run into unusually high figures.

At present quotations Cambria coals can be laid down at so many New England points at 50c.@$1 less than Pocahontas and New River that cargoes of the latter for distribution inland have been growing infrequent. Prices are

nominally $8@$8.25 per gross ton on cars Boston, Providence and Portland, but it is expected that when low-cost cargoes begin to arrive there will be a material reduction in this figure. A reasonably good tonnage that last year was obtained by the Southern agencies has this year been supplied from central Pennsylvania, and unless a marked reduction in asking prices of smokeless coals is made soon there will be only light business left for Hampton Roads shippers.

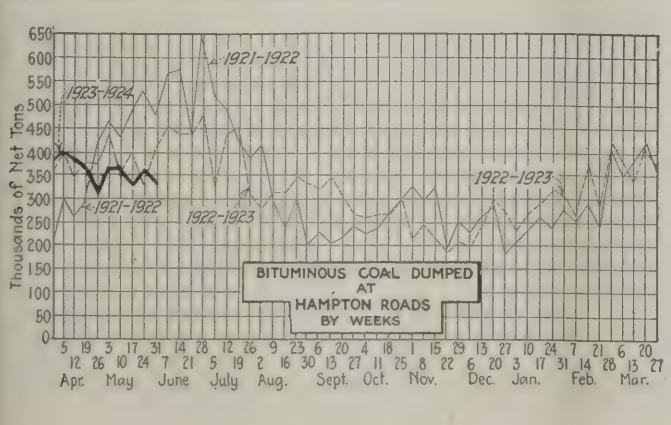
At Norfolk and Newport News spot coal continues to accumulate. Lack of market is now the acknowledged reason, and neither the export nor the New England market is counted upon for much assistance the next 30 days. Prices are nominal; while $6.25@$6.50 is the level quoted it is known that desirable coals can be bought at 25c.@50c. less. Car service has improved materially, and instances of less than 50 per cent output can no longer fairly be attributed wholly to transportation disability.

Slight Improvement at New York

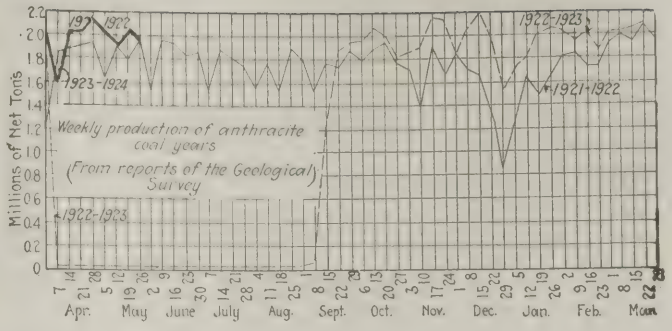
Accumulations at the New York tidewater piers on June 1 were 2,171 cars, as compared with 2,297 cars the week previous. Demand was slow but some shippers were able to see a slight improvement. The better grades were scarce. At Philadelphia there were signs of betterment, the situation there as well as at New York having been helped materially by the Lake trade and larger shipments into New England. Open-market buying prevails at Baltimore. There is plenty of coal, due to heavy output and good car supply.

Western markets and the Lakes have been getting most of the coal produced in the Pocahontas and Tug River fields during the past few weeks, but with better car supply more of smokeless mine-run is now going to tidewater.

There is scarcely any demand for steam coal in the spot market at Birmingham. Bunker business is light. Domestic business is ample to absorb production of this class of coal.



Lake Business Nears Full Speed



The lake season is nearly in full swing. Shipments are almost normal, 156 cargoes having been unloaded at the Head-of-the-Lakes up to May 28, fifty-six of these during the week ended May 26. Receipts at Milwaukee also have been heavy but outgo from the docks has been light, due to slow buying of dock fuel. Contracting for lake shipment in the Columbus market is not active, but loadings and movement is generally good.

Lake dumpings for the week ended June 4 was 1,049,763 net tons of cargo coal and 51,456 net tons of fuel coal, as compared with 884,538 net tons cargo coal and 45,661 net tons fuel coal the previous week. Total dumpings for the season is 5,299,364 net tons cargo coal and 237,466 net tons fuel coal.

Anthracite Consumers Ordering Early

Consumers for the most part are making every effort to put their winter supply of domestic anthracite coals in bins before the expiration of the miners' wage agreement, Aug. 31. So far as possible they do not propose to find it necessary to use substitutes, as some of them did last winter. Egg and stove are in heavier demand in the New York market than any of the other sizes. Philadelphia dealers have been unable as yet to make much headway in stocking their yards, except with an occasional accumulation of pea coal.

Shipments to Baltimore have been slow for a week or more and the small surplus in a few yards has been about wiped out. Heavy demand continues at Toronto, retail dealers having plenty of orders on hand to absorb receipts.

"Production of anthracite in the week ended May 26 was 3 per cent less than in the week preceding," says the Geological Survey. "The nine principal carriers of anthracite reported loading 37,394 cars, from which it is estimated that the total output, including mine fuel, local sales and the product of dredges and washeries, was 1,956,000 net tons. The decrease was chiefly due to a low rate of production on Monday, May 21. On the other days of the week the output averaged more than 6,200 cars daily.

"Preliminary reports of car-loadings in the week May 28-June 2 show 5,935 cars on Monday, 6,038 on Tuesday, and none on Wednesday (Memorial Day). On account of the holiday the total output for the week will be much lower than in recent weeks."

Coke Output Again Gains Slightly

Production of beehive coke for the week ended May 26 is estimated by the Geological Survey at 415,000 net tons. This is an increase of 4,000 tons when compared with the previous week's output. Cumulative output of beehive coke for the present year to date is 8,050,000 tons which is 5,360,000 tons ahead of 1922, 4,921,000 tons ahead of 1921, 892,000 tons ahead of 1922, 4,921,000 tons ahead of 1921, 892,000 tons behind 1920, and 332,000 behind 1919.

How the Coal Fields Are Working

Foreign Market And Export News

British Coal Output Nears High Record; Exports Continue Heavy

Coal production in Great Britain during the week ended May 19 was 5,797,000 tons, says a cable to *Coal Age*. This was an increase of 194,000 tons over the previous week's output, and but 28,000 tons below the output for the week of April 21, 5,825,000 tons the record for the post-war period.

Collieries in South Wales are heavily booked for this month and there have been inquiries for the last half of the year.

During the week ended June 2 coal exports were as follows, in tons:

From the Tyne district	7,104
From the Mersey district	6,392
From the South Wales district	19,609

Vice-Consul Albert W. Scott, at Hull, in a report to the Department of Commerce, at Washington, says that during March last, the coal exports from Hull totaled 404,303 tons, as against 174,639 tons in March last year; from Immingham the total was 230,056 tons, against 88,980 tons; from Goole, 153,912 tons, against 96,656 tons; from Grimsby, 56,703 tons, against 31,959 tons.

A newspaper dispatch states that Sir D. R. Llewellyn and H. H. Merritt, South Wales coal operators, are on their way to America to arrange contracts for supplying Welsh anthracite to American and Canadian buyers, and that they may consider the advisability of erecting plants for handling Welsh anthracite in New York, Montreal and Quebec.

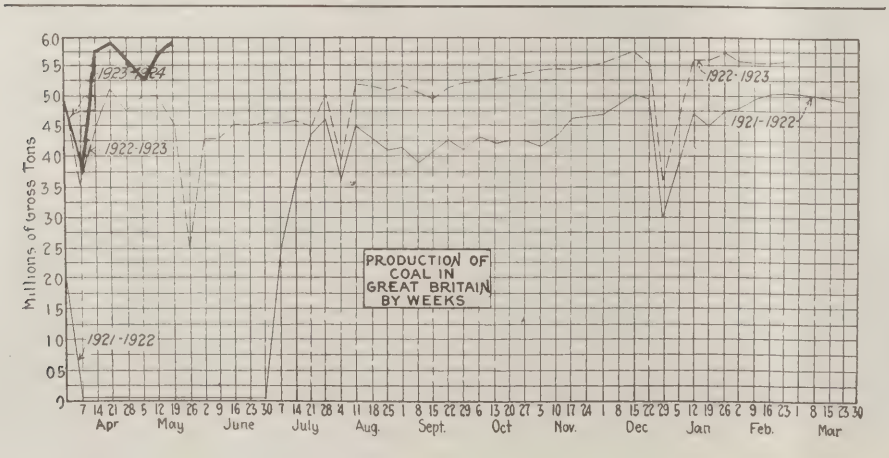
Less Vigor at Hampton Roads

Activities at Hampton Roads lacked vigor last week, dumpings dropped and inquiries slackening. Prices held fairly firm, however, because of diminishing stocks at port.

Export business showed a decrease, while no new contracts for foreign shipments were in prospect. The outlook indicated a further reduction in movement to foreign ports. Coastwise business was slack, and bunkers held fairly regular.

Lack of demand for high volatile coals was one of the features of the market, the price dropping to the lowest level of the year. Heavy movement of the Norwalk & Western and Chesapeake & Ohio by rail to the West cut down the supplies here. The tone of the market was moderately strong.

United States April Coal Exports



(In Gross Tons)

News Items From Field and Trade

ALASKA

The Secretary of the Interior has authorized the **construction of a spur 4½ miles long from the Matanuska branch of the Alaska Railroad to what are known as the Moose Creek coal mines** in the Matanuska field. These mines are said to contain a good quality of steam coal suitable for export and for use on the government railroad.

COLORADO

Colorado produced more coal during the first quarter of this year than during a similar period of 1922. State Coal Mine Inspector Dalrymple's report up to April 1 showed 15 out of 20 coal counties had increased their outputs—notably Las Animas County, with an increase of 282,391 tons. The consolidated report follows:

Counties	Total Tonnage.	Inc.	Dec.
Boulder	247,812	.....	57,785
Delta	26,150	.....	2,093
Elbert	1,850	1,018	.....

Number of days worked per mine	57.5

ILLINOIS

An explosion of powder occurred on the surface of mine No. 14 of the Old Ben Coal Corporation at Buckner recently. The blast happened about 8:10 a.m. and while a number of men were working at different places on top, none was seriously injured. Construction work was going on at the mine at the time and a little damage was done to top buildings. The explosives were stored at the time in a temporary shed near the mouth of the shaft and as no caps or detonators of any kind were near the spot, the cause of the blast remains a mystery.

The U. S. Army made a few small contracts for Middle Western, Ohio, Kansas and Kentucky coal after an opening of bids in Chicago May 22 as follows: Thirteen thousand tons of central Illinois screenings for the Rock Island arsenal from the Penwell Coal Mining Co., of Pana, Ill., $1.75; 1,000 tons of Standard district lump for Fort Snelling, Minn., from the Egyptian Coal & Mining Co., of St. Louis, Mo., $2.42; 877 tons of Pittsburgh No. 8 mine-run for a point in Ohio from the East Coal Co., of Chicago, Ill., $2.25; 305 tons of western Kentucky No. 9 mine-run for Camp Knox, Ky., from the East Coal Co., of Chicago, Ill., $2.08; 400 tons of Hocking mine-run for Fort Hayes, Ohio, from the General Hocking Fuel Co., $2.30; 1,500 tons of Linn County, Kansas, mine-run for Fort Leavenworth, Kan., from the Superior Fuel Co., of Kansas City, Mo., $2.39; 560 tons of Linn County mine-run for Fort Riley, Kan., from the same concern at the same price; 3,000 tons of central Illinois mine-run for the Rock Island arsenal, from the Bickett Coal & Coke Co. of Chicago, $2.65.

George F. Getz, president of the Globe Coal Co., of Chicago, suffered a broken arm, severe scalp wounds and other cuts and bruises May 28 when a woman drove her car into a taxicab in which Mr. Getz was riding.

N. H. Kendall, secretary of the Chicago Coal Merchants Association for several years, has resigned and on June 1 became manager of domestic sales for the Rialto Coal Co., of Chicago.

INDIANA

Reviewing decisions of the Public Service Commission since 1903 to indicate a depressed character of exsting intrastate freight rates on coal in Indiana, **representatives of the railroads have brought the coal-rate fight to a close.** They attacked in every way the contention of the Indiana State Chamber of Commerce and manufacturers throughout the state that the rates from Indiana mines to points within the state are lower than interstate rates and therefore discriminatory. Members of the commission will review transcripts of the evidence on both sides of the question which has been presented during the four days and base their ruling on it. If all pleas of the State Chamber and the various industries for a statewide readjustment are granted, an average reduction of 10 per cent will be made. If the arguments of railroad attorneys are upheld the rates will remain unchanged. Guernsey Orcutt, of Pittsburgh, and L. P. Day, of Chicago, representing all the railroads serving Indiana, presented evidence at the close of the hearing to show that the railroads buy enormous quantities of coal and supplies in Indiana and that those roads whose traffic consists chiefly of coal transportation are operating at a deficit. They endeavored to show that intrastate rates are reasonable and that the advantage lies with the Indiana producers rather than with Illinois, Ohio, Kentucky and West Virginia mine operators, who the State Chamber declared profited by the difference in rates. "The carriers view with apprehension a demand at this time for reduced coal rates in Indiana because those rates did not bear the full measure of past advances applied to rates in other states," Mr. Orcutt said. "Also labor organizations are now agitating further advances in wages and the present rates cannot be said to be reasonably compensatory to the carriers." R. B. Coapstick, traffic manager and attorney for the State Chamber of Commerce, closed his evidence after introducing testimony of representative industries throughout the state to show the alleged discrimination. The witnesses for the carriers were L. T. Averitt, of the Chicago, Milwaukee & St. Paul; George H. Krummer, of the Chicago & Eastern Illinois; S. C. Matthews, of the Pennsylvania; W. B. Ferguson of the Big Four, and Albert Conner, of the Southern.

Several coal companies operating mines along the Wabash near Terre Haute **are expected soon to pay the State of Indiana for coal they have extracted from beneath the bed of the river.** When the state enjoined the Western Indiana Mining Co., of Terre Haute, a year ago, preventing it from pursuing the usual practice of the region, a controversy started between state and mining companies which is just now reaching a termination. The state has tentatively agreed to small reimbursements and it is expected the amounts will be determined harmoniously at a meeting scheduled to take place in the State Capitol June 12. This means that hereafter the state's right to the coal under the river is recognized. Mining companies interested in the dispute besides the Western Indiana are the Grasselli, Ferguson-Spears, Jackson Hill, Richards & Sons, Miami and Lower Vein.

KENTUCKY

Fire on May 26 at Baskett, eight miles from Henderson, **destroyed the commissary store of the Pittsburg Coal Co.,** a west Kentucky coal producer, the loss being reported at $15,000.

A report from Washington, on May 29, states that Henry Ford interests are planning to build a combination bridge and dam at Ironton, O., crossing the Ohio River into Kentucky, with the idea of carrying an extension of the Detroit, Toledo & Ironton R.R. to Ford's coal lands in eastern Kentucky. It is planned to put in a big power dam, and electrify the D. T. & I., and probably furnish power to company mines as well.

MICHIGAN

Sealed proposals will be opened by the Superintendent of Lighthouses, 340 Post Office Building, Detroit, Mich., 2 p.m., June 12, 1923, **for furnishing coal as required by light vessels and light stations** for the fiscal year ending June 30, 1924, to be delivered at Detroit, Sheboygan, Sault Ste. Marie, Houghton, Hancock and Marquette, Mich., and Duluth, Minn. Information on application.

The Board of Education of Detroit will receive bids until noon, Monday, June 25, for furnishing about 600 tons of stove size anthracite for use during the fiscal year from July 1, 1923, to June 30, 1924.

MINNESOTA

The insurance adjustment on coal belonging to the Pittsburgh & Ashland Coal & Dock Co., which was burned on the docks of the Inland Coal & Dock Co. last winter, has been submitted to the Western Adjustment & Inspection Co. for arbitration and appraisal. The amount claimed is in the neighborhood of $200,000. H. J. Grannis, W. E. Greene and C. C. McElwin have been appointed appraisers. An effort will be made to settle out of court.

NEW JERSEY

Joseph S. Frelinghuysen, former U. S. Senator from New Jersey, announced just before sailing for Europe that upon his return he would devote much time and thought to forwarding the interests of a coal consumers' league, and to "make it a constructive machine by which consumers of coal will be assured a sufficient supply at reasonable prices."

NEW YORK

Burns Brothers reports total income of $1,140,028 available for the various issues of capital stock for the year ended March 31, 1923. After allowing for dividends on both classes of preferred stock, the balance available for the Class A and B common stock was equal to $9.18 a share on the former and $1.18 a share on the latter. In the previous fiscal year the company earned equal to $10.16 a share on the Class A stock and $2.16 a share on the Class B stock. The general balance sheet shows a profit and loss surplus of $9,451,239 on March 31, 1923, against $9,532,553 at the close of the previous fiscal year.

John F. Hylan, Mayor of New York City, on May 28 issued a proclamation advising the public to begin laying in its next winter's coal supply. "There will be no escape from another coal shortage with the approach of winter," he said, "though there may be no coal strike. There is talk of a strike on Aug. 1."

Governor Smith has signed the Downing bill which had passed both houses of the Legislature, appropriating $10,500 for plans and specifications for constructing tipples for coal at Ithaca and Watkins. This measure became chapter 581 of the laws of 1923.

The Socialist Party of America in its convention held in New York City recently, **adopted resolutions demanding the nationalization of coal mines.**

Lehigh Valley Coal Sales Co. has declared a dividend of **$2 per share,** payable July 2 to those stockholders who are holders of full-share certificates of stock registered on the company's books at the close of business on June 14.

OHIO

Charles A. Albright, of the Albright Coal Co., Cleveland, Ohio, has been appointed as the representative of the retail coal trade to serve as a member of Federal Fuel Distributor Wadleigh's advisory committee in connection with the investigation of community storage, distribution, etc.

The Southern Ohio Coal Exchange reports that there were **198,862 tons of coal mined in the southern Ohio field during the week ending May 19** out of a full-time capacity of 751,992 tons. Of the shortage of 553,130 tons, car shortage caused a loss

of 171,068 tons; labor shortage, 7,290 tons; mine disability, 25,795 tons; no market, 348,677 tons. In the eastern Ohio field during the same week a total of about 10,000 cars were loaded as compared with 18,000 ordered, making a production of about 60 per cent.

PENNSYLVANIA

There is not sufficient money to the credit of the State Department of Mines to pay the salaries of the bituminous coal inspectors for the period from May 15 to May 31, the end of the present appropriation period. Joseph J. Walsh, Chief of the Department of Mines, recently asked the Attorney General's Department whether or not any part of the appropriation for the two years beginning June 1, 1923, can be applied to these salary payments. Sterling G. McNees, a special Deputy Attorney General, said it is impossible to answer this question finally at present, as the 1923 appropriation bill has not been passed by the Legislature. If this bill should be passed in the form in which it now is, or even in the form in which it has been passed by other Legislatures, Mr. McNees is of the opinion that no part of the money so appropriated for the next biennium could be used for salaries for inspectors, liability for which was incurred during the present biennium. "Whatever salaries are due until the end of the present biennium must be met from funds appropriated for their payment during this biennium," the opinion read. "If there are not sufficient funds in the appropriation for this biennium the result will be a deficiency, which it seems to me can only be met by the deficiency appropriation."

The Pennsylvania Coal & Coke Corporation and subsidiaries for the four months ended April 30, 1923, **shows net income of $469,612,** after interest, depreciation, etc., but before federal taxes, against $43,176 in the same period of the preceding year. Net income for April was $75,394 against a deficit of $89,797 in the same month of 1922. Gross income for the four months period was $509,394 as compared with $47,559 in the preceding year, while April gross stood at $87,732 against a deficit of $92,514 in April, 1922.

Two of the series of Bidelspacher mine bills were approved by **Governor Pinchot on May 28.** One of these, an amendment to the act of 1903, **increases the fees paid by applicants for certificates of qualifications as mine foremen** and assistant mine foremen in the anthracite mines. The bill as presented included provisions for first- and second-grade certificates for mine foremen in the bituminous mines, but these provisions were eliminated. The law, as amended now provides that before the examination of the applicants for certificates of qualification each applicant shall pay a fee of $2 and each successful applicant shall pay an additional fee of $3 before receiving a certificate. The other Bidelspacher act amends a law of 1911 and it **provides that mine operators shall pay to the Department of Mines the actual cost to the state of the assistant mine foreman's report book,** the mine foreman's daily and weekly record book and the fireboss' daily record book. These books have been furnished at state expense. The new law provides that money received for these books shall be deposited in the State Treasury and added to the funds appropriated for the payment of the salaries and other expenses of the inspectors of coal mines.

Glenbrook colliery, an independent operation, near Shamokin, **was idle ten days** because the company refused to employ two of four men whose services were not needed because of the installation of labor-saving machinery on refuse banks. The four men were notified that their services would not be needed, but the company union officials contended that at least two of the men should be retained. The company officials refused to accede to the demands of the union.

Alexander Howat, of Pittsburg, Kan., deposed president of District No. 14, United Mine Workers, and **Thomas Meyerscough,** of Pittsburgh, Pa., who admits being affiliated with the executive committee of the Workers' Party of America, **were barred recently from addressing an audience** of approximately 500 mine workers in Spencer's field, Dunmore, by Burgess, William G. Payton. The meeting, however, was allowed to go on with Rinaldo Cappelini, deposed Pittston organizer, filling the role of principal speaker. There was no disorder of any kind.

W. L. Connell, of Scranton, chairman of the Anthracite Board of Conciliation, and **George F. Lee,** of the George F. Lee Coal Co., of Wilkes-Barre, sailed for Europe Saturday, June 2.

Governor Pinchot has signed a bill requiring anthracite operators to furnish coal to schools, institutions, churches and municipal buildings at the prevailing market price.

Under the **direction of Chief of Mines Walsh, conferences are now being held in the anthracite region** between the mine inspectors and mine officials. A series of similar conferences will be held in the bituminous region as soon as the anthracite conferences are completed, **for the purpose of lessening casualties and increasing the comfort of the employees.**

Dr. Royal Meeker, Commissioner of Labor and Industry, has stated that **an undetermined number of inspectors will be dropped soon.** While the exact number is being withheld, Dr. Meeker volunteered the information that the cut will result in an annual payroll saving of approximately $80,000. Five inspectors have already been dropped, while others are due for severance from the payroll within the near future, Mr. Meeker said.

Fire of unknown origin May 29 **destroyed the No. 3 breaker of the C. Pardee Brothers & Co.** between Lattimer and Milnesville with a loss estimated at $50,000. The breaker had been ordered torn down with the completion of a new breaker nearby and work had already been started. Material was to have been used in other buildings. The fire threatened other buildings for a time and the Hazleton fire department was called to assist in fighting the blaze.

Governor Pinchot has approved the bill of Representative Post, Washington County, relieving life tenants of land from the payment of taxes on the underlying veins of coal which they have no right to operate. **The new law provides that such coal shall be assessed to and the taxes paid by the owner of the veins of coal.**

Alex Swinski, of Locust street, Scranton, **lost his semi-monthly pay amounting to $101.08** when he sat in with a few strangers recently in a card game in a drinking place, according to a story told the police.

Three thousand miners employed by the P. & R. Coal & Iron Co. near Shamokin, **quit work recently because retail coal sales clerks refused to join the United Mine Workers.** The clerks contended they were confidential employees and not entitled to membership. Colliery union officials have ruled to the contrary.

Application has been made to the U. S. Supreme Court by counsel representing the State of Pennsylvania and the City of Scranton **for a rehearing on the Kohler mine-cave law,** which was declared unconstitutional by that court in December last.

The net income of the Westinghouse Electric & Manufacturing Co. for the year ending March 31, 1923, was $12,263,485, as shown by the company's annual report. The dividend requirements were $6,033,428, so that over twice this amount was earned and more than six million dollars added to the surplus. Gross sales for the year were $125,000,000, which represents an increase of $25,000,000 over the sales of last year. The cash position of the company is a strong one, the current assets totaling over $106,000,000 and the current liabilities less than $17,000,000.

Judge Woolley, of the U. S. Circuit Court of Appeals, at Philadelphia in an opinion May 29 sustained the judgment of Judge C. B. Witmer, of the Middle District Court in the case of the Graff Furnace Co. against the Scranton Coal Co. in which the plaintiff was awarded a verdict of $12,000 for damages alleged to have been caused by the removal of lateral support from the property of the plaintiff.

Two more research fellows will be added next year to the staff of the Mining Department at Carnegie Institute of Technology, Pittsburgh, to continue the important coal-mine investigations now being conducted in co-operation with the U. S. Bureau of Mines. At a meeting of the Advisory Board of coal-mine operators held recently in Pittsburgh, various problems were suggested for research, and two companies agreed to finance the employment of additional research fellows. The Hillman Coal & Coke Co., which will finance the employment of one of the investigators, has recommended work on this problem: "The shooting of coal to produce a larger percentage of lump." The Mine Safety Appliance Co., which also will finance a fellowship, recommended that "the adaptability of gas masks in fighting mine fires" be investigated. The employment of two more investigators increases the staff to six, to be selected by the Co-operative Department of Mining Engineering at Carnegie Tech, and to work under the joint auspices of Carnegie Tech, the Bureau of Mines and the Advisory Board of operators. In June of this year the second year of research work on coal-mining problems will be completed. The investigations at Pittsburgh already have attracted much attention. Among the problems suggested by the operators for attack next year are: continuation of the study of the correlation of coal beds of western Pennsylvania through their microscopic constituents; extension of the study of acid mine waters to the actual tests of various experimental machinery parts in the mines, and mine-car gear and lubrication.

The following coal companies were incorporated recently at Harrisburg: **Maxton Coal Co.,** Philadelphia; mining, manufacturing, buying and selling coal and coal products; capital, $50,000; incorporators, Robert W. Wigton, Philadelphia, treasurer; F. H. Wigton, Philadelphia, and Charles B. Maxwell, Morrisdale. **Tiega Track Coal Co.,** Philadelphia; acquiring coal and coal lands; capital, $25,000; incorporators, Harry F. Foote, Jr., 3311 North 20th street, Philadelphia, treasurer; Edward S. Bureau, Philadelphia, and Edmond W. Bureau, Philadelphia. **Listie-Quemahoning Coal Co.,** Listie, Somerset County; mining coal and manufacturing coke; capital, $200,000; treasurer, E. T. Norton, Connellsville; incorporators, J. L. Kendall, Pittsburgh; W. F. Stauffer and F. L. Brown, Scottdale.

Announcement has been made that **the People's Fuel & Supply Co. and the Foster Coal & Lumber Co.,** both of Red Lion, **will be merged.** The combined coal-land holdings in Huntington, Fulton and Bedford Counties will be more than 1,500 acres. The new company will be capitalized at $150,000. Thirty-nine new steel coal cars were purchased recently.

The C. A. Hughes Coal Co., of Altoona, **has purchased the Mountain Quality Coal Co. mine at Twin Rocks,** and already has been started to make improvements. The new owners will erect a modern tipple and arrangements are now being made to have a siding placed to the mine from the Cambria & Indiana Ry. Homes for the employees will be erected within a short time in the vicinity of Seldersville.

After being associated with the Cambria Steel Co. in Johnstown since 1901 as an expert chemist, **H. A. Hosmer** has announced his retirement from the position **to enter the wholesale coal business.** He will be associated with John Tredennick of Boston, Mass., distributor of large coal tonnages from the coal fields of central Pennsylvania. The Johnstown company will be known as the Standish Coal Co. Mr. Hosmer is a native of Massachusetts.

B. H. Cannon, chairman of the executive committee of the Pittsburgh Coal Operators' Association, announced May 31 that **Richard W. Gardiner has resigned as commissioner of the association.** The committee accepted the resignation and it will go into effect immediately. Mr. Gardiner had been commissioner of the association since 1917, when he succeeded Mr. Morrow.

A coal deal involving $100,000 whereby the **Cosgrove & Meehan Coal Co., of Johnstown, becomes part owner of the Gahagen coal lands** near Cairnbrooke, Somerset County, became effective last week. By this deal the Johnstown company increases its possessions by several hundred acres of coal land, 50 tenement houses and a general store. The former owners were William and Clarence Gahagen, who control the Huskin Run Coal Co. The Cosgrove company owns 300 acres adjoining and expects to increase the output to 5,000 tons daily.

UTAH

Articles of incorporation of the **Utah Central Coal Co.** have been filed with County Clerk L. A. Van Dyke. The capital is $500,000, with shares of the par value of $100 each. The officers and directors are M. S. Browning, president; E. S. Rolapp, vice president; John Browning, secretary and treasurer. The foregoing, with Ribert Y. Gibson and Neil M. Madson, comprise the board of directors. The property of the company is located in Carbon County.

VIRGINIA

Trial of the fifteen suits of the Norfolk & Western Ry. against coal companies with agencies, at Norfolk, for amounts aggregating nearly $500,000 for demurrage charges alleged to be due, **opened last week.** The case of the Pan Handle Coal Co. was

heard in the City Circuit Court, and on its outcome will be based the decision on the fourteen other cases. Judge A. R. Hanckel has taken the argument in this case under advisement. It is the first time in the history of the business at Norfolk that this procedure has been followed, and coal men are deeply interested in the outcome.

WEST VIRGINIA

The Wheeling Coal Co. is about to open a mine in a 400-acre tract in Ohio County near Wheeling, on the Pennsylvania R.R. The tipple will be equipped with a 40-in. conveyor and automatic drop-bottom cars will be used. The organizers and operators of the company are Frank Costanzo, president and general manager; Louis Costanzo, vice-president and assistant manager; T. G. Costanzo, treasurer, and E. J. Arnald, secretary.

Differences between the government and the Orr Mining Co. as to the amount of federal taxes it should pay figured in a suit tried in the U. S. Court for the northern District of West Virginia at Parkersburg late in May, **the government contending that the Orr Coal Mining Co. owed $150,000 on income tax and excess profits** for 1917 and 1918. The coal company contends that it was purchased by the Hudson Coal Co.

WASHINGTON D. C.

Within the next few days **the U. S. Civil Service will announce the opening of a new examination for valuation engineers** for entrance into the civil service and to be assigned to the coal valuation section of the Income Tax Unit in Washington, D. C. Papers may be obtained upon request from the Civil Service Commission, Washington, D. C.

The U. S. Geological Survey announces that during April reports were rendered upon 43 applications for coal-prospecting permits and 24 applications for coal leases in Western states.

Federal Fuel Distributor Wadleigh has addressed a letter to H. R. Heyden, Secretary, National Association of Purchasing Agents, strongly **urging the association and its individual members to store coal to capacty during the next three months**, in order, as he expresses it, that "the country may have on Sept. 1 stocks of coal sufficiently large to assist the transportation interests in handling the greatest volume of traffic in their history," this fall. Such action, Mr. Wadleigh points out, will be not only a help to the railroads, by enabling them to move coal before the peak of their general traffic load arrives, but it will also be a protection and insurance to coal consumers.

WISCONSIN

The City Purchasing Board of Milwaukee has awarded contracts for the delivery of coal to the various city departments as follows: Wisconsin Great Lakes Coal & Dock Co., lump $6.75, screenings $5.60; Youghiogheny & Ohio Coal Co., lump $6.90, screenings $5.22; United Coal & Dock Co., screenings $5.73; Callaway Fuel Co., screenings $5.60.

A joint resolution memoralizing Congress to enact legislation protecting coal consumers by **requiring mine operators to furnish proof of the quality of coal sold** has been introduced in the Legislature of Wisconsin. The resolution sets forth that "during the last year coal operators have sold to the people vast quantities of refuse material claiming the same to be coal."

The Milwaukee-Western Fuel Co. suffered a heavy loss on Sunday, May 20, 1923, when the steel **steamer Edward U. Demmer**, bound from Toledo for Milwaukee with a cargo of 7,200 tons of soft coal **went to the bottom of Lake Huron**, following a collision with the steamer Saturn. Fortunately no lives were lost. The vessel and cargo represent an insurance loss of about $400,000.

CANADA

James McGregor, who has been chief inspector of mines for British Columbia since May 10, 1920, has resigned the position because of ill health. He had been in the service of the department for about 25 years. **The duties of the office were taken over June 1 by George Wilkinson**, who was chief inspector from 1917 to 1920 and resigned to become general superintendent of the Pacific Coast Coal Mines, Ltd. Mr. Wilkinson, has had many years experience as a mine operator and engineer in that province. Prior to becoming chief inspector in 1917 he was manager of the Western Fuel Co.'s reserve mine at Nanaimo. Born in Cumberland, England, May 27, 1875, he was at work in the mines five years before coming to Vancouver Island in 1896. Since then he has been engaged, practically without cessation, in and around the coal and metalliferous mines. His technical qualifications are the highest, as

GEORGE WILKINSON

he holds a first class manager's certificate both in British Columbia and Alberta and is a member of the British Columbia Institute of Engineers. He conducted investigations into the two recent explosions in the No. 4 mine of the Canadian Collieries Co.

It was announced in the House of Commons at Ottawa a few days ago that the **Hoppe coal leases in Alberta had been cancelled.**

The Dominion Fuel Board, appointed last November, with Charles Carnsell, Deputy Minister of Mines, as chairman, to investigate the fuel problem, have issued an interim report making the following recommendations: Wider range of utilization of the coals of British Columbia, Alberta and the Maritime Province; investigation into the feasibility of establishing by-product recovery coking plants in the larger centers of population; utilization of peat to supply a portion of the fuel needs of central Canada, with further encouragement of the industry by the governments concerned, if necessary; utilization of wood resources under proper management to a greater degree than at present. Electric house heating on a large scale is considered impracticable, but it is pointed out that the use of electrictiy for industrial and transportation purposes will set free a large amount of coal for heating. The report concludes with a warning that with the anthracite fields nearing exhaustion the public must look to other sources for fuel.

Obituary

John H. Scott, manager of the Wilkeson Coal & Coke Co. of Tacoma, Wash., died of heart failure in New York City early in May. Mr. Scott was a veteran of the Civil War and had been a coal operator for many years before his death.

William J. McClain, secretary-treasurer of Waldo, Egbert & McClain, Buffalo, N. Y., extensive jobbers in steel, coal and coke, died on May 22, aged 39. He was for several years connected with the Carnegie Steel Co. at Youngstown and later with the Republic Iron & Steel Co., which latter he left to become a member of the present company. He was popular socially and a member of many local organizations. He leaves a wife and child.

Harry P. Mahaffey, aged 45 years, assistant superintendent of the Wilmore Coal Co. and one of the most prominent citizens of Windber, Somerset County, Pa., died May 23 in the Windber hospital. His death was due to influenza and bronchial pneumonia. He was born at McGees Mills, Clearfield County, and received his education at Pennsylvania State College. He was located in Windber for eleven years.

John W. Spickelmier, 67 years old, a pioneer coal dealer and cement block manufacturer of Indianapolis, died recently at his home in that city. Mr. Spickelmier was born Jan. 10, 1856, in Hendricks County, Indiana, and went to Lebanon to live when a young man. He moved to Indianapolis to engage in business many years ago and was founder of the Boulevard Cement Block Co. and the Spickelmier Fuel & Supply Co. The widow, Mrs. Martha Spickelmier, and three daughters survive.

After a brief illness, **Colonel Stuart W. Walker**, of New York and Martinsburg, W. Va., general counsel for the Consolidation Coal Co., expired at his home at Martinsburg on Wednesday, May 23. He had suffered a stroke of paralysis early Monday morning, May 21. Colonel Walker entered the service of the Consolidation Coal Co. two years ago, upon retiring as U. S. Attorney for the Northern District of West Virginia, in which office he had served for two terms under President Wilson. He was a graduate of the law school of Washington and Lee and had been a practicing attorney in Martinsburg until his appointment as counsel for the Consolidation. He had always been active in Democratic politics, at one time opposing the late Judge A. G. Dayton as a candidate for Congress and twice being elected delegate at large to national conventions of his party. He served as assistant district attorney from 1895 until 1897. Colonel Walker is survived by a widow, formerly Miss Annette Thayer of Charleston, and by one brother, Hunter Walker, of Berkeley County. Funeral services were held at his home, "The Pillars," near Martinsburg, on Saturday, May 26, interment being at Martinsburg. The Circuit Court of Berkeley County, in session at Martinsburg, adjourned on May 24 out of respect to his memory.

Association Activities

Pittsburgh Wholesale Coal Associations

M. H. Jacobs, assistant general freight agent of the Western Maryland R.R., addressed the members of the Pittsburgh Wholesale Coal Association at their weekly meeting May 28 on the subject: "The Western Maryland R.R. and Its Relation to the Coal Industry," dealing with the history of the Western Maryland and statistics relative to equipment and tonnage movement as well as describing the coal-producing territory touched by this railroad and reached directly or in conjunction with other railroads. A speakers' committee composed of W. C. MacQuown, Keister-MacQuown Fuel Co.; J. A. Collette, Farrell Fuel Co., and I. W. Brison, Poland Coal Co., was recently appointed by President Frank Howard of the Bellebridge Coal Co. for the purpose of making the meeting more interesting to the members. All attendance records have been broken, and at the present rate it looks as if larger quarters will be necessary to take care of the large number of members and friends attending the meetings.

Traffic News

The Norfolk & Western, it is reported, will undertake further electrification of its lines during June between Farm and Iaeger. When the work is completed it will be possible to use electric motors for a distance of about 60 miles, covering the heaviest grades of the entire system and on that part of the road where much of the coal traffic handled by the road originates. The N. & W. already has about 40 miles of track under electrification, excluding the Bluefield yards and the trackage on Tug River fork.

Announcement has been made of an order recently made by the Mobile & Ohio Railroad Co., for new equipment costing approximately $2,400,000, all to be delivered in time for the heavy traffic rush next fall. Included in the order were 200 50-ton all steel coal cars and they will be built by the American Car & Foundry Co. at St Louis and Memphis. Ten Mikado type freight locomotives were in the order and will be built at Lima, Ohio.

W. H. Truesdale, president of the **D., L. & W. R.R., cites in the annual report of the company a decrease in surplus** for 1922 of $5,304,830.67 when compared with 1921. The loss from revenues amounted to $11,355,471.17 and from expenses $4,200,410.78. The company received $4,699,063.93 from the U. S. Railroad Administration. Due to the strike, earnings of the coal department

show a loss of $6,582,558.23 when compared with 1921, the net income during 1922 amounting to $43,847.21. Dividends declared totaled $10,132,932, or $3,377,644 less than during the previous year. Mr. Truesdale says that during the strike of the hard-coal miners scarcely a ton of coal was produced, with the result that with the reduction in freight rates effective July 1, 1922, the revenues of the company from the transportation of anthracite decreased $12,312,107. The company transported over its lines 21,798,417 tons of freight, or 2,875,385 tons less than in 1921, although the loss in the transportation of anthracite alone was 4,391,721 tons. The cost of fuel for locomotives and floating equipment increased $1,163,391 over the previous year.

A large number of **Kewanee (Ill.) industries have applied for a reduction in freight rates on coal from Peoria and Fulton counties, Ill.**, to that city. It is claimed by Kewanee industries that there is an inequality of rates between Galesburg, Ill., and Kewanee.

As practically all embargoes, prohibiting the movement of coal and coke shipments on or via the **New York Central R.R.** have now been cancelled, the company announces that its **"Summary of Informal Embargo Notices" will be discontinued.**

The Muscatine (Iowa) Shippers Association is investigating freight rates on coal from Illinois mines to that city. It is estimated that 2,000 cars of coal are annually used in Muscatine from Illinois fields. Present rates to Muscatine are higher than to Davenport, Iowa, with the distance favorable to Muscatine.

Attorney-Examiner P. F. Gault, of the I.C.C. has reported, in the **case of the Indiana State Chamber of Commerce vs. The Baltimore & Ohio Railroad Co.** The conclusions are practically as asked for by the complainants—providing decreases of from 8 to 22c.—with the exception of the rates from West Virginia and Kentucky to "gas belt" points where a reduction of 17c. was recommended as against 32c. asked. Exceptions will be filed to this item.

The Coal and Coke Committee, Trunk Line Territory, announces hearings at 143 Liberty Street, New York, commencing on the morning of June 6, 1923, relative to the following subjects: Adjustment of rates on bituminous coal from all originating bituminous coal lines publishing rates to D., L. & W. R.R., Norwich, N. Y., and intermediate territory, Willards to Haynes, N. Y., inclusive, N. Y., O. & W. R.R., Norwich and Oxford, N. Y. The present rate on the Clearfield basis is $2.96 gross ton and the proposed rate $3.09. The usual arbitraries over Clearfield basis from other groups of origin to be maintained. Another subject is the carriers' proposal of cancellation of rates on bituminous and cannel coal as shown in tariff I.C.C. No. 3464 from mines on the Pittsburgh, Shawmut & Northern R.R. to Jamison City, Masten and Powell, Pa. The reason for this change is to remove obsolete rates from the tariff. Another subject for hearing is the cancellation of joint rates on coke from ovens on originating lines to destinations in Nova Scotia, New Brunswick, and northern Maine, except St. John, N. B., West St. John, N. B., Halifax and Sidney, N. S. The reason for this proposal is that the rates are obsolete and there is no movement to points other than those named above. Another subject is adjustment of rates on coke from ovens on the Pennsylvania System and lateral connections to various points on the West Shore R.R. For instance, the present rates from the Gallitzin group to various points such as Ridgeland and Churchville on the West Shore, and Phillipsburg on the Pennsylvania System, are as follows: $3.65 net ton to be increased to $3.76; $3.63 net ton to be increased to $3.76; $3.25 net ton to points on the Pennsylvania to be increased to $3.38, with the usual arbitraries over Gallitzin basis from other groups of origin. The reason for this proposal is to remove the fourth section departures. At the same time and place there will be hearings with reference to the movement on anthracite coal from mines on the N. Y., O. & W. R.R. to New York Central R.R. stations from Schenectady to Rensselaer, N. Y., and the rates on anthracite from the various originating lines to a number of points on the New York Central R.R. Anyone interested in any of these subjects should communicate with Joseph Weed, chairman of the Coal & Coke Committee, at 143 Liberty Street, New York.

The Kentucky Railroad Commission, has handed down a decision for the Elkhorn-Hazard Coal Co. against the Louisville & Nashville R.R. concerning freight rates on bituminous coal from certain mines in the Hazard coal field to destinations in the state. The complaining companies operate mines in the vicinity of Whitesburg and, because their rates were 10c. a ton higher than rates of other operators in the Hazard field, they have practically been excluded from doing business in Kentucky. In giving the complainants the same rates as other Hazard coal mines the commission puts them in position to reach Louisville and other Kentucky cities on a rate equally with Hazard group operators and also those in the Jellico field.

The Baltimore & Ohio R.R. has filed an application with the Interstate Commerce Commission asking authority to abandon a part of the line of that road in the State of Ohio 17 miles long, extending from a point near South Wooster, Wayne County, to Millersburg, Holmes County. The company says the earnings do not justify its continuance, and therefore the move is in the interest of economy.

E. J. Cleave, formerly connected with the Pennsylvania R.R., **has been appointed district manager of the Car Service Division of the American Railway Association n New York** with headquarters at 30 Vesey Street. He assumed his new duties on June 1. The appointment is in line with the policy recently announced by the Car Service Division of establishing district headquarters in certain cities for the purpose of bringing about closer co-operation between shippers and the carriers and to enable the railroads to anticipate as far as possible the transportation needs of the industrial and agricultural districts in various parts of the country. District headquarters have already ben established in Minneapolis, Birmingham, Dallas, St. Louis, Chicago, Cincinnati and Toledo. The territory making up the New York district includes all New York City terminals and practically all of the state, as well as the entire states of New Jersey and Delaware, the eastern shore of Maryland and Virginia and the eastern half of Pennsylvania.

On the ground that it has no jurisdiction, the **Interstate Commerce Commission has dismissed the complaint of the International Harvester Co.**, in which the rates on coal between Farmington and St. David, Ill., to Canton, Ill., were attacked as being unreasonable. Since the rates are not held to be unreasonable in their relation to interstate rates, the commission holds that it has had no jurisdiction over these rates since the termination of federal control.

Reparation has been awarded Tuffli Bros. Pig Iron & Coke Co. because of the application of an unreasonable rate on coke between Benham, Ky., and Abilene, Kan.

Continuance of operation on the part of the Federal Valley Railroad Co. in the Athens region of Ohio is essential to the public interest, it is contended by the United Mine Workers of America, the Black Diamond Co., the Jennings Coal Co., the Federal Creek Coal Co., the Schuler Coal Co. and the Athens Chamber of Commerce in briefs filed with the Interstate Commerce Commission. It is contended that this line serves an area from which large amounts of coal are recoverable. The potential tonnage of that portion of the Pittsburgh vein is said to be more than 200,000. In addition, it is claimed that there are large tonnages available in the Hocking and No. 7 beds. If sufficient equipment is furnished and definite assurance of the continuance of service is given, greatly increased production may be expected from the territory tributary to this line. The interests mentioned are taking no part in the controversy as to what may constitute proper divisions for the Federal Valley line. Their only claim is that the divisions be such as to continue, improve and promote the service now being rendered.

Railroads of the United States, according to the Car Service Division of the American Railway Association, on May 15 **had 50,587 serviceable locomotives**, an increase of 328 over the total number on May 1 this year, which had previously marked the peak. Locomotives in need of repair on May 15 totaled 13,495, or 21 per cent of the number on line. Compared with the number on May 1, this was a decrease of 636. During the semi-monthly period from May 1 to May 15, a total of 16,904 locomotives were repaired and turned out of the shops. This was an increase of 485 over the number repaired during the last half of April. Between May 1 and May 15 this year **the roads installed 5,633 new cars and 308 new locomotives.** This brought the total number of new freight cars installed since Jan. 1 to 55,784, while a total of 1,536 new locomotives have been placed in service during the same period. New freight cars on order on May 15 totaled 113,619. Of that number 45,742 were for coal cars. During the first 15 days in May the carriers placed orders calling for the delivery of 147 new locomotives which brought the total number on order on May 15 to 2,103.

Coming Meetings

Iron and Steel Exposition at Buffalo, N. Y., Sept. 24-28. Association of Iron and Steel Electrical Engineers, Empire Building, Pittsburgh, Pa.

The American Wholesale Coal Association will hold its annual convention June 12 and 13 at the Gibson Hotel, Cincinnati, Ohio. Secretary, G. H. Merryweather, Union Fuel Bldg., Chicago, Ill.

Illinois and Wisconsin Retail Coal Dealers' Association will hold its annual meeting June 12-14 at Delavan, Wisconsin. Secretary, I. L. Runyan, Great Northern Building, Chicago, Ill.

Southwestern Interstate Coal Operators' Association will hold its annual meeting June 12 at Kansas City, Mo. General Commissioner, W. L. A. Johnson, Kansas City, Mo.

New England Coal Dealers' Association will hold its annual meeting at Providence, R. I., June 13-15. Secretary, C. R. Elder, Boston, Mass.

National Retail Coal Merchants' Association will hold its sixth annual convention June 25, 26 and 27 at Scranton, Pa., with headquarters at the Hotel Casey.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will hold its annual convention June 25-29, at Swampscott, Mass. Secretary F. L. Hutchinson, 29 West 39th St., New York City.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

The Electric Power Club's annual meeting will be held at the Homestead, Hot Springs, Va., June 11-14. Executive secretary, S. N. Clarkson, Cleveland, Ohio.

National Coal Association will hold its sixth annual convention June 19-22, at Atlantic City, N. J. Assistant secretary, C. C. Crowe, Washington, D. C.

Retail Coal Dealers' Association of Texas will hold its eighteenth annual convention at Galveston, June 11 and 12. Secretary, C. R. Goldman, Dallas.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting lill start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

West Virginia Coal Mining Institute has set June 12 and 13 for its annual meeting, to be held at Hotel Waldo, Clarksburg, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

The Engineering Section of the **National Safety Council** will hold its second meeting of the year on June 12 in the Board of Commerce Building, Detroit, Mich., in co-operation with the Detroit Safety Council.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, JUNE 14, 1923 Number 24

Meeting the Labor Question Nationally

SIX years ago coal operators from all over the country met for the first time in one assembly. In the autumn of 1917 the National Coal Association was organized and its first year was given wholeheartedly to winning the war. Next week its seventh annual convention will be celebrated at Atlantic City. Much has transpired since the end of the war.

Its war job done, the association early in 1919 turned to the assembly and dissemination of trade facts as one of its chief functions. A federation of local trade bureaus, the National organized a country-wide trade-reporting service that functioned well until the federal government put the ban on open price reporting. Since the strike of 1919 the National Coal Association has been mainly engaged in fighting for the maintenance of the coal business as a private enterprise. Its activities have been more political than economic and it may be said that it has been the recognition of Washington in the scheme of things affecting the coal man that has held the organization together through some trying periods. Incidentally it is apparent that this recognition and consequent interest in and support of the National Coal Association has varied almost directly as the distance from the national capital.

Last year, in the second month of the great strike, labor was boldly admitted as a subject that could be considered by the membership of this association. Distance from Washington—or from Indianapolis, for that matter—does not serve to cool the interest of every coal operator in labor. Everyone has it on his mind; if union, how to get along with the union, and if non-union, how to maintain that status. Thus the subject that is uppermost in the mind of each was no longer banned from the councils of the National Coal Association. True, the severity of the strike and the lack of ability of even the union operators to meet on any common ground prevented the National Coal Association from becoming a factor in the labor situation; in fact precluded it from opening the matter for discussion.

Thus we find at the beginning of its eighth year a national association composed largely of local groups that have as their chief, and in many instances their only, function the handling of labor matters. The labor policy of the national organization as expressed at the convention last year is to recognize and respect the rights and opinions of the locals on labor matters, to interfere in no way with the principle of "district autonomy." Such a policy aims in no way to give direction to thinking or action on labor matters. Its expression helped in no way to solve labor questions and but served to spread on the record what has always been the opinion of the membership.

The sentiment of a majority of the coal operators is still to maintain the National as a defender of the rights of individual action. They are even yet engaged in writing and defending their declaration of independence. Some day, surely, they will think about writing a constitution that will bind them together in progressive movement. It is not to be thought that no one of them has given this matter consideration, for the past year has emphasized to the leaders the necessity of a plan of action that will overcome the handicaps to the industry imposed by an uncemented two-thirds unionized majority and a solid one-third non-union group.

Not once but many times in the past few years has the question been raised, How long will the National Coal Association live? The answer is that it is here to stay. When last year defection of large union groups —Illnois, central Pennsylvania and Iowa and the largest operator in Pittsburgh—reduced the ranks, it seemed that the organization was drifting into the control of the non-union producers. The end in that direction would be fatal to the National, as everyone knows. The tendency has been unduly magnified, however, for the union operators who have remained with the organization have been working steadily toward consolidation of their ranks and the working out of a policy that will reunite the whole. Time for education must be allowed for this accomplishment.

Granted that the main purpose of this association remains the perpetuation of the right of individual enterprise in the coal industry, it were well to recognize that, unsatisfactory labor relations being the chief cause of disturbance and the root trouble, to correct this condition might well become the chief activity of the National. That is to say, correction of the cause of trouble is in the end more constructive than defence against the effects. Nevertheless a defensive alliance has served the useful purpose of holding the ranks together while education has been proceeding on other lines.

This education has advanced sufficiently to warrant the National in stepping forward beyond the mere assertion of the desires of local interest, the preservation of "district autonomy," to a definite alignment that is designed to carry forward that policy. As a program, a common ground for union and non-union operators within the association, a policy of maintaining the *status quo* is sufficient, but for the union operators something more is essential. Within the National if possible, otherwise outside, there is required a grouping of those who must meet the union sufficiently strong, aggressive, cohesive and purposeful to combat a united militant United Mine Workers. Save by the example of their unity of purpose and unity of action the non-union operators can lend the union producers no help in this. The problem is for those who are dealing with organized labor. That is why the well wishers of the National Coal Association, who outnumber the present membership, look forward to the return to active participation of those who are temporarily outside, believing that when a formula has been devised for meeting the labor question unitedly the National Coal Association will be but at the threshold of its greatest usefulness and success.

The Anthracite Market

THERE is a danger signal for the country in the unseasonable strength of the anthracite market. Domestic sizes are in such strong demand that independent quotations, the index of activity, have barely fallen from their winter's peak. In fact, quotations on scattered lots of pea and larger coal recently have set unusual records for this time of the year and the bulk of the independent coal is moving at a differential of a dollar over company coal. Normally April and May are comparatively dull months for the independents; their prices sag and movement declines with the coming of winter and the beginning of a new coal year.

Two things have combined to make this season out of the ordinary, aside from the fact that the city dweller is quite generally in funds and able and willing to buy almost irrespective of price. Probably first and foremost is the fact that the East squirmed its way through last winter on curb-to-furnace deliveries. No surplus of hard coal was at any time possible and bins were empty at the end of a long, cold winter and spring. Retail dealers have sought to replenish their yard supplies and have almost without exception found householders willing if not eager to take in next winter's requirements. The flow from mine to cellar has been uninterrupted.

Overhanging strike clouds are again making apprehensive the householder and particularly the trade. The wage contract between operators and mine workers in the hard-coal region will expire on Aug. 31. Will it be renewed without a suspension? No move is being taken to negotiate a new contract, and none is possible until after the mine workers' tri-district convention which is to meet on June 26 to formulate policy and demands. It is generally expected that the demands of 1922 will be restated, calling for 20 per cent increase in wages and for changes in working conditions that are calculated further to increase the cost of production.

The consumer is convinced in advance that his anthracite is costing too much. He will have no patience with a higher price although the majority of users will pay for a time—but under protest—whatever the price may be. So far has anthracite traveled the road toward the category of luxuries. The producers know the outcry that would follow a jump in price and will contend against the demands of the workers for higher wages.

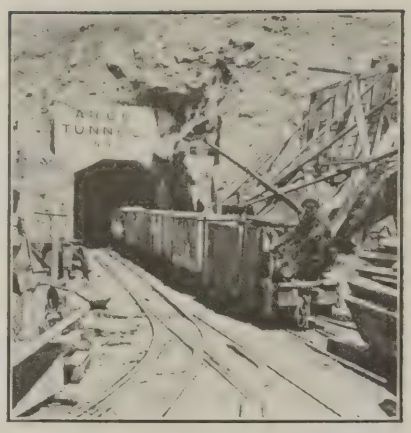
Several unknown factors intervene in estimating the extreme to which the United Mine Workers may go in holding out for the increase it seems assured they will formally demand. One is the strength the radical movement among the workers may develop—that is to say, to what extent a conservative leadership may be able to control the men. Conservative leadership, opposed to nationalization and favoring the well-trodden paths of collective bargaining, may be able to read aright the signs of the times and come to a peaceful understanding with the anthracite operators, one not colored by a concurrent soft-coal settlement. This, we believe, is hoping for a great deal. What the undoubtedly strong radical element, Cappellini on the outside—as yet—and Golden on the inside, may accomplish is another matter. One does not need to be a pessimist to anticipate at least unsettled labor conditions in the anthracite region this year.

Unknown also are the facts about anthracite that the U. S. Coal Commission will release to the public on July 1, the date set by Congress for a special report, it seems in aid of the very situation that is developing. And what effect will the publication of the results of an impartial detailed investigation of the many moot points have on a restive, suspicious public and on operators and mine workers? Will the findings of fact and interpretation of the Coal Commissioners so definitely point the several ways that there will be no gainsaying the ultimate direction of action?

Uncertainty lurks at every turn. Between now and Sept. 1 is less than three months in which to take in anthracite. There is no complaint of the rate at which household coal is pouring into the consumer's cellar, but there is too little heed to the accumulations now, under quite favorable price and market condition, of substitutes. It were well that the advice be discreetly passed to the public that it is taking too many chances if it puts entire trust in getting hard coal easily next winter. Some judicious buying of substitutes in the next few months would be good policy for all.

A Daniels Come to Judgment

FINAL disposition last month by the U. S. Supreme Court of the New River Collieries case sets at rest all doubt as to the legal right of a seller to demand the market price for his coal. Even before the Lever act the Navy Department set its own price for the coal it commandeered or bought and invited the producer to accept that price or fight in the courts. After the government prices were lifted and until early in 1921 the same policy was followed. The test case for the producers was won in the lower courts and now is upheld in the highest court in a unanimous decision that contains a number of interesting and important statements.



The ascertainment of compensation, it is stated, "is a judicial function, and no power exists in any other department of the government to declare what the compensation shall be or to prescribe any binding rule in that regard." That is, whether it be coal or coal mines, the courts will decide what price shall be paid if the government becomes the buyer. "Where private property is taken for public use, and there is a market price prevailing at the time and place of the taking, that price is just compensation." The refusal of lower courts to consider evidence on the owner's cost of production and a reasonable profit was upheld because the "owner's cost, profit or loss did not tend to prove market price or value at the time of taking, and was therefore immaterial."

The distinction was recognized between contract prices under which coal was currently moving in domestic business and the spot market on which the coal commandeered was being sold.

WHEN AS RECENTLY AS JAN. 29 Ellis Searles repudiated the nationalization plan of Brophy and Golden, he pointed out that Brophy's committee was not authorized to present its findings save to the next convention of the U.M.W.A. Brophy, reputed to be after John Lewis' scalp, was thus spanked. Now comes the proposal of the three anthracite district presidents, signed by none less than Ellis Searles, outlining a plan for nationalization of the hard-coal mines. It is now Brophy's turn to point out in Searles' words that "the 1921 convention did not commit the union to any particular form or plan of nationalization."

Coal- and Metal-Mining Methods Contrasted

By D. Harrington
Supervising Mining Engineer, U. S. Bureau of Mines

High Temperatures in Metal Mines—Methane Found in Workings of Both Types—Blasting Timber Causes Fires in Mines Producing Metals—Dust in Such Mines Probably Causes More Deaths Than Coal-Dust Explosions

THE products of the mineral industry of the United States were worth four billions of dollars in 1921 (the latest year for which figures are available), of which coal accounted for one and three-quarter billions and virgin metals for three-quarters of a billion, so a general comparison of practices at coal and metal mines should be instructive.

Natural Conditions.—In general the coal mined in the United States is less than 1,000 ft. below the surface vertically and the mining is all on one plane, usually tilted only slightly from the horizontal, though there are a few coal mines with over 2,000 ft. of cover, and a considerable number with steep pitches or working two or more seams. Metal mines generally work along several practically vertical horizons, and frequently have workings 3,000, 4,000 or even 5,000 ft. below the surface.

In this connection it is noticeable that ladders are only occasionally found in coal mines, and few coal miners are proficient ladder climbers. The natural temperature of surrounding walls or of water encountered in coal mines runs from about 50 to 70 deg. F., with rare instances where the wall temperatures are over 70 deg. and in places will reach as high as 90 deg. F. The natural wall temperatures in metal mines, while generally low near the surface, run as high as 135 deg. in deep workings, and in mines with fires, such temperatures may frequently approach 200 deg. F. Largely owing to the conditions recited, the air temperatures in working places in coal mines rarely rise above 70 deg. F., whereas temperatures of 80, 90 or well over 100 deg. F. frequently are found in the working places of metal mines.

Note—Published by permission of the Director, U. S. Bureau of Mines. These notes are presented as embodying personal impressions of coal and metal mining after twenty-two years of experience and observations wholly in the United States, about fifteen years being spent in coal mining and seven years in connection with metal mining, during which underground work has been done or trips taken into working places in over 150 coal mines in fifteen states of the Union, and in over 100 metal mines in fourteen states. The ground covered included twenty-five states—as far east as Virginia, as far north as Montana, and as far south as Alabama, eleven states being east of the Mississippi. Only two short trips were taken into anthracite mines, hence anthracite conditions are not included. The metal mines visited included those whose chief product was copper, gold, iron, lead, manganese, silver, tungsten or zinc.

The illustrations and captions were added by the editor without consultation with the author.

The headpiece depicts the Argo tunnel. Home-built locomotive, bringing out a load of 3-ton ore cars on a 36-in. gage. These are typical ore cars without flare, of narrow gage and of steel construction. Flare is less necessary where the mineral is heavy and the support of a flare also is more difficult under these circumstances.

Gases Encountered.—Many coal mines are afflicted with methane and occasionally coal mines are troubled with small outflows of nitrogen or sulphuretted hydrogen. In unventilated places, the percentage of oxygen may fall below normal, that gas being absorbed by the coal. Metal mines also occasionally emit methane and in many regions they also are troubled with sulphuretted hydrogen, carbon dioxide, or nitrogen which is emitted by the strata. Frequently, moreover, there is a dangerous oxygen deficiency due to the absorption of that gas by timbers or as the result of the oxidation of ores.

Besides these gases from natural causes may be found carbon monoxide. This occurs both in coal and metal mines, being the outcome of mine fires. Metal-mine fires also give off dangerous quantities of sulphur dioxide, fumes of dilute sulphuric acid, and even arsenical fumes. Moreover, in metal mines the firing of shots loaded with dynamite in confined and poorly ventilated places frequently leaves those places filled with dangerous percentages of carbon monoxide and oxides of nitrogen. Fatal gassing from this source is much more frequent in metal than in coal mining. In fact, metal mines as a whole have a much greater variety of dangerous gases than coal mines.

The coal miner usually is more or less familiar with gases and is disinclined to venture into abandoned workings unless they have been inspected by a fireboss. On the other hand, metal miners—even the men in charge—rarely have much knowledge of the possible pollution of the mine atmosphere, and the belief is general that so long as a candle continues to burn, the miner is safe, notwithstanding the fact that a candle may burn brightly when the surrounding air contains sufficient poisonous gas, such as carbon monoxide or oxides of nitrogen, to cause almost immediate death to persons breathing it.

Blasting Timber Causes Metal-Mine Fires

Fires.—Fires in metal mines have been caused by the spontaneous combustion of manure, by the ignition of hay, timber, or similar combustible material, by candles or matches, by the short-circuiting of electric wires, by the blasting of timber, by the use of fuse and dynamite in the vicinity of timber and by other causes. In the past, most metal-mine fires were started by the careless handling of candles, but the recent displacement of that means of illumination by the

carbide lamp has greatly reduced the fire risk, though the extension in the use of electricity for fans, pumps, locomotives, etc., has added a new hazard.

Most coal-mine fires have been caused by ignitions of gas or coal dust, by the use of dynamite, black powder and open lights. Fires also are occasionally caused by spontaneous ignition or the ignition of timber due to defective electric wiring. In general, coal-mine fires are extinguished by sealing or loading out the hot material—coal and slate—whereas metal-mine fires are put out by sealing or flooding, the latter method being used in metal more frequently than in coal mines.

Opening Mines.—Workings in coal mines generally can be planned ahead, and provision made for future requirements as to ventilation, haulage, etc. Immediately upon opening, intake and return aircourses are started, and underground workings are driven in duplicate, triplicate, etc., so as to provide for the circulation of air, and at the same time to afford more exits than one in case of a fire or a cave-in.

On the other hand, only infrequently can workings in metal mines be planned ahead, owing to the uncertainty as to the location, continuity or persistence of the ore deposits. As a result, usually but one opening is made into metal-bearing property until its ore bodies are well proved; and underground openings generally are driven singly. Hence it is difficult, in fact almost impossible, to provide adequate air circulation or even adequate protection to workers in case of cave-in or fire.

GUNITED TIMBER IN A CROSSCUT AT BUTTE

Anyone who notes this timbering will realize the fact that metal timbermen are, and must be, superior to those in coal mines. These timbers are some of the few being gunited in metal mines to preserve them from rot. This preservation it effectually affords. The narrow, badly cluttered roadways are a danger which would be greater were the crosscuts driven on a steep grade. Being level, and the car trips being short, the danger is somewhat reduced.

As a consequence, many metal mines have but one opening and are extremely unhealthy and dangerous places in which to work. Workings in coal mines frequently have their height determined by the thickness of the coal seam, and where a seam is 3½ to 5 ft. in thickness, the employees are bent over when walking or working, a condition seldom found in metal mines and one which the metal miner resents when he does encounter it.

Development.—The room-and-pillar system of coal mining roughly resembles the various stoping systems in metal mining. Some real room-and-pillar work is done also in metal mining. The caving systems therein, moreover, somewhat resemble the longwall method in coal mines. In general, the excavations are more frequently back-filled in metal than in coal mines, and the percentage of extraction from the original deposit in metal mining is far better than in coal mining. The strip pit in coal mining is similar to the steam-shovel methods on iron and copper deposits.

The "room" in coal mining is essentially the "stope" in metal mining, and the coal-mine "entry" corresponds to the metal-mine "drift," a "crosscut" in a coal mine is a short connection between two entries, or two rooms and is driven, in general, wholly in the coal; the word "crosscut" in metal mining usually is used to denominate an underground level which is driven in the country rock to intersect a vein. It is not used to designate a passageway driven in ore. The coal miner's "roof," or "top," is the metal miner's "back," and the "rib" of a room or entry in coal mining is the same as the "side" or "wall" which the metal miner leaves in driving his stope or his drift.

Ventilation.—The planning of ventilating systems is done largely before steps are taken toward the actual opening of coal mines, whereas many metal mines never have a ventilating system, and the few that do, install one only upon necessity. Many of the main fans in metal mines are placed underground, but to put a main fan underground in a coal mine would be a criminal absurdity, and no state law would allow it. As heretofore indicated, coal-mine openings are driven in pairs to allow of one opening for intake air and another for return air, and state laws generally require moving currents at all working faces.

Only rarely are metal-mine workings driven in pairs, and not 25 per cent of the working faces therein have air with perceptible circulation. Coal mines use overcasts, brattice cloth, air regulators, etc., to deflect air currents, but these are almost unknown in metal mines. Though the use of electrically driven fans underground as "boosters" is generally condemned in coal mines, it is a sign of progressiveness in metal mines.

The placing and use of numerous doors is good practice in metal mining but poor practice in coal mines, especially those which are gaseous. Ventilating doors in metal mines usually are flimsily constructed and maintained, whereas the doors in coal mines generally are fairly well-constructed and kept in good repair.

Lighting.—In general, metal-mining companies have been accustomed to supply lights for underground workers, whereas coal miners have paid for their own lighting. The candle so long supplied by the companies and used by the metal miner has not been used by the coal miner, largely because the air currents provided in coal mines would extinguish the candle flame.

SUPPORTING A MINE "BACK" WITH TIMBER

The "back" is the hanging wall of the vein, which is not stratified in the same direction as the mineral is lying. The country rock may be level while the vein is at a steep vertical angle. Moreover, the volcanic matter often has weakened the walls of the passage that it has made for itself, and the back consequently is dangerous like the roof above coal beds.

On the other hand, the old-time coal miner's oil-lamp could not be used in metal mines because, owing to the deficient ventilation in 90 per cent of the working places, the smoke it would cause would drive the men out. At present, where open lights are allowed, both coal and metal miners use carbide (acetylene) lamps, the coal miner buying both lamp and carbide. In general, the metal miner buys his lamp (usually from the company and at cost), the company supplying the carbide. In coal mines the carbide cap lamp is used almost exclusively, but some metal miners use this type of lamp and others a carbide lamp with a candlestick attachment. Many coal mines—both gaseous and non-gaseous—require miners to use electric safety lamps owned and maintained by the company, with rental charged the miners; but, as far as my observation goes, none of these electric safety lamps is yet used in metal mines, though their use would do much to eliminate fires.

Explosives and Blasting.—In metal mining magazines for explosives usually are placed underground, but this would be criminal in a coal mine. No coal miner would think of firing a shot without having inserted previously and firmly tamped some stemming material, whereas the metal miner often puts nothing in his blasting hole but straight explosive, frequently inserting a few extra sticks as stemming. However, there is increasing use of inert stemming among progressive and efficient metal miners.

The coal miner generally buys his own explosive and consequently is quite willing to use stemming. As the metal miner usually is furnished with explosive by the company which employs him, he sees no reason to go to the exertion of finding inert stemming. To save explosives and to decrease the proportion of fines shot down, the coal miner frequently undercuts the working face and then fires an opening or "buster" shot, delaying the other shots until the material shot down from the latter has been removed.

On the other hand, the metal miner does no undercutting, and though he fires his "cuts" (corresponding to "busters" in coal mining) first, usually he has provided to have the lifters blasted a few seconds later. These are heavily charged so as to throw material away from the face, all shots generally being loaded in such manner as to produce a maximum of fines.

Coal miners generally use black blasting powder, and occasionally 30 to 40 per cent dynamite; but in recent years dynamite, and to a certain extent black powder, has been superseded by permissible explosives, many of which are a modified dynamite with shorter and cooler flame and less violent action. The metal miner rarely, if ever, uses black powder, except in open-pit work.

Experiments with permissible explosives are being made in the hope that the number of fires in metal mines resulting from the blasting of timber may be reduced. It is hoped that, in a similar manner, accidents will be made less frequent in open-pit work. To use a mixed charge of explosive, such as two grades in a hole, is a dangerous practice when coal is the mineral being extracted, because gas or dust may be ignited by the successive flames due to different rates of detonation. On the other hand, the use of two grades of explosive in a metal mine is recommended as a means of obtaining additional strength of detonation. For instance a stick or two of 60-per cent gelatin may be used as a primer in a charge with several other sticks of 40-per cent strength. Material is more often shot by electricity in coal than in metal mines, the metal miner, even in shaft-sinking, generally preferring to use fuse to which he is accustomed rather than to change his habits of years and adopt a much safer practice.

Drilling.—Ability to drill holes with compressed-air machine drills determines largely the degree of proficiency of the metal miner, and air-compressors are an indispensable part of the metal-mine equipment; but in coal mining, drilling ordinarily is done by hand-operated machines and is a comparatively unimportant side issue. (In recent years in some mines the coal has been drilled by electric machines.) Compressed air rarely is available at a coal mine, especially since the electrically driven undercutting machines have displaced the puncher undercutter.

Tools.—The metal-mining company generally supplies all tools, hence drills, hammers, shovels, etc., frequently find their way into the waste rock or filling, or are otherwise lost or destroyed. The coal digger generally buys his own tools, such as picks, shovels, drills, etc., and in consequence rarely loses them. The coal miner invariably uses a short-handled, square-pointed, wide-bladed shovel and a light, sharp pick. The metal miner uses a narrow-bladed shovel with the blade either round or square, generally with a long handle. Where picks are found in metal mines they usually are of large size

"CROSSCUT" IN A COLORADO MINE

A "crosscut" in metal-mine parlance is a roadway driven level from a shaft through the country rock to a mineral vein. It is not located in the mineral, being extracted in "ground" that has no value. This crosscut has been driven by hand and is extremely irregular.

and not particularly sharp. The coal company often charges the miner for sharpening picks and other tools, but this is seldom if ever the practice in metal mines.

Timbering.—Though the coal operator makes a determined effort to save timber for re-use where possible, and immediately takes up for re-use rails and ties from abandoned places—even if abandonment is but temporary—only rarely does one see an effort made to save timber in metal mining except possibly some floor lagging, and the quantity of steel rails, pipe and ties allowed to decay and rust in many of our metal mines would put the ordinary coal company into bankruptcy. Timbering in metal mines is much more systematic than in coal mines, and the metal miner is a much more efficient timberman than the coal miner.

Coal or Ore Cars.—In metal mines the cars in use almost invariably are of steel, but in coal mines they usually are of timber with steel straps, though steel cars are becoming more numerous in coal mines. Similarly, metal mines use steel rails almost exclusively, but one frequently finds wooden rails in coal mines, especially in rooms. The metal mine uses skips and skip-pockets, whereas but rarely is the skip found in coal mines, unless the coal is to be used for steaming purposes.

Similarly, sheet-iron turn-sheets, which are used in connection with the tramming of cars in metal mines, are seldom used in or around coal mines. In general, much larger tonnages are handled in coal than in metal mines, and haulage ordinarily is much more efficiently arranged and the track better maintained in coal than in metal mines. However, the largest average daily output from any one underground shaft in the United States comes from a metal mine. This mine produces 20,000 tons of copper ore normally whereas the largest bituminous-coal shaft hoists only 8,000 tons per day.

By intensive mining methods the metal mine obtains a much higher percentage of material from the ground than does the coal mine, which in many cases (mostly lignite mines), wastes 75 per cent or over of the original coal available. Filling after mining is done much more systematically in metal than in coal mines.

Personnel.—A daily or shift wage has predominated in metal mining, but during or toward the end of the World War, contracting or bonus and penalty systems were introduced somewhat freely in driving drifts, crosscuts and raises, in drilling holes, in setting timber, in stoping, etc. In coal mines, contracting has for years been the rule in much of the underground work, except that relating to the transportation of coal.

Wages in metal mining generally were higher that in coal mining before the war, but during and since that period the coal miners' earnings per day or per year probably will exceed those of the metal miner. Though the coal miner's employment is seasonal and more or less intermittent, he is in general assured of at least 200 days' work per year and in some years 250 or more days (if he cares to take it), and his daily remuneration is comparatively high. The metal miner works at a lower rate per day, and if business conditions are depressed, cold weather does not ensure him any work. On the other hand, when "times" are normal, the metal miner has much the more steady employment.

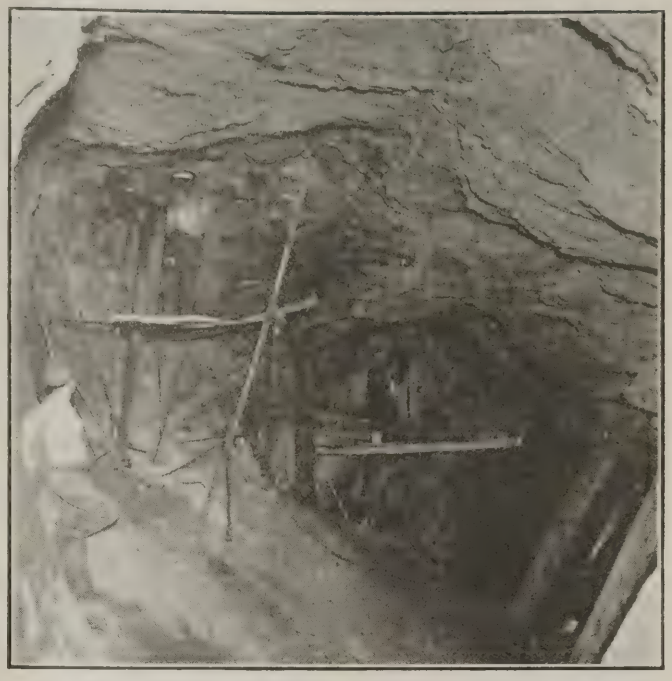
The proportion of English-speaking men probably is greater in metal than in coal mines, and, at least in the West, it is noticeable that there are comparatively few Japanese or Chinese in metal mines and comparatively few Irish or Finns in coal mining. Coal-mine

HYDRAULIC STRIPPING LAYS BARE THE MINERAL VALUES BELOW THE SURFACE

This is not a gold placer but an iron-ore mine. The surface is being stripped hydraulically. This practice seems as unusual in iron as in coal mining though some of this work has been done in both. The stripping shown is known as the Rowe mine and is in Crow Wing County, Minnesota, on the Cuyuna Range. Rowe is near the town of Riverton, a village located close to the Mississippi

workers are much more thoroughly organized than metal-mine workers. A somewhat peculiar condition exists at many metal mines, in that the miners (general underground workers) are unorganized, whereas certain crafts (machinists, hoisting engineers, electricians, etc.) are thoroughly organized, yet all work together in comparative harmony. The coal-miner's union includes all occupations in or around the mine, whereas around metal mines, where any group of men is organized, the various occupations, such as miners, hoistmen, machinists, and others, each have their separate organizations.

Products, Markets, Wages, Prices, Costs.—The metal-mine operator produces a commodity for which the selling price is, to a large extent, fixed. Hence there is comparatively little direct local competition, whereas each coal operator, at least up to the time of the war, negotiated his own selling price. Consequently local competition was keen. Largely as a result of these conditions, metal-mine operators could co-operate and work harmoniously.



On the other hand, while coal operators formed associations, only too frequently there was no real harmony; and even if there was peace on the surface, there was only too likely to be subsurface undercutting of prices, juggling of the sizing of coal, tampering with wage scales, etc. Notwithstanding these factors, costly litigation has been much more frequent between metal-mining companies than between coal corporations. To-day, with metal prices low—that is, considering war prices and present operating costs—the metal-mine operator is anxiously trying to hold wages and all other costs to a minimum, and in doing this the lower wage fails to hold labor.

On the contrary, the public has a well-defined suspicion that coal operators have a community of interest with their employees in holding high the wages and general cost of coal, in order that the profit per ton may be held as high as possible, as it is obviously easier and much more remunerative for the coal operator to take a profit of 50c. per ton on coal, now costing about $3 per ton at the mine, than it was to take 25c. per ton on coal costing $1.50 or less per ton in pre-war times.

Moreover, with the higher wage, the coal mine attracts and holds labor, even with other work plentiful and operations at the coal mine intermittent. To be commercially available, the cost of producing coal rarely can be more than $4 per ton, and is usually under or around $3; on the other hand, the cost of producing a ton of ore may be over $20 or even over $100, and yet the operation may be profitable. The price of some metals, such as copper, is dependent largely upon foreign demand, whereas the price of coal, except in a few localities, is practically independent of foreign influences.

How Coal and Metal Miners and Engineers View One Another.—In general—at least in the past—the metal-mine employee from general manager to shoveler, considered himself much superior to corresponding grades of workers in coal mines. For instance, I have yet to encounter a metal-mining engineer who did not look with ill-concealed contempt on the coal-mining engineer, yet the latter undoubtedly has a greater number of intricate operating problems to encounter than his metal-mining brother and, in general, has much the greater record of efficiency to his credit.

Coal-mine foremen generally are disinclined to employ metal miners because they feel that the latter will

A STOPE IN THE CALUMET & HECLA

After all a stope is nothing more than an extremely steep room. Here the stope is empty except for timber, and the men have to watch against an awkward slide. Note the scaffolds which the men have erected to aid them in using machine drills.

"agitate" or, if employed on wages, will be inclined to "take five" (take frequent resting spells) as frequently as they had been accustomed to do in metal mines, which would be far too frequently for general coal-mining practice. Nearly all metal mines have an assayer or a chemist, or both, whereas only rarely is either found at a coal mine. Similarly, the geologist finds employment at or around a metal mine much more frequently than at a coal mine because the ore must be followed, and the veins or deposits more often than not are faulted and uncertain, whereas in this country the coal beds usually are comparatively regular and continuous, and their prospecting by drill-holes is comparatively simple.

Safety and Health.—Notwithstanding the almost universal impression of metal-mine workers that coal mining is too dangerous for them, the annual record—especially in recent years, even when explosions from gas and dust are included—frequently indicates that there were more accidents per 1,000 men employed in metal than in coal mines, though ten or more years ago metal mining had much the better record of the two. Considering only those accidents occurring from ordinary causes (eliminating those from explosions of gas and dust) there is no doubt that the coal miner has much the safer occupation.

The decreasing accident rate in coal mining is due largely to the eliminating of explosions of gas and dust by taking advantage of our latter-day knowledge of the methods by which these major accidents may be prevented. It must not be forgotten, however, that there was what appears to have been a sort of epidemic of major coal-mine accidents late in the year 1922.

In my opinion those metal-mining companies which make a definite attempt to reduce the accident rate generally have a much more efficient organization than can be found similarly engaged at coal mines. The metal-mining company generally chooses as safety man a young, vigorous and forceful engineer who has had underground experience as shift-boss and possibly in

WATER STOPING DRILLS IN DAVIS-DALY MINE

The head of the standing driller is almost touching the "back" or the "hanging wall" of the stone. The man with the drill steel is sitting on the edge of the footwall and at his back is the mineralized material into which the drill is holing. The men's feet are on waste material, on which indeed two of the men are squatting. The use of drills is more extended in metal than in coal mines.

other capacities; whereas ordinarily the safety man at a coal mine is a foreman or superintendent incapacitated by age or physical infirmity for performance of his ordinary work. It is for this reason that he is placed in the safety department, and the inevitable result is that the safety or inspection work is made less effective.

The men generally are better supervised in metal than in coal mines, as a shift-boss in the former rarely has over 50 men under his jurisdiction, and he is in the mine while his shift is at work. The coal mine usually has a fireboss for every 100 to 300 men, and he works chiefly while the men are out of the mine and has comparatively little authority over the men when he is in the mine. When a coal miner is killed underground, work in that mine automatically ceases for the day, and in places the day of burial causes another day's shutdown. On the other hand, the death of a metal miner underground occasions little comment, except among those who aid in removing him from the mine.

The metal mine has no official similar to the fireboss at a coal mine, who examines the working places to see if they are safe before the workers enter them. It would seem advisable, however, to follow coal-mining practice in this regard at metal mines so far at least as to have someone examine workings after shots are fired, in order that incipient fires might be discovered. In case of fire, many metal mines now have an efficient method of warning miners. Stenches are introduced into the compressed-air lines. So far, coal mines have not developed any system of warning as efficient as the stench method.

From the point of view of health, the coal miner has much the better occupation. He works in comparatively good air with comfortable temperatures, and as the air is cool is not bothered by humidity, whereas frequently the metal miner, even when performing actual work only a fourth to a third of the shift, is compelled to wring sweat out of his shirt every few hours.

Though coal dust is explosive, its ordinary physiological effect on the mine worker is held to be negligible —at least until he has worked in it for 30 to 50 years— whereas metal-mine dust, acting through lead poisoning, miners' consumption, etc., sends hundreds of miners to graves before they have worked in it over five years and before they have reached the ordinary prime of life. It is probable that metal-mine dust kills far more men annually in the United States than does coal dust, even including deaths from dust explosions.

Metal mines generally are provided with systematic underground toilet facilities. These are almost wholly lacking in coal mines. Metal mines, too, frequently provide the miners with ice water in barrels set at convenient points underground or pipe city water to central points with available faucets, sanitary fountains, etc., whereas the coal miner generally carries his own drink in his bucket.

Conclusions.—The following conclusions may be drawn from the preceding:

1. Interchange of methods—coal from metal mines. It would appear to the writer that coal-mining operators could with advantage adopt the following methods and practices from metal mines:

(a) Choose young, active, forceful, yet experienced engineers as safety men, paying them enough to attract them to the work.

(b) Provide a more intensive supervision of work (comparable to that of shift-bosses in metal mines) to look after pillar drawing, haulage, timbering, etc.; especially should pillar-bosses be employed more frequently than at present.

(c) Pay more attention to machine drilling. Much of the present-day heavy shooting of coal, giving slack instead of lump, is due to the disinclination of coal miners to drill a sufficient number of holes so that each hole may be loaded lightly.

(d) Provide sanitary toilet facilities underground. This, though now regarded as an absurdity, will undoubtedly be an accomplished fact within ten years.

(e) Learn metal-mine methods of timbering and back-filling and apply them to the support of worked-out coal areas.

(f) Follow the lead of the metal-mine operators in reducing the costs of mineral extraction. If this is not done, coal-mine operators will most certainly alienate the good will of the general public, and some sort of governmental regulation of the industry will possibly result.

2. Interchange of methods—metal from coal mines. Metal-mining operators could with advantage adopt the following coal-mining methods and practices:

(a) Provide more adequate ventilation, thus assuring more healthful and comfortable working places, for this provision will reduce the formation of dust and its dissemination, will lower high air temperatures and humidities and will prevent men from being gassed by

MESABI OPEN PITS LIKE ANTHRACITE STRIPPINGS

In the Mesabi region the cover over the iron ore is taken long distances in large dump cars instead of being cast and dug by the same shovel, as is the method in bituminous strip pits. The locomotives are larger, the shovels are bigger and the cars are of greater capacity in the Mesabi than in the anthracite region. This is a small pit and the shovels are smaller than is the general practice at metallic ore strippings.

the fumes from explosives, etc. In general this can be done only by utilizing mechanical fans with doors, ventilators, tubing, brattices, curtains, etc., all under the constant supervision of a competent ventilating man. In short, metal mines should consider ventilation a vital part of operation instead of a fad or a more or less useless side issue.

(b) After having provided safe and healthful working places, place all work as far as possible, including timbering, drilling, shoveling, blasting, etc., on a contract or bonus basis.

(c) Adopt the haulage methods employed at coal mines, including larger cars, wider gage, the elimination of hand tramming, the introduction of storage-battery locomotives, etc.

(d) Reform the entire method of storing, handling, and using explosives underground. Reduce the consumption of explosives to a reasonable figure by making an intelligent use of stemming.

(e) Compel the workers to buy their own tools, as is done to a great extent in coal mining. If miners and shovelers had to buy their own wrenches, picks, shovels, etc.; and if machine drills and drilling steel were charged against users until returned, the waste piles of our metal mines would not contain the thousands of dollars worth of that material now there. This, of course, is ultimately charged against the cost of production of the metals mined.

(f) Use more systematic methods in handling and distributing timber underground. Thereby much timber could be recovered and re-used in metal mines, and much of it which is now lost without ever having been used could be saved from decay, caves, etc. Remove rails, ties, pipe, etc., immediately from abandoned places and put them in use in active workings, even though it may be necessary in a year or so to replace them in the workings from which they were temporarily withdrawn.

(h) Use electric lamps with the system of rental charge as at coal mines. Thus an ever-present fire menace would be removed.

(i) Use permissible explosives or electric shotfiring in shooting timber. This would tend to make impossible the fires now caused by the use of dynamite and fuse.

(j) Make a more intimate study of the gases which may be met in mines. For instance, it should be learned that it is *not* always safe to go wherever a candle or a carbide lamp will burn, as such an atmosphere may contain carbon monoxide or other dangerous gas. Recently explosions of methane in metal mines have indicated that exploring abandoned places with naked lights is dangerous even in metal mines.

Jig Operating Without Suction Through Coal Bed Serves as Its Own Pump

WHEN the product of a coal mine contains much material in which pure coal is so intimately mixed with refuse that they cannot be broken apart, and when the mixture is of such a specific gravity that it is little different from that of clean coal, jigging is likely to become wasteful or ineffective. Another problem in washing is that of handling the fine coal. The old idea with jigs was to disturb the coal and refuse—and the jig certainly successfully did so—by water under pressure on the upstroke and with a water suction on the downstroke.

The more modern idea is to apply the force in one direction. It makes no difference whether the separation is made by water or air—the lighter material will be driven farther from the side from which the force is applied. If the force comes from opposite sides alternately, the mass will only be mixed and not separated. This is the theory upon which the Montgomery coal washer, built by the Montgomery Coal Washing & Manufacturing Co., Birmingham, Ala., was designed.

The crushed coal or coal to be washed is fed to the jigs either from a storage bin directly above and at the back of the jigs or is elevated from a storage bin built on the ground. In the latter case the feeder gate feeds the coal to the elevator, and the elevator feeds the jigs. If the bin is above the jigs, the gate is arranged as shown at *A* in Fig. 1. In any event the coal falls into feeder box, *B*, and the separation of the coal from its impurities then begins. The refuse that is heavier than the coal, as it falls more rapidly than the purer material through the water in the jig, reaches the stationary screen, *D*. This screen is gently inclined toward the slate gate, *M*.

That gate, which is kept closed until the slate bed rises to the level, *I*, is adjusted by motion of the lever, *R*, which has a latch for engaging in the quadrant, *Q*. This quadrant can be made to oscillate by contact of the roller, *S*, against the weight lever, *P*. Owing to

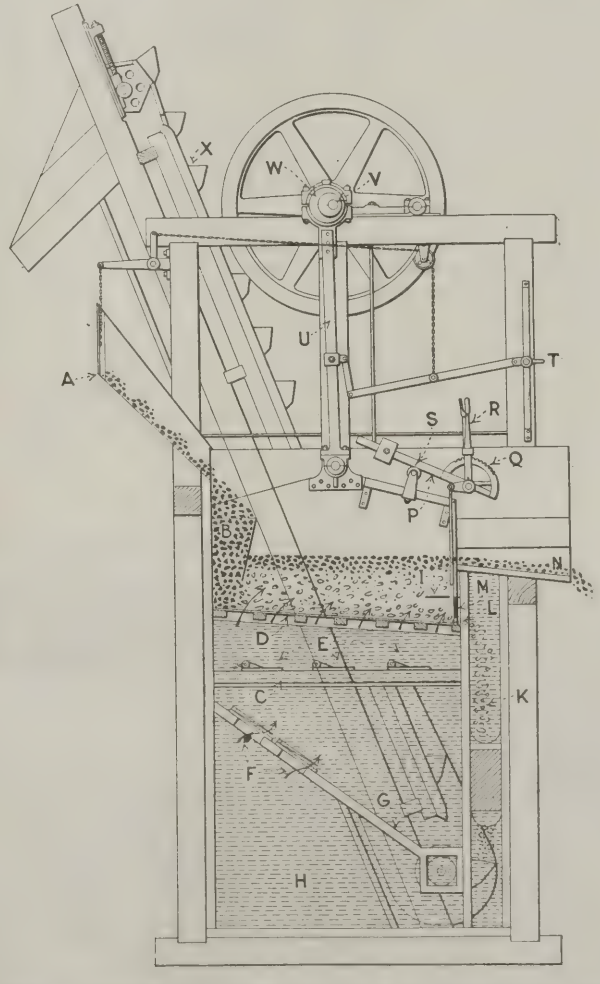


FIG. 1—VERTICAL SECTION OF COAL-WASHING JIG

The plunger of the jig is at *E*, and it has on the upper side valves which open upward and allow water to pass through them when the plunger is lowered and which close when it is raised, enabling the plunger to draw water through the valves *F*. *D* is a screen on which the refuse and coal rest, the former, which is the heavier of the two, being next to the screen. Water passes up through the coal but never goes back through it. It leaves by the coal overflow, *N*, and after settling is introduced below the plunger. Thus the suction of the plunger does not disturb the coal bed on the screen.

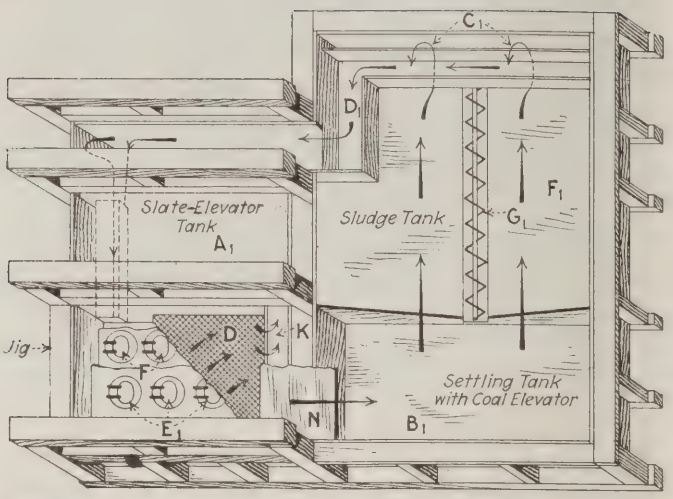

FIG 2—ISOMETRIC VIEW OF JIG AND SETTLING TANK AS SEEN FROM ABOVE

Almost a plan view. The water-bearing coal leaves the jig tank at *N* and falls into a settling tank where a self-draining clean-coal elevator removes the sedimentary material. On account of the size of this tank, the water moves very slowly toward the return trough and the fines settle to the bottom and are caught by a spiral conveyor which carries them back to the clean-coal elevator, where they are mixed with the larger sizes of coal and carried out to washed-coal storage.

this latitude as to movement, material can be handled varying in size, for the larger pieces of refuse are allowed to pass out with the finer materials at *L* into the slate trough *K*, which is inclined toward the slate compartment (A_1, Fig. 2), where it is carried away by an elevator (*X*, Fig. 1) for disposal.

The coal, being lighter than the refuse, rises to the top of the coal box and is washed out by water at the overflow, *N*, into the settling tank (B_1, Fig. 2), from which it is removed by a dewatering elevator, not shown, to the storage bin for washed coal. Much water also leaves with the coal at *N* and enters the tank, B_1, where it has an opportunity to settle. The water, thus cleaned, overflows at C_1 into the passageway D_1 and passes back into the water compartment of the main jig tank. From this compartment it enters the waterway, *H*, under the inclined bottom, *G*, of the jig tank. On the upward stroke of the plunger, *C*, the valves, *F*, open, and water enters on its underside, whereas on its downward stroke the valves, *E*, open in the bottom of the plunger, *C*, admitting water on top of the plunger between it and the screen frame, *D*.

On the upward stroke of the plunger the water is forced through the screen, *D*, and through the bed of coal and refuse. It then passes out through the overflow, *N*, to the point of beginning. Thus the jig acts as its own pump, and centrifugal pumps or tanks set on high towers are not required, as the water returns by gravity from the settling tank to the jig tank, and the jig does all the pumping that is necessary. In this way less machinery is required, all of which reduces maintenance and running expense and the frequency of breakdowns. Not infrequently a division in function at a washer between two or more machines, like a division of labor between two or more men, doubles or otherwise increases the possibility of trouble. The only fresh water needed is that which is necessary to replace the water carried away with the wash coal and refuse, which is about 50 gallons per ton of coal washed.

A few words should be added relative to the driving mechanism. The plunger, *C*, is driven from the main drive shaft, *V*, through an adjustable eccentric, *W*, and the connecting rod, *U*. The feeder gate, *A*, is operated by the floating lever, *T*, which is attached to the connecting rod, *U*, and the quantity of coal entering the jig is regulated by raising or lowering the lever, *T*.

The adjustability of the eccentric is an item of much importance, for jigs that will wash one class of coal will not give satisfactory results with another. An adjustable jig, therefore, is necessary, for it can be regulated to suit the class of coal that at any time may have to be washed.

Some further information should be given regarding the settling tank. These tanks are built with ample width and very long in order to give the coal time to settle before water is returned to the jigs. An elevator boot is provided somewhat deeper than the remainder of tank B_1. The settling part of the tank F_1 is built in variable lengths, depending on the class of coal and the number of jigs. It is V-shaped and in this V runs a screw conveyor, G_1, that returns all settlings to B_1, where they are picked up by the dewatering elevator, not shown.

FIG. 3—MONRO-WARRIOR COAL & COKE CO., WASHERY AT NO. 1 MINE, NORTON COAL MINING CO.

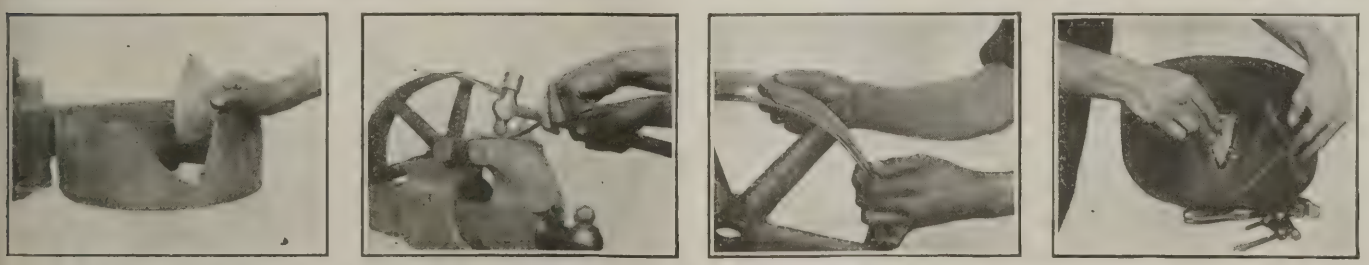
This plant at Nortonville, Ky., has a capacity of 1,600 tons per day. It was completed in the early part of this year. The Norton Coal Mining Co. is a subsidiary of the company that owns and operates the washer.

How to Repair and Balance a Broken Belt Pulley

Broken Pulleys May Be Put Back in Service by Repairs Made at the Mine — Method of Balancing a Pulley — Preventing the Belt from Slipping—Covering a Pulley for Greater Adhesion

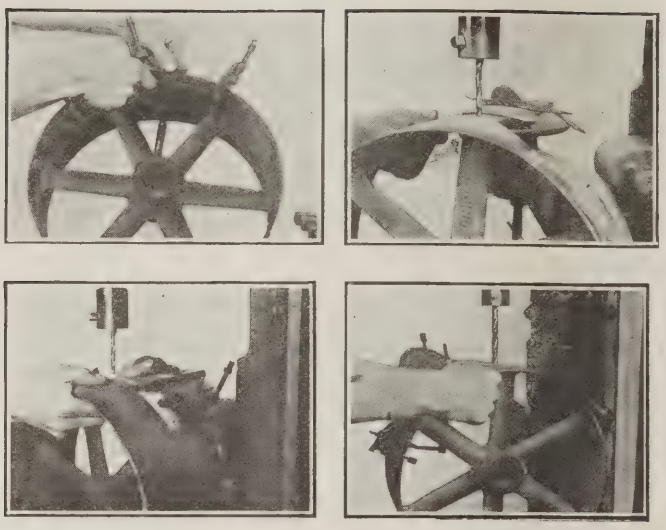
By Gustav H. Radebaugh
Mechanical Department, University of Illinois. Urbana, Ill.

A FEW of the common kinds of material from which pulleys are made are wood, pressed steel, paper-pulp composition and cast iron. The two most common types of pulleys are split and solid. The split pulley is used exclusively in transmitting power from line shafting. In using this style of pulley it is never necessary to take down the shaft to remove the pulley, this being an advantage over the solid pulley for this kind of transmission work. The drive pulley on an engine, or main machinery shaft generally is a solid pulley. These pulleys give much better service on this type of drive than can be obtained by the split pulley.



A pulley delivering considerable horsepower that is keyed on the shaft and is expected to render long and continuous service must never have an opportunity to loosen up on the shaft fit. This, of course, is impossible with split pulleys. The clamp bolts become loosened, causing the pulley to spring apart. On ordinary small drivers the split wooden pulley is used to good advantage, it being unnecessary to cut keyways and fit keys. The pulley is held on the line shaft by friction. The center bushing which fits on the shaft is fitted in the pulley in such a manner that tightening the bolts clamps the bushing securely to the shafting. Pulleys of the same design can be used as drivers and as loose pulleys. If used for a loose pulley, a brass bushing and grease cups must be provided. The pulley, which is used as a driver, must be arranged with setscrews or keys, or both.

Pulleys on mine power-driven machines quite frequently are broken or damaged to such an extent that it is impossible to repair them. Many pulleys, however, are discarded that could be placed back in service by a little planning and a few minutes work in the mine shop. There are two common ways of patching broken cast-iron pulleys: by oxy-acetylene welding and by patching with rivets. If the spokes are broken, about the only practical method is the welding process. This necessitates taking the job to a commercial shop for the repair if the mine repair shop is not equipped with a welding outfit. If the flange or face of the pulley is broken, the repair can be made in the mine shop, which is advantageous in conserving time and cost. If the machine is in use and the broken pulley throws it out of service, every minute that can be saved means a great deal as several trucks, teams and men may be held up on the job until the pulley is repaired.



When a pulley is broken as shown in Fig. 1 it may be impossible to find all the pieces that came from the fracture, but as many pieces as can be found should be gathered up and kept for the repair. After close examination of the pulley for other cracks has been made the method of mending the break should be decided upon. In this job the pulley is cracked across its entire face. This necessitates placing steel straps on each side of the spokes. To proceed with the repair procure a piece of soft steel scrap about $\frac{5}{16}$ in. or $\frac{1}{4}$ in. thick to 1 in. to $1\frac{1}{4}$ in. wide and cut to a length that will permit 3 or 4 in. to extend on each side of the patch or crack. The stock is then bent to the proper radius to fit the inside of the pulley. The bending operation is shown in Fig 2. Notice how simple it is to bend the piece when it is held in the vise as shown. The vise jaws are opened and with the ball peen of the hammer the stock is bent to the desired shape.

A good job of bending is important, as the strap will fit the job much closer if the bend is an even one and the pieces that were broken from the pulley can be held in more accurate position. In bending steel stock of this size a much better job can be done with the stock cold. It is common among some mechanics to heat a job such as this for bending. It will be found, however, that the cold bend is much easier and is just as good. During the bending operation constantly check the shape of the bend with the pulley. After you are satisfied that the strap has been fitted as closely as possible it is then ready to be located as in Fig. 3 and clamped in position. If it is at all possible, the strap should be located about $\frac{3}{4}$ in. from the edge of the pulley. This, however, is entirely influenced by the shape and number of the pieces broken from the fracture.

A glance at this view will show the large piece that was being held by the operator in operation 1 is fitted in place, showing that another small piece is needed to finish out the patch. This piece was either lost or was in several small pieces. This makes it necessary to cut and shape a piece to fit, as shown in Fig. 4. This was made from aluminum taken from the lower portion of an old discarded crankcase. A template was made

FIGS. 1, 2, 3 AND 4—FITTING THE BROKEN PIECES INTO THE PULLEY AND FORMING THE BRACE
All pieces of the broken section are gathered and matched in place. Any pieces too small to be fastened to the brace are discarded. The bracing piece is then formed as accurately as possible and the face of the pulley filled in with the large broken pieces and a filling piece which takes the place of lost parts or small parts

FIGS. 5, 6, 7 AND 8—CLAMPING AND DRILLING PREPARATORY TO RIVETING

After all parts are assembled an extension is placed on the plate of the drill press. This plate prevents the pulley from rolling and permits the proper drilling of the holes for attaching the broken pieces to the brace and the brace to the pulley.

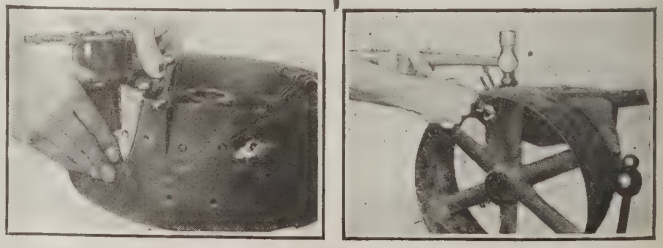
of the exact shape of the required piece; the aluminum was then marked off, sawed, and filed to shape. It was then fitted into position.

Fig. 5 shows clearly the location of the patching strip. The operator is making close inspection of the patch to be sure that all pieces fit properly. In clamping a job such as shown here the parallel machinist clamp will be found best adapted to the job. Clamps taken from old clothes wringers also can be used. This job could be done without the use of clamps, but it is not recommended, as it makes the job much more difficult. When clamps are not available the approximate location of the holes can be made in the rim and a hole drilled. The strap is then marked off and the hole drilled. It is then riveted in position. The next hole is located and drilled and the rivet placed. This is continued until the job is finished. You will be very fortunate if a good smooth job is obtained. It is obvious that it would be difficult to hold the pieces in place while drilling.

The clamps hold the pieces securely in the proper position, which insures a good, even job. Every mine shop should be equipped with a couple of pairs of good dropped forged clamps. They will pay for themselves in a short time. After the pieces are clamped in position on the patching strip, the job is now ready to be laid out for drilling. Some discretion must be used in locating the holes. They should be placed to insure proper holding of the patch with the rivets.

To make the job of drilling an easy one, an old shop practice, as shown in Fig. 6, can be employed. In drilling holes on a job of this kind it is nearly impossible to place the pulley on the table and drill, as the tool has a tendency to roll. If this happens, a broken drill is the result. By clamping a small board on a strip of steel on the platen or table of the drill press as shown, the pulley easily can be held in a positive drilling position. This type of drill press set-up is used for all cylindrical jobs which are to be drilled on the periphery, such as the drilling of steel bands for water tanks, drilling of holes when covering pulleys, etc.

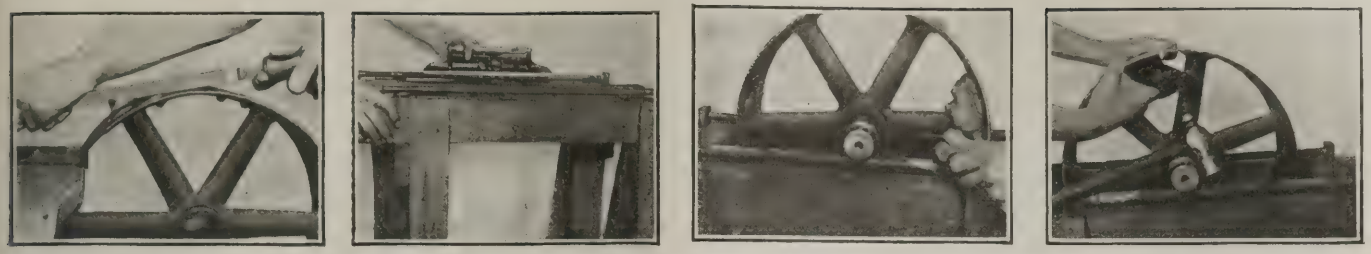
The size rivet that is to be used is decided upon and the proper drill for the rivet is selected. For a job as shown here a ¼-in. rivet round head is satisfactory. If rivets cannot be found in the shop supply, it is an easy matter to make up enough for the job from ¼-in. round stock.



The job is then placed on the strip clamped to the table of the drill press and all the holes are drilled as indicated in Fig. 7. The surface of the pulley must be left smooth. This necessitates the countersinking of the holes, which permits the rivets to be driven down flush. This can be done with a countersinking tool or with a drill that is twice the diameter of the rivet. In Fig. 8 is shown a ½-in. drill countersinking the holes preparatory to riveting. A rivet is placed in a hole and gaged for proper length, as shown in Fig. 9. It should protrude from the face of the job three-quarters of its diameter for a countersunk head. This, of course, is regulated to a certain extent by the depth of the countersink. Judgment must be used, as it may be best to cut one rivet to estimated length and rivet it down. This will assist in gaging the length of the other rivets. It always is best to have the head fill the countersink completely.

The most convenient way to hold this job for riveting is by placing a heavy bar of iron in the vise and clamping it securely. Hold the pulley for riveting as shown in Fig. 10. By backing up the rivet in this manner and delivering light, firm blows with the ball peen of the hammer a good tight job should be the result. The loose pieces which were fitted closely in position and held securely with the clamps driving the drilling and riveting operation are now held securely in place with the rivets. The clamps can now be removed. The newly formed heads of the rivets oftentimes are not riveted down flush and it becomes necessary to file them flush with the pulley face, as shown in Fig. 11.

The view in Fig. 11 gives a good idea of the correct way to hold a file. Notice how the operator's right hand grasps the file handle. His forward stroke is the cut stroke, and by grasping the file firmly and applying a little pressure the file cuts as it is designed to do, removing the extra head of the rivets with a few strokes of the file. Too often the file is held in one hand and rubbed over the job and expected to cut. This is hard on the file and is improper practice. The file pressure always should be released on the return stroke.



A file never should be used without a handle—it is too dangerous a practice for the shopman as he has seen the many accidents caused by handleless files. Therefore, the mine-shop foreman should take advantage of the well-established practice and supply files with good, substantial handles of proper shape, so that better jobs of filing can be done that will protect against accidents. This operation completes the patching of a pulley.

If the pulley just repaired is used on high-speed power transmission it may be necessary as well as advisable to balance the pulley. The strips and rivets used in repairing make the pulley heavier on one side than the other, which throws it out of balance. If the pulley

FIGS. 9 AND 10—ALL PARTS CLAMPED AND RIVETED

With the parts mounted the holes are lined up and rivets inserted and peened over, thus fastening all parts rigidly.

FIGS. 11, 12, 13 AND 14—DRESSING UP SURFACE AND BALANCING THE PULLEY
Filing the surface is important so that the belt will run true. Balancing the pulley is the next step. This is done by placing a temporary weight on the pulley to locate where weight must be added to create balance

is used on high-speed work, this may be the reason for vibration and jerking of the machine.

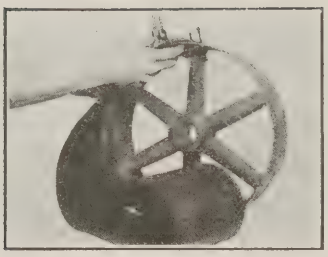
A pulley is said to be in standing or static balance when its center of gravity coincides with the axis upon which is revolves. A pulley may be in standing balance and not in balanced state when running at high speed. This is known as running balance. The exact position of the heavy section should be located and the balancing effected either by reducing the weight of the wheel or by adding counterweight opposite each section and in the same plane at the proper radius; but if the rotating part is rigidly mounted on a stiff shaft, a running balance that is sufficiently accurate for practical purposes can be obtained by means of comparatively few counterweights located with reference to the unbalanced parts.

To do this the most simple method that has been developed in the commercial shop is to level carefully with a parallel bar, as shown in Fig. 12. In this job long bolts of $\frac{5}{8}$-in. diameter have been substituted for the commercial parallel. They can be used with about the same guarantee of accuracy as is expected from the parallel bar, and, of course, will eliminate the necessity of borrowing or buying the standard parallel bar. In leveling up a job as shown here be sure that the rods are on the same plane. This can be determined by placing a straight edge across the two bolts and adjusting to a level. Washers, paper, tin, shangles, etc., are a few objects for blocking up material. They may be used when bringing the rods to an accurate horizontal plane surface.

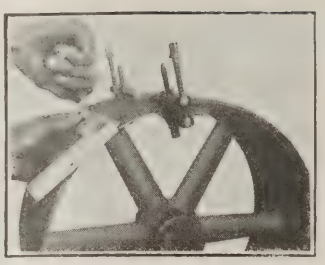
After the parallel ways have been provided and leveled, an accurate shaft or mandrel is inserted through the bore of the pulley. It should be understood that this must fit snugly. The job is then placed on the bolts as shown in Fig. 13. If the pulley is in an unbalanced state it will turn until the heavy side is downward. If the center of gravity of the pulley coincides with the center of the shaft there will be no movement, but if the center of gravity does not coincide with the center of the shaft the shaft will roll until the center of gravity of the wheel comes directly under the center of the shaft or until the heavy side of the pulley is downward. The center of gravity may be brought to the center of the shaft by adding or taking away weight at proper points on the pulley. The simplest way to do this is to make up a plastic mass of clay or mud and apply this to the light side of the pulley, as shown. This acts as a counterweight, and when the proper amount has been placed it should be possible to revolve the pulley in either direction or in any position, and the shaft and pulley should remain stationary when the hand is removed.

A chalk line is made to indicate the center of the clay counterweight. The mud or clay can now be removed from the pulley and weighed. A counterweight of equal weight made from steel can be secured and riveted in place, as shown in Fig. 14. It is best after the new counterweight has been placed to try out the job for balance before riveting in place.

Many belt drives on mine machines give considerable trouble in keeping them on the pulleys. In a heavy pull the belt often leaves the pulley. This may be caused by not having the shafts parallel. The belt will always run toward the "low side" of the pulley—on the side where the centers of the shaft are closest. It is obvious that the friction of leather on leather is much greater than of leather on iron or steel. Leather-covered pulleys will transmit considerable more power than plain, uncovered pulleys for the same belt tension. The slippage can be considerably eliminated. In covering a pulley with leather the grain side of the leather should be on the outside.



If the shafts are checked and found parallel and the belt continues to leave the pulley the trouble may be remedied by crowning the pulley. The crowning of a pulley tends to keep the belt on only when the belt as a whole does not slip. A slipping belt will run off a crowned-faced pulley quicker than from a straight-faced pulley. If this fails to accomplish the desired results the pulley face should be covered with leather to eliminate the slippage which causes the difficulty since all the other schemes failed.



It should be understood that creeping is due to the tension element and must not be confused with the slip due to insufficient frictional grip on the pulley. To increase the frictional grip of a belt the belt manufacturers instruct all users of leather belts to run the grain side to the pulley. It is claimed that 33 per cent more power can then be transmitted than with the flesh side to the pulley. The grain of the leather has a velvety surface which enables it to hug the pulley closer than the hard-flesh side.

In covering a pulley two common methods are employed: the glued endless cover and the riveted cover. To put on a glued endless cover select the leather which is to be used on the job, make the cover endless and about $\frac{1}{8}$ in. to the foot shorter than the circumference of the pulley. This is done in the same manner as you

FIGS. 15 AND 16—MAKING THE LEATHER SOFT FOR MOUNTING ON THE PULLEY RIM
Softening the leather generally will aid in fitting it to the pulley. Light hammering also will make the leather more pliable.

FIGS. 17, 18, 19 AND 20—SURFACING THE PULLEY WITH LEATHER
The leather covering is next applied to the pulley by rivets. The heads of the rivets should be on the outside. The ends of the leather facing should be made to meet so as to form a smooth joint.

would glue a belt. The face of the pulley should next be thoroughly cleaned with gasoline. The endless cover is then slipped or driven onto the pulley about an inch. An application of cement is then applied. After applying the glue the cover is driven in place by lifting the pulley and striking the cover edge on the bench or floor. This should be done as quickly as possible, as the cement has a tendency to set.

A good formula for a cement to fasten leather to iron is as follows: Paint the iron with some kind of lead color; say, white lead and lampblack. When dry, cover the cement as follows: Take 1 oz. of the best glue, soak it in cold water till soft, then dissolve it in 1½ fl.oz. vinegar with a moderate heat, then add one-third of the bulk of white pine turpentine, thoroughly mix and by means of the vinegar make it of the proper consistency to be spread with a brush. Apply it while hot. After the cover is driven in place a hammer handle should be used to rub out all the air pockets between the leather and the rim of the pulley. To do this job this way requires considerable time and practice. It is not recommended for the mine shop, but may come in handy some time. This principle can, of course, be applied to several other types of repair jobs.

The easier way to cover a pulley is to rivet on the covers. This is done by first cutting the leather facing to 1 or 2 in. longer than required, and it does not complicate the job if it is a little wider. This leather facing can be made from old leather belts, in fact any leather stock that has the necessary size to cover the pulley. To soften up the leather and make it pliable so that it will fit snugly on the pulley it is advisable to soak it in water, as illustrated in Fig. 15, for an hour or more. It is then removed and hammered out, as in Fig. 16. This operation is not absolutely necessary, but if the belt is stiff and dry before it was placed in the water bath the hammering has a tendency to make the leather more flexible and pliable. The leather facing is next clamped to the pulley as shown in Fig. 17.

The job is now ready to be drilled to receive the copper rivets. The rivet is measured and the proper drill selected (Fig. 18). The drill should be just a trifle smaller than the rivet. This will make a drive fit and insures a much better job. Holes are first drilled through the facing and the pulleys on each side and at the end. They should be drilled about ¾ in. from the edge of the pulley. A rivet is then placed with the head on the outside in each of these holes and fastened down. This holds the end securely in place. The clamps are then removed and clamped about 4 in. from the rivets.

The facing or covering is then hammered over the surface between the rivets and the clamps. This is done to stretch it evenly over the surface of the pulley. The drilling and placing of rivet is repeated, and the clamps are again changed. This procedure is followed until rivets have been placed entirely around the pulley. The number of rivets required must be decided upon by the repairman. It is not necessary to have them any closer than necessary to prevent buckling of the cover.

To make the ends meet closely before the last two rivets are placed, the cover is cut in length as shown in Fig. 19. After this is done the last two rivets are placed. The edge is now trimmed as in Fig. 20, which completes the work.

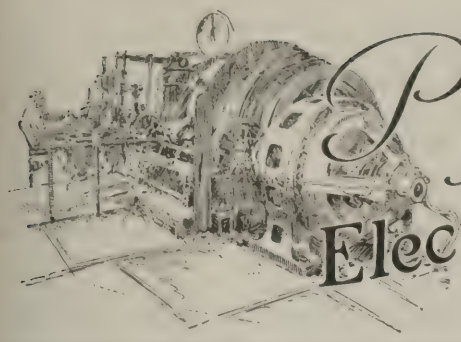
Reviews Work of N. J. Fuel Commission

In a report to Governor Silzer of New Jersey, Wm. T. Grier, chairman of the New Jersey Fuel Commission, on May 24 reviewed the work of the commission during the eight months ended April 1. He pointed out in particular that despite the shortage of domestic sizes of anthracite last winter the State of New Jersey received 25 per cent more than its original share, which was 60 per cent of the total received the previous year. It was pointed out that there was no shortage of bituminous coal in the state and that the total cost of the New Jersey commission's work was $4,000. In conclusion, the report states:

"Congress adjourned without doing anything to avert a similar shortage in the future, except by providing for the appointment of another Fact-finding Commission that will probably report to the next session of Congress.

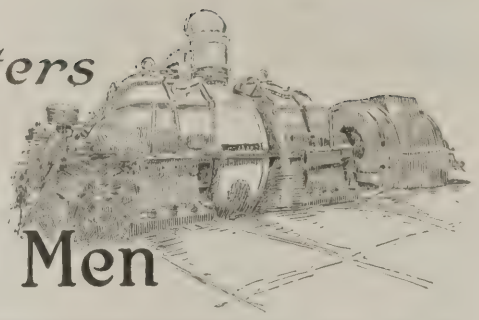
"Our own Legislature adjourned in like manner without doing anything.

"The State of Pennsylvania, which absolutely controls the anthracite situation, has up to date done nothing to avert a repetition of the conditions of last year, and its Legislature, which meets biennially, will adjourn at an early date.



"The Interstate Commerce Commission has done nothing toward an adjustment of coal-carrying rates, which our experience indicates are grossly excessive in our state; nor has it attempted to penalize coal-carrying roads, which in some instances ignored the commission's orders during the shortage period.

"The agreement between miners and operators, under which mining was resumed on Sept. 15, 1922, will expire Aug. 31, 1923, and up to date no effort appears to have been made to secure a renewal.



"Several railroads are storing vast quantities of coal for their own use. Whether or not they have inside information as to the probability of another shortage resulting from a strike, is not disclosed."

DR. RICHARD B. MOORE, chief chemist of the U. S. Bureau of Mines, has resigned, to take effect June 1. He will be succeeded by Dr. Samuel C. Lind, who has for some years acted as a superintendent of the Rare and Precious Metals Experiment Station of the bureau at Reno, Nev. Dr. Moore will enter the commercial field with a well-known firm of consulting chemists and metallurgists in New York City.

R. H. GROSS, OF BOSTON, has been made a member of the Bituminous Operators' Special Committee to serve during the absence of J. G. Bradley. Mr. Bradley expects to make an extended European trip.

Practical Pointers for Electrical and Mechanical Men

What Determines the Speed of An Induction Motor?

I HAVE been greatly interested in your pages under the heading "Practical Pointers for Electrical and Mechanical Men," and have found a great deal of information in them. I am glad to see the explanations you have been publishing of fundamental and more advanced application of electricity as used in coal mining.

Will you kindly give an explanation in your columns of what determines the speed of an induction motor at no-load. Confusion frequently arises in my mind when speaking about the speed of an induction motor. For instance, I sometimes hear of an induction motor of 690 r.p.m. and then again the same motor is sometimes called a 695-r.p.m. motor, while sometimes it is even called at 720-r.p.m. motor.

The no-load speed of an induction motor is determined by the frequency of the supply circuit and the number of poles in the motor. This represents the normal no-load speed of the motor when across the line and all speed control equipment has been cut out. The full-load speed will be from 4 per cent to 8 per cent slower, depending upon the design of the motor.

Knowing the frequency of the circuit and the number of poles into which the winding has been arranged the speed may be calculated from the following formula:

$$R.P.M. = \frac{120 \times frequency}{no.\ poles}$$

This gives the no-load or synchronous speed, which always is slightly higher than the actual no-load speed. This slight difference is due to the principle of the motor; a small difference between the synchronous speed and actual no-load speed is necessary for the motor to operate.

Induction motors frequently are designated by the number of poles in the winding and the frequency of the circuit rather than by a particular no-load speed, which is a slightly variable quantity in all motors.

The following table derived by use of the above formula will assist in pointing out the relation between frequency, poles and speed:

	SYNCHRONOUS SPEED		
Poles	60 Cycles	40 Cycles	25 Cycles
2	3,600	2,400	1,500
4	1,800	1,200	750
6	1,200	800	500
8	900	600	375
10	720	480	300
12	600	400	250

How Big a Load Can a Locomotive Haul?

WHAT is the method of calculating the haulage capacity of electric locomotives? Is there any simple table which would show the haulage capacity on various loads? I am merely interested in knowing how many cars or, in other words, what trailing load may be attached to a locomotive and hauled efficiently.

W. VIRGINIA.

The haulage capacity of a locomotive depends upon many important factors, principally among which is the condition of the equipment—in particular, the locomotive, the cars and the track. Friction of the bearings, track friction, curves, grades, gear ratio and air resistance also are important factors, and without any definite knowledge of these quantities only an estimate can be made. For the average condition the following assumptions can be made and the table appended probably will give a fair idea of the haulage capacities of various sizes of locomotives.

The rated drawbar pull of a locomotive equipped with cast-iron wheels is 20 per cent of its weight; when equipped with steel wheels it is 25 per cent of its weight.

Assuming the locomotive to be equipped with steel wheels and the coefficient of friction to be 30 lb. per ton on a level track and 20 lb. per ton for each per cent of grade, the following table may be constructed

TABLE GIVING LOCOMOTIVE DRAWBAR PULL AND HAULAGE CAPACITIES

Locomotive Weight, Tons.	Level Track		1 Per Cent Grade		2 Per Cent Grade		3 Per Cent Grade		4 Per Cent Grade		5 Per Cent Grade		6 Per Cent Grade	
	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons	Drawbar Pull, Pounds	Haulage Capacity, Tons
3	1,500	50	1,440	29	1,380	20	1,320	15	1,260	12	1,200	9	1,140	8

and used as a guide. If the locomotive is equipped with cast-iron wheels the values will be 80 per cent of those shown in the table.

Eliminating the Noises from Mine-Telephone Circuits

I HAVE just encountered a problem pertaining to telephony in a coal mine which I believe would be very helpful to engineers operating a telephone system under the same conditions. The problem follows:

At the Rich Hill mine of the McClane Mining Co. a telephone circuit is run through the length of the mine—3 miles—in parallel with a 250-volt traction circuit. The average distance between the two circuits is 10 ft. Lately the telephone circuit has been giving very inefficient service, due to excessive receiver noises in all phones in the mine.

At first I followed the circuit, thinking that the telephone wires might be lying on the trolley circuit at some crossover or that the wires might be too close to the trolley circuit. But a thorough inspection failed to place the cause of the trouble as such.

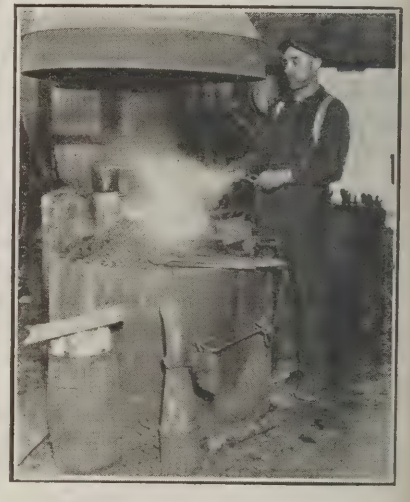
The only possible cause left then was in the insulators. It was concluded that a leakage current—present in most all damp coal mines—found a path through a broken-down telephone insulator, followed the telephone circuit and caused the receiver noises. However, as the spacing was considerable, this did not seem to be the cause.

As we have no insulation resistance measuring instruments or devices, no definite insulator could be tested and found to be broken down. The only method of eliminating bad insulators was by observation. When a cracked insulator was found it was replaced. Or when a wire was almost eaten through—probably caused by the leakage current flow through that insulator—the insulator was discarded. After a number of insulators were replaced, the system was greatly improved, the noises being much reduced.

As this trouble that I experienced is unusual, I hope it will be of interest to engineers operating telephone circuits in a mine where the circuit is in parallel with a traction circuit, especially in damp mines where high leakage currents are present. W. G. HAGESTEN.

Meadowlands, Pa.

Noises in mine-telephone systems may be broadly classified into three main groups—namely, faults in the equipment, induced currents and leakage currents.



Defects in equipment may be due to many causes, such as moisture, incorrect assembly, grounds, short-circuits, etc., in the telephone. These difficulties may easily be eliminated by carrying on hand a spare telephone, which may be installed and the defective one repaired. By such a plan the telephones may be kept in good operating condition at all times, the spare telephone always being the last one returned for repairs.

Induced currents may be present due to the telephone circuit paralleling an alternating-current or direct-current circuit; a fluctuating load on a direct-current system will at times cause considerable noise. The closer the telephone circuit is to any other line the greater will be the induction. The most common practice used to prevent induction is the transposition of the telephone line wires. This is an interchange of position of the telephone line wires every 20 to 50 ft. Another method is the use of a twisted pair of wires for the telephone circuit.

Leakage currents will cause considerable noise whenever they travel over any section of the telephone circuit. In mine work these leakage currents are primarily due to grounds on the telephone wires. These grounds may be at insulators, on the wires between insulators or on switching equipment on the line. Leakage currents may enter a line at one point and later leave at another, especially where the insulation has become broken or the insulators are damp and dirty. Leakage currents may at times find their way into a telephone circuit a considerable distance away from the trolley wire; this is due to the return circuit of the trolley system being grounded and the return current selecting any path which presents a low resistance.

An Easy Way to Wet Down a Forge Fire

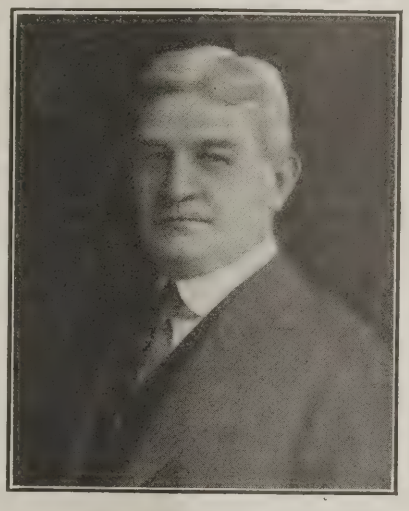
AN OLD saying goes, "Habit makes cowards of us all," and there is much truth in these few words. Because of habit one frequently does routine work mechanically, with little mental exertion to suggest how it might be more efficiently accomplished. Thus, many of the methods of the blacksmith about the mines have been handed down through several generations without modification. Consequently it is not surprising to observe that most blacksmiths still adhere to the old method of wetting down the outer region of the fire on the forge by dipping water by means of a tin can from the tempering barrel and pouring it around the fire in an irregular stream

WETTING THE FIRE MADE EASY AND SAFE

This simple and efficient method gives an even distribution of the water and permits the control of wetting without the steaming and burning that frequently occurs when the old method is employed.

How much better is the method pictured in the accompanying illustration! It is the one employed by a blacksmith in the shop of the New Field By-Products Coal Co., at North Bessemer, Pa. The bottom of a heavy tin can is punctured with holes so as to form a sieve, and is suspended in a trunnion handle. When not in use the can rests on the bottom of the tempering barrel with the grip projecting above the surface of the water. The fire is wetted down evenly, giving a more uniform heat, and the operation is accomplished by the blacksmith standing erect and away from the fire.

COAL PRODUCED DURING 1922 IN QUEENSLAND, Australia, totaled 958,519 tons as compared with 954,763 tons in the previous year, according to the report of Henry Marshall, Under Secretary for Mines. The output of coke in the Ipswich district was 5,265 tons as compared with 7,557 tons in 1921. Mr. Marshall says that depression in the coal trade necessitated closing down several of the mines in the Ipswich district, which affected the output of coke materially. In this district during the year two coal-washing and cleaning plants were in operation and another started operations early this year. One of these plants has a laboratory for testing the quality of the products of the washer.



H. M. Griggs Explains How the Ore & Coal Exchange Handles Lake Coal Traffic

In an address on "The Transportation of Lake Coal," before the convention of the International Railway Fuel Association, May 22, at Cleveland, H. M. Griggs, manager of the Ore & Coal Exchange, Cleveland, prefaced his remarks with the statement that the subject was of such magnitude and interest that in a single paper one could hope to deal with it in only a brief and general way.

"Bituminous coal," said Mr. Griggs, "has been shipped from ports on Lake Erie by vessels to destinations on the Great Lakes for considerably more than half a century. For a number of years the tonnage was quite small, gradually increasing until in 1896 the total was 4,000,000 tons. By 1905 it had grown to 10,000,000 tons and in 1910 to 20,000,000 tons. In 1913 the tonnage reached 26,800,000, and the same amount was moved in 1917. The maximum was reached in 1918, the war year, when 28,153,000 tons of bituminous coal were transshipped by vessels from Lake Erie ports.

"The first general pooling of Lake coal was in June, 1917, the pool being operated during the season of 1917 as the Lake Erie Bituminous Coal Exchange. Before the opening of navigation in 1918 the pool was reorganized and operated by the railroads, Lake coal shippers, vessel people and ore shippers jointly under the title of Ore & Coal Exchange.

"After the close of the 1918 season the pooling of Lake coal was discontinued. The Ore & Coal Exchange was continued by the U. S. Railroad Administration, then operating the railroads, for the season of 1919. When the carriers were turned back to private ownership in March, 1920, all of the railroads interested in the coal and ore traffic to and from Lake Erie ports continued the organization and have since operated it at their expense.

H. M. GRIGGS
Manager Ore & Coal Exchange, Cleveland

"The purpose of the Ore & Coal Exchange is to facilitate the handling of the Lake coal and ore traffic; to expedite the release of cars loaded with Lake coal and to provide a sufficient supply of cars for ore loading as vessels arrive at Lake Erie ports. If the ore and grain cargoes were unloaded promptly and regularly there would be no supply of boats for the upbound coal loading, so the handling of the ore cargoes is an intimate part in providing vessels for and in the movement of Lake coal.

"Cleveland is the headquarters of practically all of the Lake coal transshippers, the vessel fleets and the ore shippers, the few not located there having branch offices to look after the Lake traffic. The Ore & Coal Exchange assembles reports each morning from all of the coal docks and ore docks, giving full information to Lake coal shippers and vessels as to the coal at port and due within the following four 12-hour periods, and shows the boats unloaded during the previous 24 hours, at the ore docks at 7 o'clock each morning and due during the next three 24-hour periods. In short, the reports from the docks and from the superintendents' offices of the railroads of the coal in transit are centered in the Exchange, as well as similar reports covering the ore movement, so that, with a complete picture of the Lake situation before the Exchange, the Lake coal shippers and the vessel people, boats will be provided at the time sufficient coal reaches port to complete the cargo.

"This centralization and co-operation of the coal shippers and railroads and vessel interests has greatly reduced the time it has taken to release and unload the coal cars at Lake ports and return them to the mines for loading, as well as to give better dispatch to vessels in loading coal and unloading ore.

"The transportation of Lake coal may be separated into two parts: First, the rail transportation to Lake ports and the dumping into vessels; second, the transportation by vessels from Lake Erie ports and the unloading onto the destination docks.

"When a boat has been named and the time it will be due at the port determined the coal is switched to the smaller yards at the docks where the machines are located that dump the coal into the vessel when it arrives. When the vessel is up to the machine ready to load, the cars are run onto the platform of the dumper, one car at a time. The machine lifts the car from 10 to 20 ft., as conditions require, and turns the car over, emptying its contents into a pan which permits the coal to run slowly through a cylindrical chute called a telescope, which is movable and by which the operator can turn the stream of coal to either side or part of the vessel desired within range of this telescope arm. This pan and telescope arrangement is to let the coal down easily into the hold of the vessel and thereby reduce breakage of coal to the minimum and also to trim the loading of the vessel. The largest of these dumping machines have a capacity to lift and turn over 40 to 44 cars per hour and will handle cars up to 100 tons capacity. We have 20 of these machines at Lake Erie ports for dumping bituminous coal, all but 3 of which are now in operation.

"As the occasion requires, the extra machines are put into service. The maximum dumping capacity of these machines is 375,000 tons per 24-hour day. The actual maximum dumping in one day at all ports was 4,401 cars, performed on Oct. 9, 1918. This was a total of 225,000 tons loaded into 27 vessels. These machines have dumped into vessels for cargo and bunker 1,453,684 tons in a week—the week of Sept. 25, 1922—and 5,043,887 tons in one month, the month of October, 1918.

"In 1922, when all mines north of the Ohio River were shut down for five months of the Lake season, April to August, there were forwarded during the months of September, October and November 12,852,000 tons, showing the capacity of the dumping machines as well as the railroads and the Lake fleets to handle large volumes of traffic when the emergency arises.

"This cargo coal goes to all the principal ports on Lake Superior and Lake Michigan, Georgian Bay, the ports on rivers and lakes from the Sault to Lake Erie and to ports reached through the Welland Canal and the St. Lawrence River, principally Montreal, to which point the tonnage is quite heavy, being used for railroad fuel, gas making, manufacturing, fueling river and ocean vessels and for domestic purposes.

"Lake coal is handled in bulk freight vessels of varying capacity, the larger running from 5,000 to 15,000 tons capacity. Vessels on the Great Lakes of less than 5,000 tons capacity are few in number and extremely small in proportion to the total capacity. At the opening of the season of 1923 the bulk freighters engaged in the coal, ore, grain and stone handling on the Great Lakes was 487, with total carrying capacity of around 3,500,000 tons per trip, depending upon the stage of the water in the rivers, channels and harbors. Four hundred and one of these vessels are of American registry, belonging to 33 fleets, and with one or two exceptions are all steel vessels.

"The aggregate carrying capacity for a season depends upon a number of factors: weather conditions, stage of water and dispatch in loading and unloading. The latter is

contingent upon promptness in receiving and discharging cargoes and is the most important factor, affecting the total carrying capacity of a vessel during the season more than any other item. The fleets of vessels on the Great Lakes, in my opinion, are the most highly efficient transportation facility on this continent. They handle more freight in a given time than any other transportation agency of like size and at freight rates that are so much less than the rail rates for equal distances that there is no comparison.

"The rates on ore from the head of the Lakes to Lake Erie, an average distance of something like 880 miles, runs from 70c. to 80c. per gross ton; the rate on coal from Lake Erie ports to Lake Superior ports is from 40c. to 45c. per net ton and to Lake Michigan ports from 50c. to 55c. per net ton. The rates on grain vary considerably from time to time during the seasons. From ports on Lake Superior and Lake Michigan to ports in Georgian Bay and in Lake Erie during 1922 they ran from 1¾c. to 5½c. per bushel, although higher rates than the latter figure were paid at times of scarcity of available vessels. An average rate from Lake Superior to Lake Erie of 3.42c. is reported for the season.

"The Great Lakes fleets carried during the last big season, that of 1918, 114,614,000 net tons of ore, coal, grain and stone. This was carried practically in 7 months and is as great a tonnage as is handled by many of the large trunk lines in twelve months. The ton-miles of the traffic handled in the bulk freight boats on the Great Lakes has been estimated at 92,000,000,000 ton-miles, which is about one-fourth of the total annual ton-miles for freight handled on the rail carriers of the country.

Fleets Meet War Emergency

"These great fleets have met every emergency. In 1917 there was a tremendous movement of ore and coal and in addition they were called upon to move an unheard-of volume of wheat late in the fall to supply the armies of the Allies in France. It took until Christmas Day in 1917 before the last vessel was in port; but they did what the government asked of them after battling almost constantly through ice from Lake Superior to Lake Erie.

"In 1918 the various war boards laid out a program on account of war requirements that was greater than any ever contemplated on the Lakes in any previous season. Notwithstanding the fact that the fleet was smaller than in previous season because a number of vessels had been taken out of the Lakes to the sea coast, all that was set up to be done was fully accomplished.

"In 1920, when the Northwest was in great distress over its winter's coal supply and appealed to Washington so vigorously that the Interstate Commerce Commission arbitrarily required the shipment of 4,000 cars—200,000 tons—of coal to the Lakes daily, to accomplish a total movement of 20,000,000 tons up the Lakes after Aug. 1, the vessels prepared to move it and did so to the full extent that they were called on to meet all the requirements of the Northwest docks.

"In 1922 the strike of the coal miners held back the Lake movement until about Sept. 1. The fleets were called on to handle over 13,000,000 tons from Labor Day to the end of the season. By organization, co-operation and co-ordination of every factor through the Ore & Coal Exchange the movement was fully completed before the season closed.

"The estimate of the traffic to be moved on the Lakes during the season of 1923, made prior to the usual time of opening of navigation was: Iron ore, 60,000,000 tons; bituminous coal, 25,000,000 tons; anthracite, 3,500,000 tons; fluxing stone, 9,500,000 tons; grain, 15,000,000 tons, a total of 113,000,000 tons.

"The unusual weather and ice conditions prevailing this spring much later than customarily, have delayed vessels and the movement of Lake traffic to such an extent that boats will not be running in a regular way before June. The later opening has cut down the carrying capacity of the fleets at least 10 per cent, and the reduced draft caused by low water stages in the channels, rivers and harbors likewise has reduced the carrying capacity of the fleets estimated, if this condition prevails throughout the season, at another 10 per cent.

"To give a better idea of the trip capacity of the Lake vessels and the rapidity of Lake transportation the following record cargoes and operations will be interesting: During the season of 1922 the Steamer 'Col. J. M. Schoonmaker' handled in one trip 14,336 tons of iron ore down and 14,500 tons of soft coal up on another trip. In the season of 1919, when the stage of water was more favorable, the Steamer 'D. G. Kerr' carried 15,532 tons of soft coal, and the 'W. Grant Norden,' a Canadian vessel handled 15,500 tons. The record of loading ore into vessels was made by the Duluth & Iron Range dock, Two Harbors, Minn., Sept. 7, 1921, when there were loaded into the Steamer 'D. G. Kerr' 12,508 gross tons of ore in 16½ minutes. This same cargo made the unloading record at the Bessemer & Lake Erie dock at Conneaut, Ohio, on Sept. 12, 1921, when the 12,508 gross tons of ore was lifted out of the vessel and loaded into cars in 3 hours and 5 minutes, or, at the rate of 4,056 tons per hour. The best record of loading vessels with soft coal is 13,976 tons of cargo and 369 tons of fuel in 4 hours and 30 minutes.

"When a vehicle of transportation can receive 14,000 tons of coal, transport it 880 miles, unload it, reload 14,000 tons of ore, transport it 880 miles, unload it, and perform all this in 192 hours, or exactly 8 days, there is no transportation and handling in the world that can be compared with it. Of course, this is not always the regular performance, but shows what has been done and could be possible under perfect conditions.

"Railroad transportation involves the haul of the coal from mines in the Pittsburgh and Connellsville districts of western Pennsylvania; the Fairmont, Pocahontas, New River and Kanawha districts of West Virginia; from mines in eastern Kentucky and in Ohio to the Lake ports.

"The coal at port on Monday morning of this week [May 21] was 14,347 cars and in the 48-hour transit report 5,601 cars, total of 19,948 cars. Back of coal shown in transit there is practically 5,000 cars moving from the mines to the scales or division points where the coal begins to show in the transit report. This means about 25,000 cars of coal under load daily with Lake coal. The amount of coal at port on Monday mornings is greater than other mornings in the week, the average coal at port should run around 10,000 cars. We dumped into vessels last week [May 14-19] notwithstanding the fact that we had bad weather conditions to contend with during two days of the week, 20,317 cars, or an estimated total of 1,035,000 tons, 46,000 tons of which was vessel fuel, thus bringing the total dumping of cargo and bunker fuel for the season up to 3,540,000 tons.

"The average loading of Lake coal prior to the season of 1922 was generally about 50 tons per car, but with increasing numbers of 70-ton cars and 100-ton cars the average loading per car is growing greater, and will run this season, from present indications, about 60 tons per car.

"All of this Lake traffic must be handled by the railroads within a season of practically seven months. In order to do this it is necessary to dump into vessels at Lake Erie ports an average of 3,000 cars of Lake coal and to furnish cars for and haul away an average of 5,000 cars of iron ore per day during the season. This necessitates the railroads operating days, nights and Sundays throughout that period.

"The railroads have a large undertaking to handle the 26,000,000 tons of Lake coal, including 1,000,000 tons of bunker coal furnished the vessels, and the 35,000,000 tons of iron ore during the season of seven months. In the emergencies the railroads have responded as wonderfully as did the vessels. Considering all the unfavorable conditions that have confronted the railroads they have made a splendid record in handling this Lake traffic for the past half dozen seasons and we hope for and expect no less satisfactory service this season."

Production of Coal in the State of New South Wales, Australia, during 1922 was 10,183,133 tons, according to A. Simpson, British Trade Commissioner at Sydney. This compared with 10,793,387 tons in 1921, a decrease of 610,254 tons. The making of coke was handicapped by the diminished smelting operations at Newcastle and Lithgow, production amounting to 240,229 tons, as compared with 592,097 tons in the previous year. There were 21,634 persons employed in the production of coal and coke, an increase of 369 over 1921.

Daily Output of Both Byproduct and Beehive Coke Higher in April

Output of byproduct coke in April, according to the Geological Survey, showed a slight decrease. The total production for the month was 3,206,000 net tons, against 3,256,000 tons in March. The fact that there was one less working day in April was responsible for the decline, as the average daily rate of production increased from 105,000 to 107,000 tons. The quantity of coke actually produced was 88.7 per cent of the capacity of the plants in operation, a percentage that compares favorably with that in preceding periods when demand for coke has been most active. Of the 70 byproduct plants, 64 were active and 6 were idle. One plant that has produced no coke for many months was reported permanently abandoned and being dismantled.

Unlike byproduct coke, the production of beehive coke increased slightly. The total output was 1,776,000 net tons, against 1,749,000 tons in March. It is of interest to note that of the total output of all coke, 64.4 per cent was contributed by byproduct plants and 35.6 per cent by beehive ovens, whereas in 1920 59.5 per cent and 40.5 per cent, respectively, were furnished by the two branches of the industry.

The present rate of production of all coke—4,982,000 tons—exceeds the average monthly rate in 1920 by 669,000 tons, or 15.5 per cent

MONTHLY OUTPUT OF BYPRODUCT AND BEEHIVE COKE IN THE UNITED STATES *a*

(In Net Tons)

	Byproduct Coke	Beehive Coke	Total
1917 Monthly average	1,870,000	2,764,000	4,634,000
1918 Monthly average	2,166,000	2,540,000	4,706,000
1919 Monthly average	2,095,000	1,638,000	3,733,000
1920 Monthly average	2,565,000	1,748,000	4,313,000
1921 Monthly average	1,646,000	462,000	2,108,000
1922 Monthly average	2,374,000	669,000	3,043,000
February, 1923	2,810,000	1,482,000	4,292,000
March, 1923	3,256,000	1,749,000	5,005,000
April, 1923	3,206,000	1,776,000	4,982,000

(*a*) Excludes screenings and breeze.

To manufacture the coke produced in April it is estimated that 7,408,000 tons of coal was consumed, of which 4,607,000 tons was used in byproduct ovens and 2,801,000 tons in beehive ovens. From the table below it will be seen that the present rate of consumption is 16.7 per cent more than the average monthly rate in 1920, and 4.5 per cent more than that in 1918, when demands for war-time purposes were at their height.

ESTIMATED MONTHLY CONSUMPTION OF COAL FOR MANUFACTURE OF COKE *a*

(In Net Tons)

	Consumed in Byproduct Ovens	Consumed in Beehive Ovens	Total Coal Consumed
1917 Monthly average	2,625,000	4,354,000	6,979,000
1918 Monthly average	3,072,000	4,014,000	7,086,000
1919 Monthly average	2,988,000	2,478,000	5,466,000
1920 Monthly average	3,684,000	2,665,000	6,349,000
1921 Monthly average	2,401,000	706,000	3,107,000
1922 Monthly average	3,411,000	1,056,000	4,467,000
February, 1923	4,037,000	2,339,000	6,376,000
March, 1923	4,679,000	2,759,000	7,438,000
April, 1923	4,607,000	2,801,000	7,408,000

(*a*) Assuming a yield in merchantable coke of 69.6 per cent of the coal charged in byproduct ovens, and 63.4 per cent in beehive ovens.

Fuel Economy in Self-Firing

That human nature is the same in the army as in any other walk of life is clearly shown in a study made during the past year by the construction service of the Quartermaster Corps to determine what saving could be made by more efficient use of coal and wood at the various posts and stations where regular troops are on duty.

The records now indicate that the least coal is used where individual stoves are installed, and the most burned in central heating plants which care for the same number of people. Individual steam and hot-water plants come between these limits. As the construction service statement points out, "It compels the inference that the least coal is used when people have to fire for themselves."

This review of fuel allowances has borne great fruit in economy. One Western post had its allowance reduced 3,000,000 lb. from the amount used in 1921 and 2,000,000 from previous allowances. An Eastern post was reduced 1,000,000 lb.

Fuel for the army cost $10,274,502.19 in 1921, and in 1922 this amount was reduced to $5,877,897.98, a saving of $4,396,604.21.

British Columbia Coal Mining Grows Slowly

Coal mining in British Columbia is on a slow increase. The total coal production for the province in 1922 was 2,511,843 gross tons, valued at $12,559,215, making the aggregate for the province from the year 1836 approximately 59,205,333 gross tons with an estimated value of $213,768,998. The coke production for 1922 was 45,835 tons, valued at $320,845. This brings the total provincial coke production since 1895 to 4,228,536 tons, valued at $24,520,567. The coal output of last year was 27,848 tons in excess of that of 1921 and, with the exception of 1920, was greater than that of any previous year since 1912. The coke production of last year fell short of that of the previous year by 13,599 tons.

British Columbia's coal production for the years 1921 and 1922 may be summarized as follows:

	1921	1922
Vancouver Island Mines	1,625,931	1,754,656
Nicola and Similkameen Mines	183,153	270,890
Crow's Nest Mines	759,755	554,361
Omineca-Telkwa	800	1,008
Total quantity coal mined	2,569,639	2,580,915
Less made into coke	85,644	69,072
Net quantity of coal produced	2,483,995	2,511,843

Seventy-two per cent of the gross production of 1922 was mined by three companies, viz., the Crow's Nest Pass Coal Co., East Kootenay; the Canadian Collieries (D), Ltd., and the Western Fuel Corporation, the two latter of Vancouver Island. Other collieries figured as follows: Pacific Coast Coal Mines, Ltd., now in liquidation, mined no coal but recovered 4,752 tons of slack from one of the old dumps at the Morden Mines; the Nanoose Collieries, Ltd., produced 99,049 tons; the Granby company, from its collieries at Cassidy, V. I., produced 276, 919 tons; and King & Foster, operating at the Old Wellington, V. I., produced 9,148 tons. In the Nicola Valley section the Middlesboro Colliery Co. mined 69,330 tons; the Fleming Coal Co., 38,485 tons; the Princeton Coal & Land Co., 19,418 tons, and the Coalmont Colliery, 142 806 tons. In the East Kootenay, in addition to the Crow's Nest Pass Coal Co., which produced 508,339 tons, the Corbin Coal & Coke Co. had an output of 46,022 tons.

A new coal field has been opened up in the Omineca, northern British Columbia, where two small collieries are being developed on the Telkwa River. The Aveling Coal Co. shipped 669 tons last year while the Telkwa Collieries contributed 339 tons.

Canada's 1922 Coal Output Is 2 Per Cent Below Previous 3-Year Average

The Dominion Bureau of Statistics states that the output of Canadian coal mines in 1922 was 15,045,300 short tons, which is 2 per cent below the average of three previous years of 15,307,800 tons. Exports of Canadian coal were 1,818.582 tons, 82 per cent of the three-year average of 2.205,049 tons. Coal made available for consumption in Canada totalled 27.482,300 tons, a decrease of 14 per cent from three-year average of 31,736,800 tons.

11,359,000 Barrels of Portland Cement Produced During April

Production of portland cement during April, 1923, according to the U. S. Geological Survey, totaled 11,359,000 barrels, compared with 9.243,000 barrels in the corresponding month of 1922 and 9,880,000 barrels in March, 1923. Shipments for the month were 12,954,000 barrels, against 8,592,000 barrels in April a year ago and 10,326,000 barrels in March, 1923. Stocks at the end of April were 11,450.000 barrels, compared with 14,470,000 barrels at that period in 1922 and 13,045,000 barrels at the end of March, 1923.

Problems of Operating Men

Edited by James T. Beard

Failure of Fireboss Cannot Be Ascribed to His Lamp

Careless Acts of Firebosses Often Cause Disaster Attributed to Failure of Safety Lamp—Exact Information Too Often Lacking

WITH more than ordinary interest, I read the letter of W. H. Moore, *Coal Age*, Jan. 25, p. 184, entitled "Relative Safety of Safety Lamps Under Varying Conditions in Mines." The letter gave a brief description of an explosion that occurred in the Wakesiah mine, Nov. 24, 1922, and which cost the lives of the fireboss and a pumpman.

From first to last, there has been much said in *Coal Age*, in regard to the use and safety of the testing lamp in coal mines. Having had a long experience in the use of the Wolf testing lamp, I consider it safe if properly assembled and carefully handled, under ordinary working conditions. Neither this lamp, however, nor any other testing lamp with which I am acquainted, is absolutely safe if carelessly exposed to a highly explosive mixture of gas and inflammable dust carried in a current moving with a high velocity.

Firebosses frequently do very careless things while using the safety lamp. In the event of an accident when the actual circumstance is not known it is generally charged to the failure of the lamp, instead of being attributed to carelessness on the part of the fireboss. The Wolf testing lamp, I believe, is safe for the purpose for which it was intended. So are many other instruments. A revolver is a safe weapon in the hands of a careful and experienced man, but would be a dangerous plaything in the hands of a thoughtless boy.

Movements of Fireboss Not Made Clear

Returning, however, to the account of the explosion as given by Mr. Moore, it does not make plain to me the exact movements of the fireboss after he had connected the hose to the air-line pipe on the slant. Did he then take the hose up the slant, carrying his lamp with him, and attempt to adjust the hose at the face so that it would blow down the slant? This being done, did he now take his lamp and, going back, turn on the compressed air in full force? Then, with his lamp in his hand, did he again advance up the slant against a highly explosive mixture, to within 21 ft. of the end of the hose when the explosion occurred?

If we are to understand that was his proceedure, I must say it was not only a most careless but a highly foolish act for an experienced fireboss. It would seem to me likely that to carry a lamp against such an explosive mixture traveling at a high velocity, would result in the lamp being put out or the explosion occurring before the point was reached where the lamp was found lying in the passage, after the explosion.

It is stated that the fireboss was killed by the force of the explosion; but it is not explained how he could have gotten 84 ft. away from his lamp. Without information as to how the man's lamp was found 21 ft. from the end of the hose, and his body 105 ft. from the same point, one is led to assume that the order of his procedure may have been as follows:

Having connected the hose to the air-line pipe and taking it and his lamp, the fireboss went up the slant, for the purpose of adjusting the hose at the face as he did. Setting his lamp down 21 ft. from the face or end of the hose, so that he could properly adjust the hose by the light of the lamp, and leaving it setting on the bottom, he goes back and turns on the compressed air without ever thinking of his lamp. Returning up the slant, the explosion occurred when he was 84 ft. from where he had left the lamp.

Overheated Condition of Lamp Probable

Mr. Moore's suggestion that as the lamp had been used several hours previously for illuminating purposes it was overheated, I think is both logical and correct. Let me add, that to get more light by which to work, and in his hurry changing the hose, the man may have raised the flame of his lamp and forgotten it, while the heat of the already overheated lamp was increasing. Coming in contact with an explosive mixture traveling under high pressure, would be more than any testing lamp could be expected to stand in this heated condition.

Mr. Moore does not inform us as to the experience and competency of his fireboss. I presume, however, the man held a certificate of competency granted him by an authorized examining board. But, doing as it appears likely he did do, the result would have been the same had he possessed a pocket full of certificates.

In closing, I wish to say that I am not criticising Mr. Moore, further than that he seems to ascribe all the blame to the assumed failure of the safety lamp, and none to his fireboss. Just here, let me emphasize this thought, rules of safety, unless strictly practiced, and safety lamps, unless carefully handled and properly used, will not insure protection to life in coal mines.

JOHN ROSE,
Dayton, Tenn. Former District Mine Inspector.

Where Mine Foremen Too Often Fail

Many mine foremen rely too largely on their assistants—Efficiency requires personal supervision of the work—Assistant foreman often lacking in needed experience.

SINCE reading many letters in *Coal Age* where reference is made to foremen who have failed to make good, I am prompted to offer a few remarks on this important subject. A mine foreman holds a most responsible position and on his success or failure depends the future successful operation of the mine.

Close observation, extending over a long period, and a study of the habits of a large number of mine foremen have brought me to the conclusion that the chief cause of many failures on the part of foremen is the fact that they rely too largely on their assistants. Strange as it may seem, mine foremen will often leave the planning and carrying out of the work entirely in the hands of assistants.

Without casting any reflections on the well meaning and faithful work of many of these assistants, it must be said that, in too many instances, an assistant foreman lacks the needed experience to enable him to plan the work and give the necessary instructions to the men in his charge. It is just here that the need of an efficient mine foreman is much felt.

Supervision by Mine Foreman Needed

Efficiency in mine management underground requires the constant close supervision of every branch of the work, by the mine foreman himself. On his shoulders alone should rest the responsibility for the successful planning and prosecution of the work. It is not enough that he has faithful assistants, who are each put in charge of work in different sections of the mine. A good foreman will, himself, look constantly after the work, thus aiding and encouraging each assistant foreman in the performance of his work.

More than once, have foremen come under my observation who seldom ever left the bottom of the shaft. From that point, generally, they would assume to direct the work and issue orders to their several assistants. If they did leave the bottom for a time they would hardly ever get farther into the mine than to some parting where they would sit down and remain until they got ready to return to the bottom for the balance of the day.

Reports, coming from reliable sources, have informed me that two months would frequently elapse between the visits of a head foreman at the working face of a mine. No argument is needed to show that work of this kind, on the part of the foreman in charge of a mine, is a real handicap. Instead of assisting the production of coal, a foreman of this type is an absolute hindrance. The mine would do better without him.

Influence of Foreman's Example

In plain words, a foreman of the kind I have just described is lazy and of no value to the company who employs him. Yet, we often see such foremen retain their positions for years. In every case, the company appears to be perfectly satisfied and seems to think that the foreman is doing the best that can be expected of him. It is an enigma to me how such men can hold their jobs. Should they ever get a position in another company it is certain they would have to change their tactics in order to hold their places longer than a few days or months, at the most.

It goes without saying that such foremen are failures. A lesson I learned long ago is that when a mine foreman shifts his responsibilities onto the shoulders of his assistants he is bound to fail and, sooner or later, the results of his inefficiency will be clearly seen by practical men in touch with the mine where he is employed. If the management of the company fails to see his shortcomings it is because their eyes are closed to his faults.

As I said before, assistant foremen, however faithful in the performance of the work allotted to them, cannot be expected to perform the same tasks and assume the responsibilities of the mine foreman. That official should have a wider experience, which would fit him for the larger duties of his position. For this reason, it is a mistake for a foreman to fail to supervise the work of each of his assistants and give them the benefit of his more mature judgment and experience.

Advantage Gained by Close Supervision

By so doing, he will assure his own success as foreman, and the force of his example will inspire every worker in the mine. The cost of production of coal will be decreased, as a result of the close supervision which every intelligent foreman gives to the work in his charge. Not only that, but the same pleasing results will be manifest in the pay envelope of every worker in the mine.

One word more and I am done. I want to say many foremen seem to think that, having obtained their certificates, they need not exert themselves to learn more. They should remember that coal mining is very much like a progressive plant, requiring constant study and reading, together with hard work to keep oneself up to date on the latest improved methods and equipment.

Hillside, Ky. O. Kennett.

Draining Gas from Seam by Sinking Boreholes from Surface

Effect of water in borehole to prevent escape of gas—Holes drilled at intervals on line of entries—Casing pipe extended above surface.

IN LOOKING over a few back numbers of *Coal Age* the other day, my eye caught a letter written by an inquirer, in which he mentioned having tried sinking boreholes from the surface to drain the gas from a coal seam, in order to prevent the sudden outburst of gas in the mine, which had occurred at frequent intervals. Thinking the matter over, it seemed to me that the inquirer had overlooked one thing that was probably the cause of his getting poor results by this method.

As far as I know, mention has never been made of the effect of water standing in the borehole and preventing the escape of the gas coming from the coal seam or the overlying strata as the case may be. To my mind, when water stands in the hole to a considerable depth, it must form an obstacle and obstruct the flow of gas from the seam.

High Pressure of Gas Caused Outbursts

In the instance referred to by the correspondent, the gas in that seam was under a considerable pressure and was the cause of sudden and severe outbursts in the mine, throwing down tons of coal in the entries and filling the mine with gas and dust. It was to avoid these outbursts of gas that boreholes had been sunk from the surface, at points ahead of the workings, in the hope of draining the gas from the seam and reducing its pressure to a safe amount.

Allow me to suggest, in this connection, that it would be well to sink the boreholes to such a depth below the bottom of the seam as would hold the water accumulating in the hole and prevent its obstructing the flow of the gas from the seam or overlying strata. In order to determine the necessary depth of the holes, previous careful measurements should be taken to ascertain the amount of water standing in the hole before starting to drill to a greater depth.

In order to obtain good results, these boreholes should

be drilled at regular intervals, not more than 1,000 ft. apart, on the line of the main entries; and the same system should be followed over each pair of cross-entries. If there are abandoned workings in the mine, every effort should be made to push the work of drawing pillars and entry stumps, so as to induce a general fall of roof in such places, which will assist in relieving the great pressure of the gas.

Before closing, allow me to suggest that all boreholes drilled from the surface, for the purpose of draining gas from the seam below, should be cased and the casing pipe extended from 8 to 10 ft. above the surface. This will prevent the hole from becoming obstructed by earth and other matter falling into it, or by mischievous persons filling it with stones, dropping them into the hole. I would also advise fencing in these holes by a substantial enclosure with a suitable warning to persons not to interfere with the pipe. OSCAR H. JONES.

Wilder, Tenn.

Inquiries Of General Interest

Cripple Creek Drainage Tunnel

Pumping in Individual Mines Fruitless—Drainage a Joint Problem in the District—Many Mines Derive Benefit

PLEASE advise through the columns of *Coal Age* what is the longest tunnel driven for drainage, in mining districts, stating where it is located and the number of mines drained. P. A. Z.

Santoy, Ohio.

Inquiry in different mining districts has elicited the fact that probably the longest drainage tunnel, driven for such purpose, in this country, is that known as the "Cripple Creek Drainage Tunnel," which was started early in the year 1903 and practically completed the following year.

The problem of mine drainage had grown to be one of vital importance in the Cripple Creek district, where the flooding of many mines had caused their temporary abandonment. The matter was finally brought to a head by trying experiences in the Elkton, and other deep mines. It was found that pumping operations in those mines resulted in handling the water from a large number of other mines in the vicinity. Investigation showed that the drainage area was of considerable extent, which made the question of mine drainage in the entire district a problem of joint interest.

COMMITTEE OF MINE OWNERS APPOINTED

A committee was therefore appointed, representing the mine owners of the district, to look into the matter. Their report showed that the general water level in the mines had an altitude of practically 9,000 ft. above sea level. Several plans were discussed, the two main propositions being the sinking of a shaft and the erection and operation of a large pumping plant capable of handling the water from the district; as compared with the driving of a long drainage tunnel to accomplish the same object.

The comparative cost of these two propositions favored the latter scheme. The length of the proposed tunnel was about 10,000 ft. and the work was estimated to cost in the neighborhood of $300,000. The question of financing the scheme, however, was one of minor importance, in a district where the yearly production of gold amounted to $20,000,000 worth of metal. Moreover, it was realized that the results growing out of the work of driving the tunnel would not be confined to the question of draining the mines, which was the object in view. Incidentally, the geological information obtained by cutting across the strata would be of the greatest interest, in showing the continuity of the veins and ore bodies in respect to depth, and much other information that would be of value in the district. It was not unreasonable to assume that many new ore bodies would be discovered during the progress of the work.

Owing to the extent of the drainage area in the district, it is impossible to state how many mines derived a permanent benefit when the work was completed. The results were general throughout the region. We shall be glad if *Coal Age* readers can give further information regarding this or other drainage tunnels, here or elsewhere.

Blue Flame at Finger Tips

Static charge from engine belt, due to friction, appears as bluish flame at finger tips—Effect caused by rarefying of the air—Appearance similar to blue vault of the heavens.

KINDLY explain through the interesting columns of *Coal Age*, what is the cause of the appearance of a blue flame at the finger tips when one extends his hand toward the rapidly moving belt of an engine driving a generator or other machine. There is, at the same time, a prickling sensation felt, but the fingers are not burned or otherwise harmed. The experience is a new one to me, and one that I fail to understand.

Stillwater, Ohio. J. H. BLAIR.

The bluish appearance here referred to is not a flame or the fingers would be burned. It is a halo caused by or resulting from a local rarefication of the air, due to the passage of a static electrical charge from the belt to the hand held with fingers pointing toward it. As in all electrical devices, the intensity of the charge is greatest at a pointed end, which seems to have an increased power of attraction. This intensity at the finger tips may be assumed to produce a local effect to give the air a bluish tinge similar to the blue sky of the rarefied upper atmosphere.

An engine belt driving a heavy machine of any description and running at a high velocity will often become highly charged with frictional electricity. The static charge flows continuously from the belt to the finger tips that attract it; but the intensity of the charge is not sufficient to produce a spark. The bluish halo can be seen best in the dark or a subdued light.

The friction of the rapid belt in the surrounding air and, in part, to slippage on the pulleys, is what creates the electric charge. A similar static charge is produced when the hand is rubbed over a sheet of paper, or when a person, in slippered feet, moves about briskly over a new brussels carpet. On a dry, cold day, the writer has frequently lighted a gas jet by this means, touching the burner tip with his fingers and producing a spark that ignited the gas.

Examination Questions Answered

Examination for Mine Examiners Springfield, Ill., Mar. 19, 1923

(Selected Questions)

QUESTION—*What is the law as it applies to air currents and splits?*

ANSWER—The Illinois law (Sec. 14-b) requires the main air current to be divided, so as to give a separate current to every 100 men at work; but the mine inspector is authorized to order, in writing, separate currents for a smaller number of men, when he deems this necessary. The same section (a) authorizes the mine inspector to require, in writing, a larger circulation of air than 100 cu.ft., per man per minute, and 500 cu.ft., per mule per minute., in non-gaseous mines, or 150 cu.ft., per man per minute, in gaseous mines, if conditions, in his judgment, require such increased quantities.

QUESTION—*Why is the air split in mines?*

ANSWER—The purpose of splitting the air current in a mine is, chiefly, to afford a better distribution of the air, according to the need in each section of the workings, and to give to each section purer air than when the current is carried from one section to another continuously. A local explosion of gas or dust occurring in one section of the mine may not be transmitted to another section ventilated by a separate air split. Also, dividing the air reduces its velocity and not only requires less power for the circulation but provides safer conditions at the working face.

QUESTION—*Is it proof of good ventilation, in a gaseous mine, when a very rapid current of air is passing through a small airway? Give reasons.*

ANSWER—A rapid current passing in a small airway indicates a high velocity of the air, which is a dangerous factor in the ventilation of a gaseous mine, because of the danger of the high velocity of the air current forcing the flame of a safety lamp through the gauze. Moreover, the high velocity of the air current will cause it to carry a greater quantity of dust in suspension than where the air is made to travel at a lower velocity, by enlarging the sectional area of the airway.

QUESTION—*With a temperature of 32 deg. F., what is the weight of a cubic foot of air when the barometer reads 29.2 in.?*

ANSWER—The weight of a cubic foot of air, under these conditions, is given by the formula,

$$w = \frac{1.3273B}{460 + t} = \frac{1.3273 \times 29.2}{460 + 32} = 0.07877 \text{ lb.}$$

QUESTION—*What are the laws in reference to persons seeking a certificate as mine examiner?*

ANSWER—Section 2 (f) of the Illinois mining laws requires each applicant for a certificate to produce satisfactory evidence that he is a citizen of the United States, twenty-one years of age, of good repute and temperate habits and having at least four years practical mining experience. He must pass an examination regarding his experience in mines generating gas and his knowledge of the nature and properties of firedamp, laws of ventilation, construction and use of safety lamps and the laws relating to safeguarding the mine against fire. He must also possess a knowledge of first-aid to the injured and mine-rescue methods.

QUESTION—*What are the duties of a mine examiner?*

ANSWER—Section 21 (b) of the Illinois law requires the mine examiner to examine the underground workings, in his charge, within eight hours previous to the time for the dayshift to go to work, each day that the mine is to be operated. Where an air split generates gas in dangerous quantity the examination must be made within six hours of that time, provided the mine inspector, in his judgment, does not require a still shorter period for the examination. In mines where electric lamps are used exclusively, the law requires the examination to be made within four hours of the time for the dayshift to enter the mine.

The examiner must carry with him a safety lamp, in good order, and a rod or bar for sounding the roof. He must see that the air current is traveling in sufficient quantity in its proper course. The law requires the examiner to measure the air passing at the last crosscut in each pair of entries, or the last breakthrough in a section, in longwall mining, and at other necessary points and note these measurements in a book kept for that purpose. He must inspect all places where men must pass or work, and observe any dangerous roof conditions or bodies of accumulated gas. He must examine all roadways and air-courses, together with the accessible part of recent falls and old gobs.

As evidence of his morning examination, the examiner must mark with chalk the date of his visit, in a suitable place on the wall, but not on the face of the coal, in each place examined. Where danger is found, he must mark the place plainly, as a warning for men to keep out, placing two obstructions across the road, not less than 20 ft. apart, one being outside of the last open crosscut, in any place where a body of gas is found. He must record the results of his examination in a book kept for that purpose, when completing his work each day, and take possession of the entrance checks of men in whose places danger has been found, giving such checks to the mine manager before the men are permitted to enter the mine.

QUESTION—*How would you remove firedamp from the face of an entry, the face being 50 ft. inside of the last open crosscut?*

ANSWER—Before making any attempt to disturb this gas, all the men working on the return airway, or the return of this air split, must be withdrawn and every approach to the return current of that section properly safeguarded, to prevent men from entering the current. This being done, a line of brattice must be carried from the outby corner of the rib of the last open crosscut and extended up the entry, by adding short lengths of brattice as the gas is removed. The line of brattice must be set about two feet from the right-hand rib when facing the head of the entry, so that the intake side of the brattice will have the smaller area. Only experienced men must be employed in this work and frequent tests must be made with an approved safety lamp to ascertain the progress of the work. No open lights must be allowed in any portion of the entry. When the gas has been cleared from the face of each entry the mine examiner must then make a thorough examination of the entire section, on the return of this current, before permitting men to enter for work.

Gray Silver and H. L. Stimson to Speak At N. C. A. Convention

An address by Gray Silver, president of the American Farm Bureau Federation, will be the principal event of the Wednesday session of the annual convention of the National Coal Association, which will be held in Atlantic City beginning June 19. There will be no general session on Tuesday, however, for that day will be given over to the state and districts meetings. Delegates will register on that day and the directors will meet at luncheon at the Hotel Traymore.

In addition to Mr. Silver's address on Wednesday morning President Ogle will make his report, as will Executive Secretary Gandy. The Cost Accounting Committee and the Credentials Committee also will submit reports.

On Wednesday night there will be vaudeville acts and a boxing match at the North Side Athletic Club.

The principal address on Thursday morning will be made by Colonel Henry L. Stimson. J. C. Brydon will acquaint the delegates with the work which has been done by the Bituminous Operators' Special Committee and C. E. Bockus will tell of the work of the Publicity Committee. A letter from Senator Stanley, of Kentucky, will be read at this session. On Thursday morning also reports of the election of directors from the various states and the nominations of directors at large will be received.

"The Poison in a Democracy" is the title of an address which will be delivered on Friday morning by Colonel Guy D. Goff. At this session the directors at large will be elected. Immediately thereafter the new board of directors will retire for an organization meeting. The incoming president will be introduced. Reports will be presented by the Railroad Relations Committee and by the Finance Committee.

Wadleigh Reports Spotty Conditions in Principal Bituminous Coal Fields

F. R. Wadleigh, Federal Fuel Distributor, on June 12, gave out a survey of transportation, distribution and labor conditions in the principal bituminous coal fields as of June 1, indicating that the market throughout the country is spotty. Colorado operators are convinced that with the conditions existing nothing can prevent an abnormal demand this fall and winter. In Illinois there is almost no movement aside from a large tonnage of steam coal and railroad fuel. The mines in Indiana are being operated at approximately 45 per cent of capacity, but there is no scarcity of coal. Car supply, taken as a whole, is not bad.

Consumers of western Kentucky coals are storing some, with car supply and movement generally good. Mine-run coal can be purchased from 25c. to 50c. per ton less than the cost of production. The mines in northeastern Kentucky are operating on about a 38 per cent basis, the loss of time being due to shortage of transportation facilities. This district has not felt any noticeable reflection of the "no market" condition, because a great volume of this coal is used by the steel industry, byproduct coking and gas plants. The market in the eastern Kentucky fields is rather dull, demand being for the better prepared coals. Some of the high-cost production mines have closed down.

Reports from New England show an inactive buyers' market with about 60 days' stocks on hand, exclusive of railroads. All embargoes have been removed and there is only slight congestion at the junction points.

The Somerset County (Pa.) district reports little change in market conditions, but a better demand for the higher grades of coal. Car supply, however, is better.

The demand from the West for Pocahontas district coals is better than the Eastern, Southern or export markets. Some concern is felt over the apparent hesitancy of consumers of household coal to take in the proper amount of domestic sizes. Tug River district conditions are good, with a brisk demand for tide and westbound coal. The markets of the Fairmont field are absorbing a record tonnage from this section. With the free movement of tonnage and the return of ideal conditions from the standpoint of the consumer, some 100 inefficient mines, or mines producing inferior coal, have permanently closed down, enabling the railroads to distribute cars to the mines continuing operation.

Logan County district market conditions are reported as poor, and most operators shipping on contracts only. Some of the mines in the Kanawha district on both the C. & O. and New York Central lines have shut down, giving as their reason that the prices which may be obtained are not sufficient to permit operation except at a loss. There is still a strong demand for more New River coal that can be produced under present car-supply conditions.

The outlook for coal in the Northwest is good. Some industries, while not buying heavily, are closely canvassing the situation, and other industries are buying from hand to mouth.

The production of anthracite is being pushed as hard as labor conditions will permit. Distribution is going forward regularly, preference, of course, being given to northern New England and the territory served by the upper Lake docks, where movement must be completed before it can be interfered with by adverse weather conditions. The storage yards of the operators are bare of domestic coals, as also, generally speaking, are the yards of the dealers, the latter delivering coal to consumers as soon as they receive it.

Midwest Retailers Resent Questionnaires As Discriminations Favoring Snowbirds

The annual meeting of the Midwest Retail Coal Association opened June 5 at the American Annex Hotel, St. Louis, with an attendance of seventy-three. L. P. Coan, president of the Coal Service Bureau of St. Louis, welcomed the dealers to St. Louis, and H. F. Shrankler, president of the association, responded.

The program included a talk on "Automatic Conveying Machinery," by A. L. Shaw, of the Chicago Automatic Conveyor Co., after which several questions were asked and answered.

A paper on "Coal Storage" by C. G. Brinley, of the Gifford-Wood Co., developed an interesting discussion, in which Mr. Kelly, of Springfield, took a conspicuous part. H. S. Mitchell of the Coal Credit & Correct Weight Bureau, Kansas City, spoke on claims and claim problems from the viewpoint of those having an association through which to collect them, while H. R. Oglesby discussed the problem from the standpoint of the small-town dealer.

After a spirited discussion this resolution was adopted:

"Resolved, That the request of the Coal Commission that retail coal dealers answer questionnaires is unreasonable, unjust, is an illegal request and is a rank discrimination against honest business men in favor of dishonest coal agents and jobbers, commonly known as snowbirds;

"Be it therefore, further resolved that to be constitutional a law or statute must not discriminate, and it is not lawful to make an honest coal merchant go to trouble and expense in furnishing a history, for a ten-year period, of his business and to further compel him to keep books that will quickly furnish to any investigator the status of the business of such dealer, and all this because this dealer invests money in land, buildings and necessary equipment to properly conduct a coal business and to carry coal in storage for the protection of his community during strikes, blizzards and other contingencies, and

"Whereas, This same dealer has competition that has no investment, pays no license or taxes, keeps no books or records, has no established place of business, but as a rule is dishonest, unfair, incompetent, ignorant of coal knowledge and conditions, and destroys public confidence in honest tradesmen who sell coal of good quality at a fair price, by misrepresentative advertising, who incites public unrest and prevents the spring and summer buying of coal by false and ignorant rumors of lower prices to come;

"Be it therefore further resolved that we protest against any reports being furnished from retail coal dealers properly equipped and of legal and financial responsibility to any commission for any purpose whatever while the retail coal trade's unfair and unreliable competitor and the wholesale distributor for whom the local distributor is often an agent is not forced to furnish the same data requested of the dealer."

Stabilizing Effect of Concentrated Ownership on Supply And Price of Anthracite Impresses Commission

By Paul Wooton
Washington Correspondent of *Coal Age*

While members of the President's Coal Commission are being particularly careful not to anticipate any of the conclusions which may be reached in the anthracite report, it is difficult to see how they can avoid passing on two great industrial problems—competition versus centralization and what procedure is to be followed when labor and capital fail to reach an agreement. In all industry there is no better illustration of highly concentrated corporate ownership and of runaway competition than is afforded by the anthracite and bituminous mining operations in the United States.

The commission's study has brought out clearly the stabilizing effect of this concentrated ownership on supply and price. The members of the commission, it is known, have been impressed with the success of the anthracite producers in preventing a runaway market during the past winter, through their control over the bulk of the tonnage. Such flurry as there was can be blamed on the competition that does exist, many believe. There are some who believe a majority of the commission would oppose any effort to break up the closely knit business organization which produces most of the anthracite. They may have some suggestion in their report as to the means which can be employed to prevent possible abuse of this control. It is difficult to imagine how the commission can make a report on anthracite coal without passing on the merits of that type of control. In the bituminous-coal industry many things can be done which would improve the situation, but in anthracite the outstanading questions are two—centralization and labor relations.

The situation in the anthracite field is such that it seems highly probable that the report will have some suggestion as to what additional machinery is to be set up for use when the operators and the mine workers cannot reach an agreement. In anthracite each side is 100 per cent organized. The employees present a homogeneous front and the operators are always in step. For nearly twenty years their differences have been handled in a fairly satisfactory manner through the existing machinery, but it is recognized that it is not adequate when a major difference occurs.

How Anthracite Deadlocks Are Settled

When a deadlock occurs under present conditions the two parties to the controversy either fight it out or voluntarily agree to some form of arbitration. In the former case the public frequently is denied adequate fuel supply while the contestants engage in the fighting out. Arbitrations in the past usually have been undertaken after great losses have been suffered and after coal production has been long reduced. None would be surprised if the Coal Commission were to prescribe the exact form arbitation would take. It may not go so far as to make arbitration compulsory, but it may have some plan whereby the arbitrational machinery is expected to begin to function immediately when a deadlock is reached, with reliance placed on the force of public opinion to bring about its use.

Chairman Hammond stated Saturday that the commission is wrestling with the valuation problem. The situation with regard to valuations is affected importantly by recent decisions of the Supreme Court of the United States. He admitted that the public will be critical of the valuations used in the computing of profits in the anthracite industry. The report of the special advisory committee on valuations had not been received on that date, however. Mr. Hammond brought out that it is unfortunate that the law prescribes an exact date for the issuance of the anthracite report. If the commission had three weeks more time a more complete report could be made, he stated. He admitted, however, that the commission has had before it for some time a large enough proportion of the returns from the industry to enable members to form conclusions contingent on corroboration by the remaining returns covering the full tonnage. The report made by Senator Pepper on the legal aspects of royalty regulation has been received.

The commission is going minutely and carefully into the whole question of the check-off, Mr. Hammond revealed. He admitted that it would be interesting to know in detail the use which the Mine Workers makes of its revenue. He gave no intimation, however, that any such request would be made or that union officials would be asked as to the alleged use of large funds at Herrin.

Illinois Mining Institute Studies Safety and Other Mine Problems on Boat Trip

A boat trip from St. Louis up the Mississippi and Illinois rivers to LaSalle, Ill., and back, with a fare of geology, roller-bearing problems, fried fish, mining methods, jollity, "down South" hot biscuits, hot discussions, mine safety schemes and appliances, long sleepy rests on deck, jazz music and a conglomeration of other things marked the summer convention of the Illinois Mining Institute June 7-9. About seventy-five men made the trip, absorbed some new ideas, had a vacation that was good though short, and went home looking forward to next summer. For five years the Institute has made such a boat trip, and combined pleasure with a technical program, often resulting in real contributions to the science of coal mining.

This year the convention noted with sadness the absence of the late Prof. H. H. Stoek, of the University of Illinois, a mining engineer whose influence and activity in the Institute had been marked. Also it noted the absence of J. B. Hebenstreit, of Nokomis, Ill., a charter member who is seriously sick. On the afternoon of the second day, as the Institute's steamer, the Piasa, touched at Peoria, a telegram of sympathy and good will was dispatched to the sick man from the group of engineers, state mining officials, coal operators and machinery and equipment men aboard. John G. Millhouse, president of the Institute and Martin Bolt, secretary, conducted the technical sessions and otherwise arranged and engineered the outing.

The very first subject on the Institute's program proved a live one which brought many a man to his feet earnestly. It was mine safety—how to protect men's lives and limbs in spite of their carelessness, ignorance or bullheadedness, and how to protect mine property in spite of difficult conditions. The question came to the fore in a paper written by George H. Dieke, president of the Mine Safety Appliances Co., and read by J. R. Fleming, of St. Louis. The paper treated first the broad proposition of safety in a general way and then got down to detail concerning the principles, the construction and the service of some modern appliances such as the electric cap lamp, masks and rescue outfits, gas indicators, carbon-monoxide detectors to replace canaries and mice, and an inhalator which resuscitates by injecting into a gassed patient a mixture of 95 per cent oxygen and 5 per cent carbon dioxide, making him breathe deeply and bringing him around often without the usual complications of pneumonia, violent headache and the like.

Following the paper, J. E. Jones, safety engineer for the Old Ben Coal Corporation and a man who always is counted on to contribute something worth while to any safety discussion, said that it is strange that in Illinois, in spite of all the safety effort and mechanism of today, the death rate per 1,000 men employed is just as high as it was between 1882 and 1892, the first decade of safety statistics in the state. An average of 3½ lives per 1,000 men per year are sacrificed today, as was the case then. The fatalities per million tons produced have decreased, however.

To his way of thinking, safety effort should be devoted 95 per cent to preventing accidents and 5 per cent to such after-work as first aid and mine rescue. The main thing to do is find causes and eliminate them. Replacing black powder with permissibles was one great step. Using enclosed lights even in non-gaseous mines was another. An open-flame lamp in a non-gaseous mine was the cause, he said, of the terrible Cherry mine disaster in Illinois in 1910.

Much could be done, he thinks, to cut down accidents at faces. It is criminal, in his opinion, to put a loader up against a face that has been undercut and shot but which is hanging loose. Another cause that could be remedied is the taking of miners from their accustomed jobs and putting them on company work. When a man is taken from the face and set at trip riding, trouble may be expected. Men should be trained for their particular jobs and then kept on those jobs. Factories, he said, do an infinitely better job of training their men than do coal mines.

"Few first-aid men get hurt," commented D. D. Wilcox of the Superior Coal Co. "Why is that? We feel that it is because a man gets to thinking safety until precaution with him is natural. If all men could get that attitude of mind, a great advance would have been made. But nowadays in Illinois men don't seem to know whether they are working for the company that pays them or for the union. Union leaders and wrong-headed fellows, too often say that the company wants to teach men safety just to save company money, and the result is that a man may be prejudiced against safe practice. It's true the company wants to save money, but it also wants to save its men's lives and legs and hands and collarbones."

He granted that careful and proper timbering would prevent many roof falls, but it is mighty difficult to tell just how to timber to meet varying conditions of roof and overlying strata. Injuries at the face, he thought, would be reduced if coal were shot down properly and never left overhanging.

Favors Change in Law Requiring Certificates

J. H. Haskins, a state inspector, favored a change in the law to require miners to earn first-aid certificates before they could be certified for work by the state examining board.

"Co-operation between man and company is essential," contributed Frank Tirre, of St. Louis, thereby precipitating a discussion which struck a little fire here and there. Martin Bolt, assistant director of the State Bureau of Mines and Minerals and secretary of the Institute, caused the first flash.

"Proper mining rules properly enforced is the main thing needed to prevent accident," declared Mr. Bolt. "There's no other way to reduce minor accidents. There's a marked lack of enforcement by companies and mine superintendents, and all of you know it. It isn't that you superintendents haven't got horse sense and backbone. It simply is that you don't take the trouble. Tell the rule breakers they must obey or get out, and tell it so that what you say will be heard clear up to the international officers of the union."

He said, further, that too many companies fail to take safety to heart. They pay an insurance company a specified amount of money to watch out for such things and then feel they have done their duty. He thinks companies should encourage their men to study rescue work and send teams to rescue meets and all that sort of thing. J. A. Jefferis, of St. Louis, said his company offered to pay the expenses to a Springfield training course for all the employees who wanted to go. Only six went. Others declined unless the company paid them day wages while they were studying. His experience is that men expect the company to meet them not half way but all the way. Peter Grant, Jr., of Peoria, said he thought better feeling and mutual understanding could be had between men and company if the company took a hand in educating them along many lines.

Replying to Mr. Bolt's frank suggestion to mine superintendents, Mr. Wilcox said superintendents can't fire miners right and left for every little offense. It often would be better to keep the offender and train him better, rather than fire him and spend a lot of time breaking in a new one. Anyway, a superintendent can't be beside every man all the time. He can't see most of the rule infractions for that reason.

A novel and original system of mining on a retreating basis was explained in a paper by Joseph Lord, of Peoria. Mr. Lord explained a diagram of underground layout which he said could be developed to produce almost any amount of coal up to 24,000 or more tons a day. He would run eight triple main haulageways from the center of a square area out diagonally to the corners and out at right angles to center points on each boundary, and the whole area cut into 32 long blocks by branch entries, all driven clear to the boundaries of the property.

Mining this coal by the retreating method, each block would have two faces pointing the outer end of the block into "V" shape. Since each block would be 1,320 ft. wide, each of the two faces would be 870 ft. long. A mining machine could make a continuous cut along each of the 870 ft. faces, the coal shot down and then a trip of 40 cars on a track laid parallel to the face could be loaded with great dispatch either by hand or by mechanical loader. Hoisting would be through a double-deck four-track slope rising from a bottom close to the center of the property.

Mr. Lord declared that the output of such a layout would be almost unlimited, ventilation would be more nearly perfect and damage by an explosion would be less because of greater space for pressure escape, extraction would be practically complete by a system of caving down the roof, and the greatest possible tonnage would be obtained at the least possible cost.

The Institute devoted close attention to a discussion on the geology of Illinois coals by Harold E. Culver, who has been working under the co-operative agreement in Illinois in an effort to determine just what the coal resources of the state are and to work out a method for recognizing each seam as it is encountered.

On the second day of the trip as the boat was passing through the region above Peoria, M. M. Leighton, newly appointed chief of the Illinois Geological Survey, succeeding F. W. DeWolfe, who resigned last spring, talked absorbingly to the Institute about the geology of the locality, whose surface they could see from the boat's deck.

A discussion of roller bearings followed a paper by P. B. Liberman, engineer of tests for the Hyatt Roller Bearing Co. of Newark, N. J. Mr. Lieberman made a number of valuable suggestions about lubrication and the use of heat-treated steel for axles.

John A. Garcia, of Allen & Garcia, Chicago, designers of the skip hoist, told the Institute some of the recent history of that method of hoisting coal and described some of the mining plants where skips are now used.

On the return trip of the boat from LaSalle to St. Louis, L. E. Young, president of the Union Colliery Co., recounted for the Institute some of the experiences his men had driving an entry through a fault in the Kathleen mine at Dowell, Ill.

Name Advisory Boards of Shippers for Full Co-operation with Railroads

The Car Service Division of the American Railway Association announces the appointment of regional advisory boards, composed entirely of shippers, and selected by the shipping public itself, for the purpose of bringing about the fullest measure of co-operation between the shippers and the railroads of the country. These boards will work in conjunction with the district manager of the Car Service Division, together with representatives of the railroads in the various districts.

Regional advisory boards have already been organized in five districts. In the Southeastern region, S. L. Yerkes represents the coal shippers on the advisory board. The Southwestern regional advisory board has A. P. Rudowsky, traffic manager of the Oklahoma operators, as a member, the Trans-Missouri-Kansas advisory board has C. E. Warner, of Kansas City, the Central Western has A. B. Currie, of Omaha, and the Northwestern region has Wayne Ellis, Ivan Bowen, Frank Milhollan and J. J. Murphy, representing the coal industry.

United Mine Workers Would Raise Wages and Cut Prices By Nationalization of Anthracite Mines

Reduction of charges against anthracite through a nationalization plan for the retirement of all capital stock of anthracite companies by the substitution of 6 per cent bonds and the retirement of these bonds through a period of fifty years is suggested in a brief filed with the U. S. Coal Commission by the anthracite miners. The brief, which was made public June 11, was prepared under the direction of Thomas Kennedy, Hazleton, Pa.; C. J. Golden, Shamokin, Pa.; and W. J. Brennan, Scranton, Pa., presidents of the three anthracite districts of the United Mine Workers of America, and is signed by Ellis Searles and John Moore.

In their brief the miners challenge the U. S. Coal Commission's procedure, declaring that neither the miners nor the public will know the facts about the industry unless the present accounting system is revised. The mine workers' officials assert that the commission's questionnaire to the coal operators gives no guarantee of securing the desired facts, and they are of the opinion that the figures obtained by it will probably be inaccurate. The brief recommends the installation of a uniform accounting system for the anthracite industry, so that the public may at all times be in position to ascertain the facts about its fuel supply, the costs, profits and everything connected with it.

"The financing of the anthracite industry," the brief states, "should be so regulated that within fifty years the industry can be entirely free from the charges made upon it by present investors. This applies to both mining companies and coal land companies. It is proposed that this be done without the slightest impairment of reasonable investment totals by:

"(1) Completing the retirement of the present bonded indebtedness.

"(2) Replacing the actual investment represented in outstanding stock by bonds bearing interest at 6 per cent, equal to the net sacrifice of such investment, and then retiring such bonds over a fifty-year period. Power to take stock for conversion purposes, by eminent domain, shall vest in the regulating authority.

"(3) Arranging for public or joint ownership and control of the properties as the stock is replaced by bonds.

"Necessary new capital for additions and betterments shrould come so far as possible from reinvested profits. With interest instead of dividends to pay, profits may be expected to produce a sum sufficient for such additions and betterments.

"We believe that no harm can result from planning out the financing of the industry fifty years ahead. If such planning had been done in 1873 there might be none of the recurrent dissatisfaction which has prevailed ever since. We have, in suggesting a fair return to investors, stated our conviction that the industry should pay no more than it has to pay for necessary new investment. In making our two proposals for financing the industry we have the above consideration in mind.

"We know also that the service which the investors of capital render to the industry is not a permanent one. There is at a given time a need for capital and it is secured by the issue of stocks or bonds. After a course of years, if sufficient surplus has been accumulated, there may be no further need for that capital. But the stocks and bonds are still outstanding and must legally receive their return annually, in the case of stock, indefinitely. The advantage of canceling these obligations has already been recognized by the stockholders of certain mining companies. They have frequently canceled their bonded indebtedness and preferred stock long before maturity.

"Retiring of securities is therefore made when the controlling elements in the companies have been able to accomplish it. It is the wise thing to do from their point of view. It makes their control more complete and more profitable. Just as these controlling elements in some of the companies recognize the fact that the services of certain investors are temporary, to be rewarded with the guarantee of an income for a definite time only, followed by a return of principal, so we recognize that fact. Managers and miners are both paid for their services until they are not needed in the business any more. Then they are discharged. We propose to follow these companies in their quiet accurate logic, and suggest that the industry treat the services of investors like the services of managers and miners."

The miners estimate that retiring the present investment would average only 28c. a ton over the next fifty years, while the amounts paid to capital holders were 78c. in 1920, and $1.40 in 1922-23, and may be more in the future.

The actual cost of the investment in the anthracite industry must be found, the miners say, and they also desire to ascertain the net sacrifice cost of investment. The latter they would base on what the investors have put into the business in cash or its equivalent, what they have taken out of the business in dividends or drawings, and what constitutes a fair and reasonable rate of return. They inform the commission that "if such investment figures are not secured, we fail to see how any fundamental program for the industry can be outlined, or any real progress made in the settlement of an intolerable situation."

The miners say that their proposals provide for a reduction in futurer liabilities of the industry, lower prices and better wages, and the elimination of "the disorganizing influence of high royalties." The brief continues:

"It is proposed that after the investors' net total sacrifice to date has been established and compared with the actual cost of investment, and after a uniform accounting system has been put into effect, a fair rate of return be allowed mining companies and coal land companies if and when earned. Six per cent would be considered as a fair rate of return. Earnings in excess of this rate should be devoted to additions and betterments, lower prices and better wages, as conditions warrant.

"Necessary new capital can be raised by authorized increases in the bonded indebtedness. In the case of coal land companies, excess returns would go to decrease future royalty rates. It is proposed that the investment of stockholders as determined be guaranteed by adequate depletion and depreciation reserves, so that the net sacrifice will be on hand to be returned in full as the several mines are exhausted.

"It will be noted that our proposals cover coal land companies as well as mining companies. This is a very essential provision. Many independent mining companies, because they pay high royalties, and because of their small size, feel free to charge, in time of shortage, as much as $5.50 a ton more than the large companies and to make such charges regardless of the actual mining cost. The result is that the same size and quality coal reaches the big cities at prices which have, in time of shortage, a $5.50 range. Consequently, as Colonel Goethals said in retiring from office as New York State Fuel Administrator, there is at present no way of checking the profiteering of wholesalers and retailers.

"The latter are put in a position where they can make the highest price they pay for any one shipment the basis of their charges to consumers, instead of taking a weighted average as the basis. We propose to eliminate a large part of the present mine cost of the smaller companies by guaranteeing that land owners get a fair return on their investment and no more. The result would be to decrease royalty charges drastically and to abolish the whole system by which prices to consumers can be raised beyond reasonable levels through the disturbing element of the small marginal producer."

In proof of the need for regulating the rate of return on investments in anthracite mining and land leasing the brief cites an instance of 30,000 acres of anthracite land bought by Stephen Girard in 1830 for $178,000, or $6 an acre, the

estimated royalty income of which up-to-date has been about $8,900,000 or 3,800 per cent net.

Citing the profits of five large companies in 1920 as running from 14 to 121 per cent, the brief says: "These figures represent the rate of net income to capital stock outstanding. It will be remembered that profits as reported are probably understated, due to bad accounting procedure."

The miners object especially to arbitrary revaluations of property as unjustifiable overcharges on the public. They ask that excess coal land reserves be eliminated from present mine costs, and quote the bituminous industry, where such elimination would reduce investment 53 per cent.

Wages, the brief states, are bound up with questions of financing the industry and it alleges that capital charges, depletion, interest and profits were 78c. per ton in 1918, and are estimated at $1.40 in 1923. In the opinion of the miners, "some limitation of the investors' constantly encroaching claims upon the industry is imperative."

Continuing, the brief says: "In respect to securing new capital, the fact that to 1920 four companies, mining together about 40 per cent of the total commercial production, had accumulated a book surplus of $74,000,000, leads to the belief that such new capital may be secured in adequate amounts from reinvested profits. Any surplus earnings over such needs would be devoted to reducing prices, paying better wages or hastening the amortization of bonds.

"Mining companies to a very considerable extent have built up the industry through corporate savings. This process should continue. It should become the accepted method for securing new funds. Their surplus earnings should, however, from now on become recognized public property. Only so can they be utilized in a manner which will help and not harm the future of the industry.

"Finally, we suggest that the control of the industry after capital has been retired or funded might rest with the management, the public, the miners or a combination of the three. Such control would be introduced concurrently with the conversion of capital stock into bonds. It is probable that such control would have to be exercised by a holding company under Government auspices. The exact method of ownership and control awaits definition. As we said before, we desire at this point to lay down the general principle of retiring the ever-encroaching claims of anthracite investors upon the public interest and to point out that such claims can be retired at a fraction of their present annual burden. We can see no reason why this should not be done."

Complete Unionization Would Skyrocket Prices, Says Bituminous Commission

Complete unionization of the bituminous coal-mining industry would operate to cause the price of coal to soar to unprecedented heights, according to a statement issued June 9 by the Bituminous Operators' Special Committee.

"If all of the American mines were unionized," the statement says, "the mere threat of such a strike as was called and maintained for five months last year would cause a buyers' panic which would send prices skyward. Under the conditions which existed last year, the beginning of the strike, while it caused some concern on the part of buyers, did not have an immediate effect on coal prices.

The non-union mines were put to work at capacity, bringing their output up so that they were able to supply half the tonnage ordinarily consumed by the country. In states where unionization is complete, such as, for instance, Indiana, the mining of coal was absolutely stopped by the strike. If the whole industry was dominated by the United Mine Workers of America, a general strike would prevent the mining of a single ton of coal anywhere in the United States.

"It is unreasonable to believe that the union would not wield this terrific weapon against the public to force upward the already inflated wage scale. This would increase the cost of producing coal, and would be reflected in higher prices."

Strike at Illinois Mine to Force Making of Scale for Underground Loaders

What scale will Illinois operators be forced to pay men who run mechanical loaders? The question has been coming rapidly to the fore recently as the number of loaders in the state increased and was brought to a head June 5 by a strike of about 300 men at the new Orient No. 2 mine of the Chicago, Wilmington & Franklin Coal Co. near West Frankfort, Ill. The company has been paying a little above the union day wage to the operators of several loaders doing development work mainly. But the mine has reached a point now which gives the men excuse to assert that it is passing out of the development stage and therefore a loader scale should be fixed at once for room work and all other loader operations.

It is obvious that the miners have chosen the Orient No. 2 mine for the start of the loader scale controversy just now because they feel that the time and the place are propitious for forcing the new scale at the highest level. The company has been paying approximately $8.25 a day to loader operators, which is 75c. a day above the union day-wage scale. The machines are said to have operated successfully in spite of obstacles thrown in their way and the output of the mine has swelled. The miners assert that they have loaded out enough coal a day to average them $20 a day at the union tonnage rate. They demand that a scale be fixed at once. Negotiations have produced no scale. Hence the strike, which was not officially authorized by district union officers but was started by the men after a joint board of miners and operators had decided that the company was right, that a scale of $8.56 per day was fair and that the mine was still in the development stage.

A few loaders have been used in other big Illinois mines, but they also have been restricted almost entirely to entry work and rock loading. In Indiana another handful of loaders of various types have been used with varied success. The operators have been paid as high as $12 a day. The machine idea has been spreading with some speed in spite of the knowledge in every operator's mined that a scale for loading could not be fixed peacefully. The entire Middle West is watching with interest the controversy now going on at Orient No. 2.

Bituminous Coal Loaded Into Vessels at Lake Erie Ports During Season to End of May*

Dock Operators Deny Illegal Practices

The response of the Northwestern Coal Dock Operators' Association to the charges of the Federal Trade Commission is a general denial of all allegations implying illegal action. As to the alleged existence of a conspiracy in restraint of trade and an effort to establish a monopoly, both charges are flatly denied. The operators admit that credit information is collected and distributed among the members of the association, but it is contended that this is a lawful practice. They deny that price lists have been circulated among members before publication or that there is one wholesale price for the independent retail companies in the Twin Cities and another for the retail concerns owned by the wholesalers. They offer to show the books of members and to supply any information bearing upon the question. They admit that they have sold the same grades of coal at differenet prices in the Twin Cities than at Duluth, which they explained on the basis of competition from rail coal in the Twin Cities that does not exist at Duluth.

Wholesalers Plan to Smooth Relations of Producers, Shippers, Buyers and Roads

An arbitration plan and other schemes for smoothing out relations between shippers and railroads and between producers, shippers and buyers of coal was awaiting decision of the American Wholesale Coal Association as it opened its convention in Cincinnati, Ohio, on Tuesday, June 12. It was hoped that the association would adopt a standard arbitration method and ask the railroads to adopt it also. An effort was to be made to get the railroads to stop permissive embargoes. Indications were that C. L. Dering, of Chicago, would be elected president to succeed Seth Morton, of Albany, N. Y., though the Pittsburgh delegation was grooming Vice-President Jay W. Johns for a race and the Cleveland contingent also showed signs of a counter administration attitude. About 150 men attended, all having something to say about the U. S. Coal Commission's requests upon wholesalers but nobody apparently proposing that anything be done about it.

John J. Tierney Dies in Philadelphia

John J. Tierney, vice-president and general sales manager of the Crozer-Pocahontas Coal Co. died in Philadelphia, June 11. The funeral is to be held at 10 a.m., June 14, at St. Patrick's Church, Philadelphia. Interment is to be at Newtown, Pa.

At the time of his death Mr. Tierney was the treasurer and a director of the National Coal Association, having served as the association's treasurer since 1917. He was a past president of the Smokeless Coal Operators' Association and had been active in the affairs of the Pocahontas Coal Operators' Association.

Mr. Tierney was born in Newcastle, Pa., Aug. 29, 1857. He married Miss Ida Reedy, of Tremont, Pa., in 1885. He first worked as a telegraph operator in the anthracite region and later attended Villanova College, Villanova, Pa. He was graduated as a mining engineer and worked on the engineering staff of the Philadelphia & Reading Coal & Iron Co. in the anthracite fields.

Mr. Tierney went to the Pocahontas field of West Virginia in 1885 as engineer for the Bluestone Land Co. and later became associated with the extensive Crozer interests there. Along with his own extensive interests throughout that section he was president of the Smokeless Coal Operators' Association of West Virginia from November, 1911, until December, 1915. He moved to Philadelphia and opened his present offices in November, 1900. He was an extensive reader and an authority on coal mining and coal sales.

At the time of his death Mr. Tierney had the following positions: President, Powhatan Coal & Coke Co., Powhatan, W. Va.; Sharon Coal & Coke Co., Sharondale, Ky.; Tierney Coal Co., Powhatan, W. Va.; vice-president, Crozer-Pocahontas Co. and Page Coal & Coke Co., Philadelphia, also Tierney Mining Co., Powhatan, W. Va. He also was a driector and stockholder in the Peerless Coal & Coke Co., Pottsville Pa., besides having numerous other large interests, mostly in mining properties.

Mr. Tierney is survived by his wife and four children: John L. Tierney, Sharondale, Ky.; Edward M. Tierney, Powhatan, W. Va., and Washington, D. C.; George E. Tierney, Philadelphia, and Mrs. Alexander Chambers, Newtown, Pa.

Supreme Court Says Industrial Tribunal Cannot Regulate Wages and Prices

The Kansas Court of Industrial Relations received what is practically equivalent to its death blow when, on June 11, the U. S. Supreme Court, in an unanimous opinion read by Chief Justice Taft, declared that the Industrial Court had no authority to fix wages of employees of the Charles Wolff Packing Co. While the Court did not directly declare the entire act creating the Industrial Court unconstitutional, the decision greatly limits the activities of the Kansas industrial tribunal and the effect probably will be to nullify the objects for which it was created.

The Kansas act gave the Industrial Court authority to adjust disputes and fix wages and conditions of labor in industries producing food, clothing, fuel and for public utilities. While an employee could not be prevented from quitting his job, concerted action, such as a strike, in the face of a mandate from the court was declared illegal.

In the case at issue the secretary of the Meat Cutters' Union in January, 1921, appealed to the court against a reduction in wages by the Charles Wolff Packing Co. A hearing was held and the Industrial Court ordered that wages be advanced beyond the scale fixed by the company, asserting that an emergency existed and that higher wages were in the public interest, as the plant produced food. The company resisted payment of the higher wages and the Industrial Court applied to the State Supreme Court for a mandamus to compel compliance with its order. A commissioner appointed by the State Supreme Court reported that the company had lost $100,000 the year previous and that the evidence did not support the claim that an emergency existed. The State Supreme Court overruled this report by the commissioner and issued the mandamus, whereupon the company applied to the U. S. Supreme Court for a write of error, alleging its property would be taken without due process of law.

In his decision, Chief Justice Taft says the act "curtails the right of the employer on the one hand and of the employee on the other to contract about his affairs. This is part of the liberty of the individual protected by the guarantee of the due process clause of the Fourteenth Amendment."

Coal Export Situation Shows Little Change

Reviewing the overseas coal export situation, F. R. Wadleigh, Federal Fuel Distributor, in a statement on June 8 announced that there has been no marked change since May 1, although coke exports have declined considerably and inquiries are few. An increase in the exports of coal to South America is noted.

Figures given by Mr. Wadleigh show an increase in overseas shipments of coal in April of 192,671 tons and of coke, 98,162 tons over the month of March, when the first effects of the French occupation of the Ruhr were felt.

The statement shows that from April 30 to June 2 a total of 57 charters for coal and 9 for coke shipments abroad were closed.

The falling off in overseas shipments of coke is attributed mainly to an increase in shipments from the Ruhr district and to the expectation of further increases and a possible settlement of the Ruhr situation.

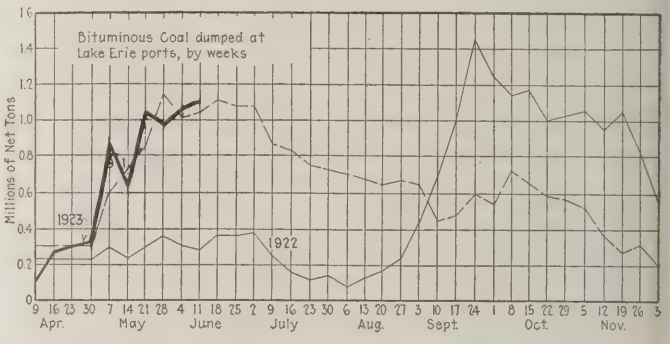
Accurate information on the Ruhr occupation as regards coal and coke production and shipments is impossible to obtain, Mr. Wadleigh states. The strikes in the Ruhr field are reported to be over, but the situation is still difficult and no settlement seems to be definitely in sight. It has been reported that production in April was about 45 per cent of normal and that shipments of coal to France and Italy have increased, but tonnage figures conflict.

Production and the Market

Weekly Review

Production and demand for bituminous coal are now so evenly matched that the market is for the time being becoming firmer. Prices in the aggregate, as shown by *Coal Age* Index of spot prices, held even last week, the average price of $2.60 and index of 215 being unchanged from the previous week. The strength is in the East, offsetting general dullness in the West and South.

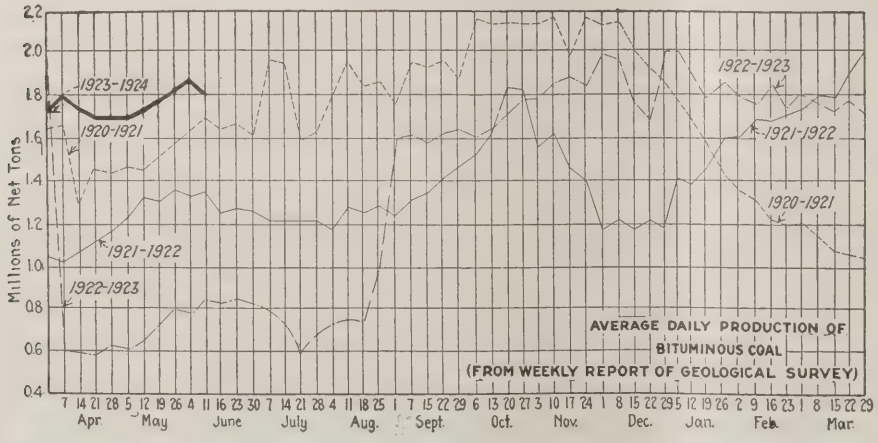
The low point in spot prices with union wages at the present level was reached in March, 1922, at an average for the fourteen major coals of $2.05 per net ton at the mines, 55c. below the present level. Of the four Illinois coals on the list, Southern is yet 60c. above the pre-strike figure, Mt. Olive is 20c. below, and the others about equal. Indiana, western Kentucky, Hocking and Ohio No. 8 are now at approximately the same low point touched early in 1922.



Eastern Kentucky is now higher by 90c., Clearfield by 65c., Pittsburgh by 25c., Cambria and Somerset by 85c., Kanawha by 60c. and Smokeless by 30c. than in March, 1922. Of course Smokeless, Somerset, parts of Clearfield and eastern Kentucky, although non-union, have a wage scale as high as or higher than the union scale, and materially above that in force when the low prices of March, 1922, were the rule. Of the ruling spot quotations there are but two that can be considered profitable—Smokeless and eastern Kentucky. Some shrinkage is possible in Cambria, Somerset and Clearfield prices, but the remainder of the list are at the bottom. With industrial and railroad buying on the present basis there is little likelihood of important spot price recessions through June and possibly July.

Production Well Maintained

Production of soft coal is well maintained at between 10,000,000 and 11,000,000 tons per week. Car supply is better in most fields despite the unprecedented records being attained in total freight loadings. In fact the excellent performance of the railroads leads many coal men to foresee ample cars next autumn and winter, and of course a very easy market. Output of bituminous coal in May was 41,555,000 tons, compared with 50,927,000 the corresponding month of 1918—the record year—47,086,452 in May, 1917, and 33,330,000 in 1921. Production this year to date has been 231,110,000 tons, exceeded in the same period only in 1918.



Buying for the Lake trade, for railroad fuel stocking and for New England industries are the chief features of the market. The overseas export demand is fading, a few scattering inquiries from South America being the only activity.

"Preliminary estimates of soft coal produced in the week ended June 2," says the Geological Survey, "placed the total, including coal coked, lignite, and mine fuel, at

10,059,000 net tons. Thus the short week shows a decrease of 990,000 tons from the revised estimate for the week preceding. The record of daily car loadings shows that with respect to soft coal production Memorial Day counted for one-third of a day. On that basis, the average daily loadings for the week show a small increase over the average of the full week preceding.

"Early returns on car loadings during the week June 4-9 indicate a slight decrease in the rate of production to somewhat below the level attained in the fourth week of May. The total output for the week probably will be in the neighborhood of 10,700,000 net tons."

Estimates of Production

(Net Tons)

	1922	1923
BITUMINOUS		
May 19	4,481,000	10,270,000
May 26 (*b*)	4,889,000	11,049,000
June 2 (*a*)	4,616,000	10,059,000
Daily average	769,000	1,898,000
Calendar year	167,112,000	231,110,000
Daily average cal. year	1,280,000	1,777,000
ANTHRACITE		
May 19	8,000	2,045,000
May 26	10,000	1,956,000
June 2	8,000	1,606,000
Calendar year	21,842,000	43,125,000
COKE		
May 26 (*b*)	97,000	415,000
June 2 (*a*)	97,000	379,000
Calendar year	2,787,000	8,429,000

(*a*) Subject to revision. (*b*) Revised from last report.

Anthracite production is expected to fall off materially the last half of June due to union elections and the tri-district convention at Scranton on June 26. Prices hold firm, the premium on independent coal being unusual for this time of year. Domestic sizes are moving through dealers' yards to householders' cellars. The upper Lake region is already worrying about the smallness of hard-coal receipts. Anthracite loaded at Buffalo last week for Lake movement was 84,700 tons, of which 34,300 went to Duluth and Superior.

No Life in Chicago Market

The coal market in Chicago and the Midwest continued to bump bottom last week with no sign of material change one way or the other. Domestic demand is flat except in the Northwest, where coal is sold all the time from Indiana, Illinois and western Kentucky mines. The steam trade eased along with what it could pick up on the open market at rock-bottom prices.

Smokeless coals in Chicago glutted the market for a few days and bumped the price, but are expected to regain their position as soon as a burst of comparatively heavy shipping is over. A small, steady trade in anthracite is going on all the time. But other domestic trade south of the Minnesota line is dead and almost everything else in the coal trade is in the same condition. Contract coal is about all that is moving. No real strengthening of the market is expected before July 1.

St. Louis Is Inactive Too

A slim domestic trade in storage coal does not satisfy the coal selling agencies of St. Louis.

The southern Illinois mines are stumbling along with one and one half and two days a week working time, while their tracks stand full of no-bills. Du Quoin and Jackson County mines are even worse, as might be expected. A little railroad coal is about all that moves. The Mt. Olive mines continue to approach a complete standstill. Standard district operators freely admit that if it were not for railroad storage business they would be shut down.

After getting about as low as it is possible to go with the present labor scale in western Kentucky, prices have taken a check, and a firmer market is reported. Prepared sizes are quite firm all through the list. Mine-run prices are a little low due to competition from some of the small mines and wagon mines.

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 215, Week of June 11, 1923. Average spot price for same period, $2.60. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

Car supply is good, especially on the Louisville & Nashville lines this month, while the Illinois Central is well up. Mines are reporting around a day and a half to two days a week.

Louisville Hears of Labor Troubles

According to reports of operators and jobbers shortage of cheap labor for unloading cars is resulting in retailers in Louisville and in many districts having shipments held up on orders and this is also having a tendency to check retail buying and industrial stocking. The talk of cutting miners' wages in non-union eastern Kentucky to reduce coal prices is worrying operators paying the union scale.

Movement of prepared coal is fairly good, considering the season. A fair movement to the Lakes is getting away from the Hazard field, and in the Harlan district bigger operators are getting into the Lake movement. Screenings are weakening as a result of increasing production of prepared sizes.

The coal market at Milwaukee is dull. Wholesale and retail movements are only fair for the season. While prices are seemingly maintained at the May schedule, jobbers of western coal assert that dock men are secretly cutting to the extent of 50c. to 75c. per ton on eastern soft coal in an endeavor to win back the trade lost during the recent fuel famine. They say this course is being pursued at the head of the Lakes, where coal is now $1 per ton cheaper than at Lake Michigan ports, and that a general campaign of price cutting may ensue at Milwaukee before long.

The recent 50-c. Kansas City advance in the price of Arkansas semi-anthracite, portending as it did, other advances to come, resulted in a few householders placing orders for their winter's supplies, but the increase was not sufficiently large to be reflected in the wholesale market. Industrial contracts are keeping the mines running one or two days a week, and there is a slight increase in the demand for threshing coal from the southern end of the wheat belt, but as a whole the market out here is as quiet as a midsummer Sunday afternoon.

Utah Market Improves Slightly

There is a slight improvement in the Utah coal market due to a cold snap. Production is about 35 per cent of capacity but is expected to increase at an early date when storage coal is bought. Up to date very few storage orders have been received. Prices remain firm. Labor conditions are satisfactory, except that 25 per cent, or thereabouts, of the men have drifted into the metal mines as a result of short time in the coal fields and labor may be scarce when the market improves.

Colorado operators have not made any statements regarding the recent drop in intrastate freight rates, other than that it would mean lower prices in the near future. The prices on all bituminous products have been increased 25c. per ton, effective June 1. A similar change has been made in the lignite fields. Trade is at a standstill.

Embargoes Steady Cincinnati Market

At Cincinnati the market has been held steady by embargoes placed against shipments to lake ports by the L. & N. Railway, which claims that 20,000 cars are between Cincinnati and Toledo and Sandusky. Spot market prices are indefinite but contract and quality coals continue to command good prices. Steam trade at Columbus was quiet. Buying was limited to current wants, with no apparent intention of increasing reserves although it was said some buyers are accumulating reserve stocks. Domestic trade was quiet although some consumers are laying in Pocahontas and other fancy grades believing that prices may go higher. Production in the eastern Ohio field was within 35,000 tons during the week ended June 2, which included a holiday, of the previous week's output. Demand for lake coal subsided somewhat because of accumulations at the lower lake ports. Demand for steam coal from industries was quiet.

Quotations for 2-in. West Virginia lump at Cincinnati range from $2.50@$3 and for Southeastern Kentucky 2-in. lump $2.50@$2.75, as compared with last week's quotations of $2.75@$3 for West Virginia 2-in. lump and $2.60@$3 for southeastern Kentucky 2-in. lump.

Requirements in the Pittsburgh district increased, due chiefly to the demands of the lake trade, which has been reflected in output. There was no change in the spot market. Demand at Buffalo is slow and the outlook poor. Consumers are buying only to meet current needs.

Production in the central Pennsylvania fields during the week ended June 3 was 15,700 cars, as compared with 17,588 cars the previous week. The output for May was 73,768 cars. Operators are receiving inquiries concerning contracts but are not eager to sign up at present prices. It is estimated there are 300 operations in the district where mining is suspended and that many others are working only part time.

New England Market Sluggish

In New England the current market is sluggish. Buying relaxed and none of the industries seems more than mildly interested in accumulating reserves. In spite of reasonably active buying a month ago there was no special advance in prices all-rail, and possible purchasers are inclined to wait now until well into the summer. While sales agents are still urging probable transportation troubles there is less reaction now to the argument than was the case early in May. Neither all-rail nor coastwise is there likely to be more than scattering business during June, and there are

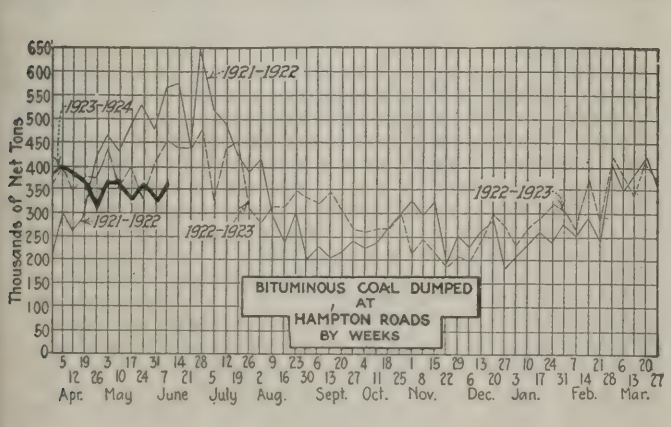
those who expect the present dullness to continue through July.

The week measured a further decline in quotations at Hampton Roads. Reports show increased tonnages at the piers, and $6 per ton f.o.b. vessel is reported the latest selling price of No. 1 Pocahontas and New River. Dumpings coastwise are by no means heavy, however, and apparently there is little chance of firmer quotations for the present. Car movement would improve were coal orders forthcoming, but both west and east the agencies are hard put to it to move current output.

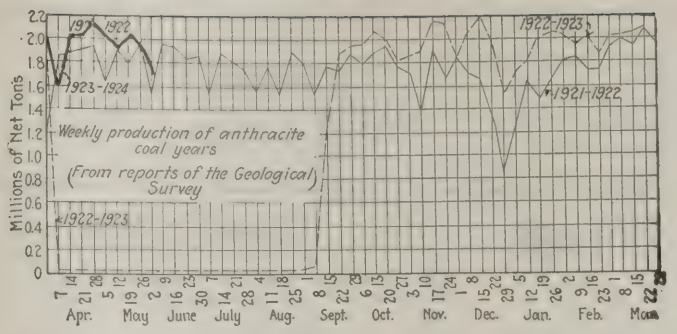
For distribution inland from points like Boston and Providence there is little change. Practically no coal is being forced on the market, and the factors who have facilities of their own are able to maintain prices about on the $8@$8.25 level previously reported. Certain of the quality grades from central Pennsylvania have been sold up for the next thirty days or so, and this condition makes it less necessary for rehandlers of smokeless coals to modify prices. Medium-grade Clearfields have not met with any strong demand in this territory, and quotations on coals of that character are still on a minimum basis.

Shippers of Pennsylvania coals who withdrew from the market a fortnight ago are now back soliciting business for the second half of June. This, of course, creates an unfavorable impression upon buyers, and it is no wonder there now is a pronounced feeling that quotations will recede in the near future.

Quiet at New York and Philadelphia



Demand in the New York market is quiet while inquiries are for the better grades. Receipts at the local docks are smaller, 1,731 cars being reported on June 8 with quotations for the better grades showing increases. The Philadelphia market shows no material change. Consumers are not expected into the market before July 1, when it is believed there will be a movement to stock more heavily around industrial plants.



The market at Baltimore took an upward trend, due to the closing down of more mines supplying that market. There was a better demand for Pool 9 coals for export, whereas the overseas demand heretofore has been mostly for gas coals. Reports from West Virginia indicate that there is a strong demand for smokeless coals not only at tidewater but also from the west.

A dull and listless market was reported at Birmingham, Ala., with hardly any inquiry for spot steam coals and no disposition on the part of the railroads and contract interests to store fuel far in advance of current requirements. Production has decreased and the surplus coal is being gradually cleaned up.

Lake Shipments Disappoint

Lake shipments received at Duluth during May totaled 205,716 tons of anthracite and 1,636,628 tons of bituminous coal. Dock men are becoming nervous because of the small anthracite arrivals. Shipments from the docks at Duluth during May amounted to 7,964 cars, which was disappointing to shippers. During the week ended June 11 there was dumped at lake ports 1,072,416 net tons of cargo coal and 50,632 net tons of fuel coal, making the dumpings for the season 6,371,780 net tons of cargo coal and 288,098 net tons of fuel coal.

Domestic Anthracite Moves Rapidly

Domestic sizes of anthracite continue to move rapidly. There is a heavy demand in all sections as well as in Canada and most independent producers as well as the larger companies are well booked ahead. So far retail dealers have not been able to start stocking, and most dealers claim to have sufficient orders on their books to keep them busy for the balance of the summer. The steam sizes are easier, some companies storing considerable tonnage of these sizes while some independents were disposing part of their output in connection with the larger coals.

The Geological Survey report says: "Production of anthracite in the week ended June 2 decreased 25 per cent from the hitherto current rate of about 2,000,000 net tons a week. The principal carriers of anthracite reported loading 30,700 cars, from which it is estimated that the total output including mine fuel, local sales, and the product of dredges and washeries, was 1,606,000 net tons. No loadings were reported on Memorial Day and on the three following days of the week loadings averaged 10 per cent less than for the same days of the previous week.

"Preliminary reports on car loadings during the first three days of the week June 4-9 show increased rate of production, which if continued through the balance of the week will bring production up to about 1,950,000 net tons."

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

Foreign Market And Export News

Holidays Reduce Great Britain's Coal Output; Export Demand Strong

Two holidays, Whit Monday and Queen Victoria's birthday, tended to reduce Great Britain's coal output for the week ended May 26 to 3,737,000 tons, says a cable to *Coal Age*. Production for the previous week was 5,797,000 tons.

Demand for early shipment from South Wales is easier but there was good inquiry for deliveries during the last six months of the year, particularly from France, Italy, Egypt and South America.

Trade Commissioner Alexander V. Dye, at London, informed the Department of Commerce at Washington, that during the first three months of 1923 bunker coal furnished in the ports of the United Kingdom was 4,568,320 tons, as compared with 4,403,262 tons for the corresponding period of 1922, the slight increase being in marked contrast to the large increase in the coal exports from Great Britain during the same period.

The principal reasons attributed by Commissioner Dye for the failure to increase the amount of bunker coal furnished at United Kingdom ports were the increasing use of oil as fuel, congestion at the docks, resulting in a long delay in loading, and the rise in prices of British coal.

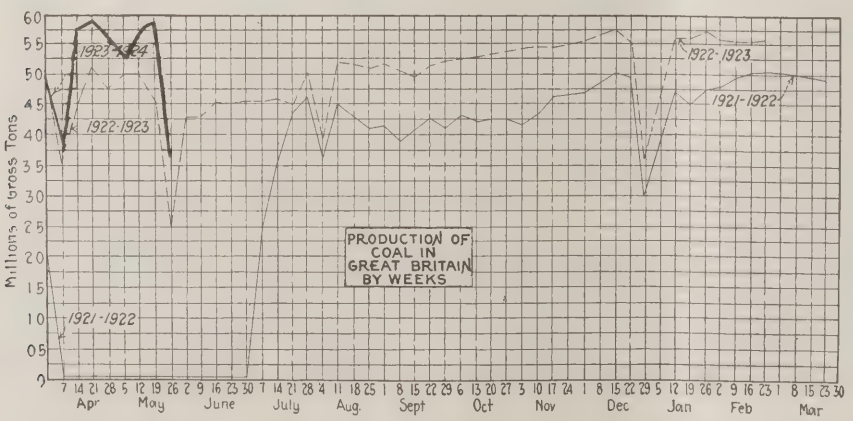
Hampton Roads Situation Dull

Business at Hampton Roads was dull last week, with the market weakening and inquiries falling off. Shippers looked forward to little increase in activity before July, or, perhaps, August.

Coastwise movement was desultory, while bunkers held fairly strong, with export business holding its own. No new contracts were being made. Shipments were largely on orders placed a month or two months ago.

Domestic dealers showed a reluctance to make contracts, preferring to take their chances on what appears to be a steadily declining market. A campaign to encourage domestic consumers to lay in their supplies of coal for next winter is being made, and is stimulating business, to some extent.

French Coal April Imports and Exports



French coal imports and exports during April, according to French Customs returns, follow, in metric tons:

Swiss Coal Imports

Imports of bituminous coal by Switzerland during April last was 160,000 tons as compared with 137,000 tons during the previous month. There was also imported 32,000 tons of coke and 60,000 tons of briquets, as compared with 29,000 tons and 46,000 tons, respectively, during March. Of the coal imported England supplied 47,000 tons, Holland 35,000 tons, France 27,000 tons and Belgium, 24,000 tons.

News Items From Field and Trade

ALABAMA

Charges made in a recent complaint to the U. S. Coal Commission by J. R. Kennamer, president of District No. 20 of the United Mine Workers, that "gunmen" employed during a recent strike at Marvel, by the Roden Coal Co. had put oil in springs where miners and their families got water are denied in a letter made public June 8 by the Bituminous Operators' Special Committee. The letter, written by B. F. Roden, president of the coal company, states that "there are no springs at Marvel except small wet-weather springs of stagnant water, which are oiled to prevent malaria and contamination." His employees, Mr. Roden declares, are furnished free water. The company continued to furnish free water to strikers for three months, he added, but when the strikers refused to vacate the company houses so that other men could be put to work, it was no longer considered necessary to pump about 60,000 gallons of water daily to strikers whose avowed purpose was "to break the company."

ARKANSAS

The Southwestern Coal Commission was recently organized at Fort Smith, in compliance with the terms of a contract previously signed in Kansas City covering operation of coal mines in the Southwestern territory. The commission was organized at a joint meeting of coal operators and miners from District 21, United Mine Workers. John L. Britton, of McAlester, Okla., president of the district, was elected chairman of the commission. Other members are: Representing the miners, Dave F. Frampton, Moberly, Mo., organizer, and W. C. Dockerman, Huntington, Ark. For the operators, J. C. Reid, general manager Cameron Coal Co., Williams, Okla.; Robert Boyd, Central Coal & Coke Co., Hartford, Ark., and P. R. Stewart, Fort Smith, Ark., commissioner for the Coal Operators' Association.

CALIFORNIA

Los Angeles harbor is to have a new 30,000-ton daily capacity coal-bunkering wharf to be second to none on the Pacific Coast. Announcement of this, which will increase the number of ships entering the Los Angeles harbor at least 25 per cent and will mean the expenditure of millions of dollars, was made by Edgar H. McKee, president of the harbor commissioners. It will cost approximately $2,000,000.

COLORADO

McNally & Thompson have opened a new mine, the Sunshine, at Maitland, Huerfano County, with Denver & Rio Grande R.R. connections. This company also operates the Maitland mine at the same location.

ILLINOIS

Stout opposition is still raised by the City of Cairo and other southern Illinois communities to the building of the Illinois Central's proposed 172-mile cut-off from Edgwood to Fulton, Ky., shortening the main line 21 miles and eliminating many heavy grades. The railroad now pays the state a freight tonnage tax under a franchise granted in the early days. It is argued that the state will lose much revenue if the new cut-off is built because the traffic over that line will not be subject to the old franchise terms. The appeal of the towns on the present line is now before the I.C.C. at Washington.

Scranton mine, located five miles northeast of Marion, **broke its own record twice within one week.** On one day 1,028 dumps, or 2,609 tons of coal, were brought to the surface. In one single hour 180 dumps were hoisted. In eight hours fifty-nine railroad cars were loaded. The mine employs 250 loaders and 118 shift men. The company recently installed new locomotives whose service made this tonnage possible.

Breaking all Central Illinois Records, Peabody No. 6 mine near Springfield hoisted 3,255 tons of coal or more than 6.78 tons a minute one day early in June. This surpasses by 133 tons the record established at this mine May 4. The superintendent of the mine is T. W. MacMurdo. Oney Melkush is mine manager and the work was performed by 435 men actually at work in the mine for the day.

INDIANA

Organizers of the United Mine Workers probably will be sent to Boonville in **an effort to unionize all mines in that section,** according to announcement there. A bulletin received there asserted there are 14 non-union mines, employing about 235 miners, with a production of 1,000 tons per day in the territory. It asserted that the wages paid are 20 per cent less than the union scale.

Damage estimated at $25 000 to $30,000 resulted from a fire at the Riley Coal Co. mine, eight miles from Terre Haute recently. The entire plant above ground, consisting of the tipple, engine room, blacksmith shop and wash house, was burned. The fire had gained good headway when discovered and the lack of means of fighting the flames rendered it impossible to save the property. The origin of the fire is not known. Charles J. Kintz is president of the company owning the mine.

Three miners entombed by a cave-in of The New Coal Co.' shaft near Bicknell June 2, were rescued at 10:30 o'clock June 5, after having been imprisoned for more than 79 hours. The men, beyond showing marks of the terrific strain under which they had been laboring while awaiting the outcome of efforts of the mine rescue team to reach them, were little the worse physically for their experience. Fresh air had been forced into the shaft and food lowered to them through a 2-in. casing which had been bored to the bottom of the pit shortly after the cave-in. The mine-rescue squad's work was slowed up considerably when earth in the new shaft they were digging gave way. In addition they were menaced constantly by the possibility of the hastily made shaft caving in. As the rescuers neared the roof of the mine it was necessary for them to work while suspended from the top of the shaft by ropes.

IOWA

The Red Rock Coal Co., of Des Moines, has taken over the four Lucas County properties of the Central Iowa Fuel Co. and will operate them from the headquarters at Red Rock.

KENTUCKY

The Southern Coal Co., Louisville, on June 1 received a contract to supply 75 cars of western Kentucky nut and slack at $1.80 a ton to the Eddyville penitentiary.

Amended articles have been filed by the **Cassidy Coal Co.**, of Lexington, **increasing the capital stock** from $25,000 to $50,000.

Attacks upon the management of the Lynch mines of the United States Steel Corporation are featuring the **campaign of Judge A. W. Barkley for the nomination for governor.** He is charging that the company maintains the community of Lynch in a condition bordering upon slavery and that the votes of the community are controlled by the company and cast at the company's direction. He would levy a heavy tax upon "foreign" owned coal properties but declares his tax campaign is not aimed at the majority of Kentucky coal owners.

The United Mine Workers' organization for District 19, comprising eastern Kentucky and eastern Tennessee, at a recent convention in Middlesboro **charged the operators of the Harlan and Hazard fields with employing deputy sheriffs** to circulate among the miners and **hunt out union men that they might be discharged.** The convention sent a resolution of International headquarters of the union urging that a strike be ordered in all the non-union mines in District 19 in order to bring the operators to their senses.

MINNESOTA

Receipts of coal at Duluth and Superior docks from the opening of navigation on May 5 to June 1 as compiled by K. A. Scott & Co., Duluth vessel agents were:

Dock	Anthracite	Bituminous
Northwestern	55,200	174,700
Berwind		30,500
Pittsburgh	34,500	240,000
Carnegie	26,600	138,400

Northern	15,600	74,100
Zenith Furnace		93,800
Phila. & Reading		8,300
U. S. Corporation		261,200
Reiss	23,000	100,400
Pursglove		8,600
Lehigh	42,400	
Great Lakes		61,100
Total to June 1	207,600	1,631,400

Bituminous receipts in excess of last year, 1,501,200 tons.

Anthracite receipts in excess of last year, 202,600 tons.

MISSOURI

Governor Arthur B. Hyde has vetoed **the "Mine wash house bill."** The Governor declared that the present wash house law is better than the proposed one. The bill would have required owners and operators of mines where 50 or more miners are employed to construct a suitable wash house, large enough to accommodate all of the men employed. The wash house would have individual lockers for employees, would be lighted and equipped with steam driers, and with at least one shower bath for each 10 miners. Plumbing for hot and cold water under pressure would have to be provided, with a separate room and bath for negroes.

NEW YORK

The contract for furnishing **300 cars of slack coal to the city water works** of Buffalo, 100 cars during this and the two following months, **was awarded to the Queen City Coal Co.**, of Buffalo, on its bid of $1.45 per net ton, on a $2.24 freight rate.

The Bituminous Coal Association of Buffalo has elected J. Q. Clarke and H. B. Alderman trustees, with J. T. Roberts (retiring president), C. F. Westfall and E. T. Bline holding over. From this number, according to rule, Mr. Westfall is elected president, Mr. Bline, vice president and Mr. Alderman, secretary and treasurer.

Dividends declared and awaiting payment, as reported currently in the *Annalist*, include the following coal companies:

Company	Rate	Per.	Pay.	B. Close
Glen Alden Coal

OHIO

The damage suit brought by the Rice-Hocking Coal Co. against the Carbondale Coal Co. for $303,000, claimed on the grounds that coal lands of the plaintiff had been damaged, **has been settled for $56,000.**

The Dana Coal Co. has been incorporated with a capital of $10,000 to deal in coal and other commodities. Incorporators are Edward Meyer, Charles E. Chamblin, G. Jolly, W. W. Helmholz and J. A. Culbertson.

The Wester Coal & Supply Co. has been chartered with a capital of $50,000 to deal in coal among other things. Incorporators are Hulda Wester, Anna Wester, J. Walter Wester, Ernest W. Wester and George Wester.

OKLAHOMA

Andy McGarry, of Tahona, **has been elected president of District 21,** United

Mine Workers, according to announcement made by the executive board of the district. The election was held some time ago, but election returns have just recently been canvassed. The election resulted on the first ballot, and it is declared to be the first time in a number of years that a president has been chosen on the first ballot. The district comprises the States of Oklahoma, Arkansas and Texas.

The O. & O. Fuel Co. has been incorporated in Ada, with a capital stock of $750,000, by Orel Busby and Lowrey H. Harrell, both of Ada, and Fred W. Whitney of Middletown, Ohio.

PENNSYLVANIA

Governor Pinchot on May 31 approved the Bidelspacher bill providing for the appointment of a board of examiners to examine applicants for certificates of qualification as mine foremen, assistant mine foremen and fire bosses in bituminous-coal mines. The new law provides that upon petition of the mine inspector of any district the court of common pleas in any county in the district shall appoint an examining board of three persons, consisting of a mine inspector, a miner and an operator or superintendent, all of whom shall be citizens of the state. The miner must have had at least ten years' experience in the bituminous mines of the state and be in actual practice as a miner. Applicants for certificates of qualification as mine foremen and assistant mine foremen shall be citizens of the United States, at least twenty-three years of age and shall have had at least five years' experience as miners or mining engineers or men of general work inside the mines. Applicants for fire bosses' certificates must have had five years' experience also as miners or men of general work in bituminous mines that generate explosive gas. A fee of $2 is to be paid by all applicants and each successful applicant must pay an additional fee of $3 before receiving a certificate.

J. Hayden Oliver, of counsel for the Glen Alden Coal Co., Scranton, said that "passage of mine-cave bills now before the state Legislature will mean that the Glen Alden Coal Co. will no longer repair properties damaged by the company's mining operations. It is a good bill for the Glen Alden Coal Co.," Mr. Oliver continued, "but a poor one for the people. While it will save the coal company thousands of dollars now being spent in mine-cave damage repairs, it will not give the people of Scranton relief equivalent to that now being furnished by the Glen Alden."

Official notice of tri-district convention of the United Mine Workers to be held in Scranton on June 26 says the **purpose of the convention will be to consider and take appropriate action concerning conditions of employment** to become effective after Aug. 31; also to consider basis of representation for future tri-district conventions and such other matters as may properly be brought before the convention. Representatives to this convention will be elected directly by the local unions they represent and shall have one vote for 100 members or less and one additional vote for each 100 members or majority fraction thereof. No delegate will be allowed more than five votes. It is recommended that no local send no more than five delegates.

Governor Pinchot has signed the Williams bill, providing for a survey of the water and fuel resources of the state. The new law creates a power survey board, consisting of the Governor, the Attorney General, the Commissioner of Forestry, the secretary of the Water Supply Commission, the chairman of the Public Service Commission, the Secretary of Agriculture, the Commissioner of Labor and Industry, the State Geologist and a Deputy Attorney General, which is to undertake an outline survey of the water and fuel resources available for Pennsylvania and of the most practicable means for their full utilization for power development. The board also is empowered to recommend in outline a policy which will best secure for the industries, railroads, farms and homes of the commonwealth an abundant and cheap supply of electric current for industrial, transportation, agricultural and domestic use. The Governor is empowered to employ an engineer for the board and fix his salary, but the members of the board will serve without compensation. An appropriation of $35,000 is made, and the board is to report to the 1925 Legislature.

Fire, following an explosion in which six men were burned and overcome by gas, threatened serious damage to a section of the Dorranceton mine of the Lehigh Valley Coal Co. on May 25. At one time it was thought it might be necessary to flood that section of the mine in order to extinguish the flames.

Mrs. Fannie Sellins, organizer for the United Mine Workers, was leading a charging mob of men and women armed with clubs and bricks when she was killed by a volley of shots fired by guards at the plant of the Allegheny Steel Co., according to witnesses for the defense June 7 at the trial of Edward Mannison and D. J. Riley, deputy sheriffs, charged with the murder of the woman union leader. State witnesses had previously testified that there was no disorder at the mine until after the deputies fired into the crowd. R. J. Schrandt, one of the deputies on duty at the time, testified that after a small group of men had been driven back, Mrs. Sellins organized a mob of men and women and led the charge against the line of deputies.

At a meeting of the boards of the Central Pennsylvania Coal Producers' Association and the Association of Bituminous Coal Operators, held in Altoona on June 1, **W. Clark Miller, a prominent Clearfield County lawyer, was chosen permanent umpire to adjust differences** between the operators and the United Mine Workers in the district **arising from the scale agreement.** Mr. Miller succeeds the late Ex-Judge Allison O. Smith. Mr. Miller is not identified with the coal industry.

The Suffolk Anthracite Collieries has issued $1,000,000 first (closed) mortgage 7 per cent sinking fund gold bonds, due in 1938. The Suffolk Anthracite Collieries are being organized to take over the property and assets of the Suffolk Coal Co., including 525 acres of anthracite lands held partly in fee and partly under lease, the property being near Scranton. The mortgage will provide a sinking fund of 30c. per ton on all coal mined and shipped with minimum payments of $67,000 annually to be used to retire bonds quarterly at not above 107½, these minimum payments being sufficient to retire the entire issue at or before maturity.

The American Civil Liberties Union and various affiliated labor organizations are carrying on a determined movement in nearly every state of the country against so-called criminal syndicalism laws, Harry Ward, of New York, president of the union, declared in a "free speech" and "right of public assembly" meeting at Pittsburgh June 3. Many of those who attended the meeting were delegates to the Progressive Miners international committee, which had just ended a two days' conference. **The miners' international formally launched its campaign to force nationalism of the coal industry** and to gain control of the United Mine Workers' organization. The movement, it was said, will be financed by voluntary subscription and a publication will be established, to be known as the *Progressive Miner*, and printed in five languages, to spread the doctrine of mine nationalization and its kindred objectives.

Joseph Williams, of Altoona, inspector of the tenth bituminous inspection district, announced the results of a series of examinations held recently for the positions of mine foremen, first and second grades, assistant mine foremen and firebosses. Twenty-five passed the test for foremen of the first grade, thirty-three for the second grade, twenty-seven for assistant foremen and thirty-seven for firebosses.

A bill which would compel all municipal bodies, councils, school boards and poor boards et al., to file with the clerk of the courts plans and specifications for all proposed public improvements passed the House at Harrisburg and advanced to third reading in the Senate, where it was sent back to Senator Joyce's committee.

Lightning struck the coal tipple at the workings of the Altoona Coal & Coke Co.'s mines at Delaney, Cambria County, six miles west of Cresson on June 2. The tipple was totally destroyed by the fire that resulted, entailing a loss of $11,000. **The tipple will be rebuilt at once.**

The Davis-Fowler mine-cave bills providing for a return of 12½ per cent of the anthracite coal tax to the counties in which it originated and the distribution of this money by two commissions for mine-cave relief and public improvement, were placed on the House calendar June 5. The bills had been held in the Committee on Mines and Mining and Representative David Fowler, Lackawanna, joint sponsor with Senator Davis, of the measures, made the motion that the committee be discharged from further consideration of the bills. **The bills were passed on first reading June 6.**

The Jeddo-Highland Coal Co. is erecting a first-aid hospital at Jeddo for the use of anthracite miners hurt at the operations of the company. It will be equipped with all the requirements for first-aid treatment.

Anthracite companies will be exempt from the provisions of the Armstrong net profits tax bill under amendments adopted by the Senate Finance Committee at Harrisburg June 7. Representatives of the anthracite industry contended that it was unfair to include them in the bill because of the fact that they now pay a capital stock tax and a fifteen mill tax on the market value of coal produced.

A decision handed down by Dr. Charles P. Neill, umpire for the Anthracite Conciliation Board, in the case of a grievance of the locomotive and hoisting engineers of No. 5 colliery of the Susquehanna collieries, near Nanticoke, holds that **all employees who signed the 1916 agreement and are still in the employ of the company must abide by their agreement.** The decision, however, was in favor of a majority of the employees. The contract was signed May 5, 1916, when positions held by some of the complainants should have been considered as nine-hour positions, the occupants of which were working one hour overtime. The positions came under the first section of the 1916 agreement and the new rates should have applied, Dr. Neill holds. It has been established, however, that holders of the positions entered into an agreement with the colliery superintendent that all slope and locomotive engineers and brakemen working on a ten-hour basis prior to April 1, 1916, should be changed from ten hours to nine hours per day, and should be paid for a nine-hour day at the rate established under the agreement of May 20, 1912, for a ten-hour day, subject to an increase of 3 per cent. It was later discovered that this arrangement would not give the men as much as they would receive had they elected to work the nine-hour day under the terms of the 1916 agreement.

TEXAS

V. H. Williams, of San Antonio, and associates have **purchased a bed of lignite** in McCullon County, and will construct an electric power plant there, using the lignite for fuel.

VIRGINIA

The transfer of the offices of the Consolidated Coal Co. from Roanoke to Norfolk is practically completed.

WEST VIRGINIA

The Fairmont-Chicago Coal Co. is about to spend $100,000 more in making improvements to properties recently acquired. Several months ago this company purchased the Chesapeake mine of the Chesapeake Coal Co. as well as about 2,200 acres of Sewickley coal land in Marion County, which will be developed on a large scale. After making the purchase the company expended about $200,000 in erecting additional dwellings for miners and a storehouse, in buying locomotives, installing mining machine and other equipment and in making many other improvements all with the object of insuring a daily output of about 2,500 tons. The latest plans call for the construction of a steel tipple at the Chesapeake mine, near Barrackville, a contract for the construction of the tipple having been awarded to the Pittsburgh Coal Washer company of Pittsburgh. This tipple will be equipped with shaker screens, loading booms, etc., and additional sidings will be constructed to permit the additional loading of prepared coal without delay.

The Reese Creek Coal Co. which was only recently incorporated, has begun the production of coal in the vicinity of Barboursville, on the edge of the Logan field. This concern has a capital stock of $50,000. Approximately 300 acres of coal are under lease and the company also has obtained an option on about 500 acres additional in the same district. Newly elected officers of the company are: F. W. Cline, of Milton, president; Homer Heck, Milton, vice president; Robert J. Lockey, general manager. Directors of the concern are J. W. Cline, Virgil L. Hall, Clyde Harshbarger, James Jackson and Robert J. Lockey.

Operators of the Greenbrier County coal field have joined in defraying the cost of construction of a $60,000 modern school house for children of employees of the various companies in the field. The Greenbrier

field is one of the newer smokeless coal fields of West Virginia.

The Morris-Enochs Coal Co. has just been launched by Charleston people, having a capital stock of $25,000 and with offices at Charleston. Chiefly interested in the new enterprise are S. V. Morris, F. L. Morris, I. F. Sommerville, and L. W. Bowers, of Charleston, and W. S. Enochs, of Ranger.

The Echo Smokeless Coal Co. has been organized by Charleston capitalists, having a capital stock of $50,000. Headquarters of the new concern will be at Charleston. Among those interested in this company are W. D. Guyer, G. O. Stacy, A. S. Guthrie, R. R. Perry and C. A. Brockman.

WASHINGTON, D. C.

Strikes were rife in the northern part of the state for a time after the beginning of the new contract year all without the sanction of district or sub-district officials. It is understood that those who participated in these walkouts were fined as provided in the contract. That has appeared to have had a tonic effect on miners inclined to strike on the slightest pretext, for **there have not been many illegal strikes in recent weeks** in the northern part of the state.

Encouragement of the plan to buy and store coal during the summer months in anticipation of fall and winter needs, not only to overcome the seasonal demand for coal but in order to avoid railroad congestion, is contained in an **appeal made by W. J. Harahan, president of the Chesapeake & Ohio Ry.** Mr. Harahan asks that coal shipments to the Great Lakes be made early in the season.

Fire on June 5 destroyed the tipple and slack bin of the West Virginia Coal & Coke Co. at Junior, in Barbour County, entailing a loss of about $25,000. It is not intended to rebuild at present, owing to general market conditions, but later on a newer and more modern tipple will replace the one destroyed, which had been in commission for the eighteen years. The first may have been of incendiary origin, as some of the mines at Junior are operated open shop, others closed shop. The Junior plant is in the former category but had not been in operation since June 1.

The American Fund for Public Service, known unofficially as the Garland Fund, has **voted $2,000 to the members of District** 17, United Mine Workers, in response to appeals from miners' representatives, who informed the committee that the strikers had been out for fourteen months in Boone and Kanawha counties. In a statement Norman M. Thomas, chairman, and Roger N. Baldwin, secretary of the fund, said that "ordinarily the American Fund does not give strike relief because we regard that as a union function exclusively and because the amounts required are beyond our means. There are, however, exceptional situations when even a little money will help at a critical juncture and when moral as well as financial support means something to men struggling for their rights."

An offering of $1,200,000 Richland Coal Co. first mortgage 6½ per cent serial gold bonds maturing $60,000 on June 1 of each year from 1924 to 1943 inclusive, at prices to yield from 6½ to 7 per cent according to maturity is being made. The proceeds of the issue are to reimburse the company for capital expenditures and to provide additional working capital. The property of the company is located in West Virginia and consists of 7,951 acres of unmined coal lands. Net earnings of the company available for depreciation, depletion, interest and federal taxes for the five years ended Dec. 31, 1922, have averaged $406,298, or five times the maximum interest charges on the new issue of bonds.

The Norfolk Southern Ry. has bought 150,000 tons of coal from three dealers, but the prices paid cannot be made public at this time, according to L. M. Jones, purchasing agent, because other contracts are now pending. The Cabin Creek Consolidated Coal Co. and the Leckie Coal Co. each got 30,000 tons of this order, while the Dixie Splint Coal Co. got 90,000 tons.

Some interesting addresses were delivered at the annual banquet of **the mining extension schools of the Fairmont District held** in Clarksburg during the latter part of May, including those of R. M. Lambie, chief of the West Virginia Department of Mines; Prof. A. C. Callen, of the mining engineering department of West Virginia University; Dean C. R. Jones of the college of engineering; Harold C. Schwarm, president of the Fairmont class; C. K. Brown, of Morgantown, assistant director of the mining extension department; Walter Miller, of Mount Clare; Harold Mason, Carolina; Andrew Henry Shinnston, and state mining inspectors A. L. Lafferty, of Wheeling; C. W. Stuart and Thomas Jarrett, of Weston, and Evan L. Griffiths, of Clarksburg. There were fully two hundred present at the banquet, over which E. W. Laubenstein, of Clarksburg, presided.

UTAH

The Department of the Interior announces that leases of two tracts of coal lands in Utah will be offered at auction at a date to be fixed by the Salt Lake Land Office. The land in question comprises two tracts involving 840 acres and located 40 miles northeast of Richfield.

WASHINGTON

The coal miners in the employ of the Pacific Coal Co., and a number of smaller companies, operating in the Carbonado and Wilkeson coal fields, Pierce County, Washington, **have decided to call off the strike and accept the operators' terms.** The strike which affected some 2,000 men, was called on March 31, 1921, so **it has been in progress for more than two years.** There appears to be some doubt as to whether the operators will take the men back on the terms offered two years ago.

WISCONSIN

John Sweeney, Vice President of the Valiel Coal Co., Milwaukee, **was married** in Chicago on Memorial Day to Miss Grace Fleming. Mr. Sweeney is a nephew of Baron Thomas Shaughnessy, of Canada.

Hereafter the city Milwaukee will purchase its annual coal supply on a basis of estimated heat value. The contracts for the yearly supply will be let about July 15, instead of June 1, as in past years. Contracts will include oxygen content requirements, and contracting dealers must agree to keep on hand at all times a sufficient quantity of coal to supply the needs of the city institution for 30 days.

CANADA

T. M. Grindley Co. is the new name of the organization handling the sale in the Province of British Columbia of the products of the Conveyors Corporation of America, Chicago, Ill. The address of the Grindley Co. is 1158 Homer Street, Vancouver, B. C. The Grindley Company was the western office of Gormans Limited, Edmonton, and operated under that name up to May 1, but after that date Mr. Grindley took over the business, organized his own company and enlarged his selling staff.

Several wage adjustments have been effected by the U. M. W. executives and the officials of Scotia near Sydney Mines, which apply to machine work in narrow places and the handpick men of the Florence Colliery. The machine men have been asked to accept an advance of 10c. on the ton, and the latter class of employees 3c. The U. M. W. local decided to accept the offer under protest and will keep after the company until their full demand is met. The machine runners claim that because of paying a helper a fairly decent wage, they stand to lose themselves on the present rate of wages. All the U. M. W. locals are pressing for more money for datal men.

The Northern Alberta Coal Operators' Association, embracing all mines in the prairie country north of the Red Deer River, **has been organized** at Edmonton with C. W. Leonard, of the Chintook Coal Co., as president, and C. W. Cupples, of the Great West Coal Co. as secretary. The new organization, which represents about 25 mines, will deal with the Canadian Federation of Labor, the charter of which forbids any affiliation with the United Mine Workers of America.

A Dominion charter has been granted the **Price & Murray Coal Co., Ltd.,** head office, Toronto, with a capital stock of $100,000. The provisional directors are: W. W. Vickers, R. P. Locke, D. Magle, R. Hatton and A. Black, of Toronto.

The Toronto Board of Education has contracted for steam coal at an average price of $9.30 per ton, as compared with an average price of $8.90 last year. Contracts have been let for hard coal at $15.50 per ton as compared with $14 per ton last year.

The coal, output of the British Empire Steel Corporation for the month of May, 1923, was 457,125 tons, as compared with 308,439 tons in May, 1922. The total output of the corporation for the five months ending May 31, 1923, was 2,309,143 tons, compared with an output of 1,381,551 tons to May 31, 1922.

According to the report of the City Auditor **Toronto lost 86.3c. a ton, or a total of $6,962.93, on the 8,068 tons of emergency coal sold at $15.50 a ton.** The total amount purchased was 11,630 tons at a cost of $141,913.90. The cost of handling was $48,388.49.

A special commission of five members of the United Mine Workers of America have arrived at Sydney, N. S., from Indianapolis, authorized by John L. Lewis, international president of the U. M. W., **to make a thorough investigation of the affairs of District** 26, which includes all the Nova Scotia coal mines. The commission is instructed to take any action deemed necessary to bring the district back in line with the U. M. W. should it be found that its policies have been radically departed from.

Fire recently destroyed the boiler house and wash house at the North American Collieries plant at Evansburg, Alberta, with an estimated loss of $25,000.

MEXICO

Extensive development operations of the Rosita coal field, near Sabinas, have been started by the American Smelting & Refining Co., which purchased the property some time ago. It is reported that the company will expend more than $4,000,000 United States currency in constructing coke ovens and other improvements. According to the statements of engineers who have been exploring the coal field, there are approximately 100,000,000 tons avaliable for converting into high-grade coke. The output of the coke ovens will go to supply the smelters of the company at Monterey, Asarco, Chihuahua and Aguas Calientes.

Association Activities

West Virginia Coal Association

The annual meeting of the West Virginia Coal Association has been so timed that members may attend it and the annual convention of the National Coal Association. The annual gathering of the West Virginia Association will be at Atlantic City, Tuesday afternoon, June 19, at 2:30 o'clock, when the association will elect directors, who will select the officers of the association for another year. The usual routine business will be transacted and the policy of the association during the convention of the National Coal Association formulated. W. H. Cunningham, secretary of the West Virginia Association, who also is chairman of the convention committee of the national association, is urging all members of the local association to attend both meetings.

Obituary

Harry P. Mahaffey, 45, assistant superintendent of the Wilmore Coal Co., Windber, Pa., died on May 24th, of pneumonia, leaving a wife.

Angus Ralph Crow, widely known in the Ontario (Can.), coal trade, died at his home in Chatham, Ont., where he was for many years engaged in the wholesale coal trade. He was 63 years of age.

James D. James, 60, of Clinton, Ind., who has been in the employ of the Clinton Coal Co. for 27 years, much of that time as mine superintendent, died recently at his home. At the time of his death he was superintendent at Crown Hill mine No. 2.

John M. Manson, 55, secretary of the Deep Vein Coal Co., Terre Haute, Ind., died June 3 at St. Anthony's Hospital, Terre Haute, of injuries received four years ago when his motor car was wrecked by a street car. Mrs. Manson also suffered injuries which caused her death. Mr. Manson apparently had recovered and was active in business until two weeks before his death.

Traffic News

State railroad commissions have no authority to order intrastate rates lower than interstate rates on the same commodities even when the commodities specified are consigned to a governmental agency if by so doing there is a tendency to create a monopoly, according to a decision of the U. S. Supreme Court rendered May 21. The case at issue involved stone and gravel for public road work in Tennessee. The Interstate Commerce Commission in July, 1920, ordered a 25 per cent increase in interstate rates. The Tennessee Railroad Commission ordered similar increases on intrastate rates excepting carload shipments of stone and gravel for use in public highway construction and consigned to the State, a county or a municipality, or an agent of one of these. The railroads appealed to the Interstate Commerce Commission, which directed an increase in accordance with its first order. The Tennessee Railroad Commission applied for an injunction in the federal district court, claiming that preference to government shippers expressly was provided by Sec. 22 of the Transportation Act. Three judges hearing the case declared that discrimination in such a case was not necessarily unlawful, and granted the injunction, whereupon the Nashville, Chattanooga & St. Louis R.R. and other companies appealed the case to the Supreme Court because of the importance of the principle involved. The Supreme Court held that the facts in this specific case made it appear that certain quarries within Tennessee would be benefited by the difference in rates to an extent which would give them practically a monopoly of stone and gravel for use on road work within the state and that under these circumstances a lower intrastate rate was not proper, hence the decision was reversed.

Coal rates from Castlegate, Utah, to Malad, Idaho, on the Oregon Short Line R.R. have been reduced to $2 on slack and $2.60 on other grades. The old rate for all grades was $3.35.

Charges collected on coke in carloads from various points in the United States destined **to Cananea, Mexico, have been found by the I. C. C. not to be unreasonable.** As a result the complaint of the Greene-Cananea Copper Co. has been dismissed.

The Interstate Commerce Commission has **approved a reduced schedule of rates on nut and slack coal from mines on the St. Louis & San Francisco Ry. in Oklahoma and Arkansas** to certain destinations on that line in Texas.

During the last few months **the coal-carrying capacity of the Pennsylvania Railroad System has been increased by what is equivalent to the addition of 2,308 new coal cars** to the service. Last October orders were placed with the railroad's Altoona works to substitute 70-ton trucks for 50-ton trucks under 10,188 cars then operating in the coal service. To date there have been 6,173 cars turned out of the shops with this work completed, their carrying capacity being increased 31 per cent each by the substitution of the heavier trucks. The additional capacity thus obtained is naturally of greater advantage from an operating standpoint than if it had been secured by placing additional cars in service, as there is no corresponding increase in the number of car units to be handled in trains. When these cars were built, 70-ton capacity bodies were placed on 50-ton trucks and the load restricted to 50 tons because of insufficient strength of certain bridges on branch freight lines to carry the heavier loads. The correction of these conditions now makes possible the operation of the heavy equipment, loaded to full capacity. It is expected that work will be completed on all the cars by autumn. When this is accomplished, the coal-carrying capacity of the system will have been increased by 190,516 tons, which is equivalent to placing 3,810 new cars in the service.

The hearing in the case of the Avrshire Coal Co. vs. the Southern Ry., which was assigned for June 30 at Terre Haute, has been postponed indefinitely.

During the month of May **2,622,357 net tons of soft coal and 241,460 net tons of hard coal passed westward through the United States and Canadian canals at Sault Ste. Marie.** Of this amount 19,045 tons of soft coal and 2,100 net tons of hard coal passed through the Canadian Canal.

A report by the Car Service Division of the American Railway Association shows that **on May 15 210,243 freight cars were in need of repair. This was a decrease of 262 compared with the number on May 1.** The number in need of repair on May 15 represented 9.3 per cent of the total number of cars on line compared with 9.2 per cent on May 1.

Authority has been granted the **Virginia Railway Co. to issue $5,700,000 equipment-trust certificates.** This amount will be applied on the purchase of equipment which includes fifteen Mallet superheated freight locomotives to cost $1,208,700; 1,000 120-ton steel flat-bottom gondola cars to cost $5,000,000 and 500 steel 70-ton hopper bottom coal cars to cost $1,477,500.

In order to determine the number of cars to which mines on its system are entitled, **the Baltimore & Ohio R.R. is utilizing the services of twenty-four operators and coal-company officials** as a preliminary step toward rerating mines on that system. C. L. Chapman, for instance, general superintendent of the West Virginia Coal & Coke Co., heads a group which is engaged in inspecting the mines of the Somerset field. It will require in all about seven weeks to complete the preliminary steps toward rerating the mines. Every mine is being visited and its facilities for loading coal inspected. In making such an inspection, information as to the amount and condition of equipment, trackage, height of seam, previous performance, man power and other conditions is all being compiled.

Rates on coal from the mines of the Slogo Coal Corporation at Johnston City, Ill., to various destinations in Michigan, Iowa, North Dakota, South Dakota, Missouri, Minnesota and Wisconsin **are unreasonable,** in the opinion of John B. Keeler, an Interstate Commerce Commission examiner. In a report to the Commission, he recommends that these rates be declared unduly prejudicial to the extent that they exceed the joint rates on like traffic from the mines on the Southern Railway in the Southern Illinois group or the mines on the Baltimore and Ohio Railroad in the Belleville group, by more than the current differential between the Southern Illinois and Belleville group.

Freight rates on coal from the southern and western fields in Colorado to eastern points in the state have been slashed and slight reductions have been made in the rate from the northern fields to Denver by the Colorado Public Utilities Commission. The reduction also means lower rates to eastern points outside of Colorado. Anthracite rates from the western Colorado field reduce the spread between hard and soft coal from $1.18 to 50c. A reduction of 7c. a ton on lump and 9c. per ton on slack and pea from the northern fields to Denver has been ordered. The prevailing rate was upheld between the southern field and Denver. Substantial reductions were ordered in the rates between the southern fields and eastern Colorado. Rates from southern fields and the Canyon City district to Greeley and other Weld County points were cut from $3.40 on lump and $3.15 on nut to $3; on pea and slack from $3.03 and $2.93 to $2.70. Trinidad carries a differential of 25c. on lump and nut and 10c. on pea and slack over the Walsenburg tariffs. The present charge of $2.25 from the southern fields to Colorado Springs was lowered to $2. The rates to Pueblo and Denver, $1.76 and $2.34, were declared reasonable basic rates. Rates to Cheyenne Wells, on the Union Pacific, will now be $3.90, almost $1 lower than the old rate. To Kumer the new rate will be $3.05, and to Fort Morgan, $3.20. On the Colorado & Southern the rate to Fort Collins and adjacent points will be $3. It is ordered that shipments east of Denver must bear rates not exceeding by more than 50c. those on Walsenburg shipments. The order applies to the Union Pacific, Colorado & Southern, and C. B. & Q. railroads. A differential of $1.20 is allowed on the Rock Island line.

April net railway operating income on Class 1 railroads totaled $83,197,800, representing a return, on an annual basis, of 6½ per cent of the Interstate Commerce Commission's tentative valuation, according to a statement by the American Railway Association. In April last year the same carriers reported a net operating income of $49,979,000, equivalent to 3.99 per cent on the tentative valuation, while the net operating income for March this year was $83,487,000, or 5.96 per cent. The April rate of 6½ per cent is the highest return earned in any months since the passage of the Transportation act of 1920. Operating revenues in April were $522,955,700, an increase of more than 25 per cent, compared with the same month of last year. Operating expenses totaled $403,869,000, an increase of more than 20 per cent over the same month of last year.

The report for the Lehigh Valley R.R. for the year ended Dec. 31 shows that the company carried 23,071,515 tons of miscellaneous freight as compared with 26,377,743 tons in 1921. E. E. Loomis, president of the company, says in his report that the year 1922 will be remembered in history, from the standpoint of the railroads at least, because of the serious and continued difficulties with union labor. The miners' strike, he says, not only tied up anthracite production, but forced a considerable reduction in bituminous operations, reduced transportation earnings, and the higher price for bituminous coal greatly increased operating expenses. The strike of the shop-craft employees had its effect upon practically all carriers. Mr. Loomis says that upon the ending of the miners' strike the company concentrated its efforts upon the handling of fuel, and was able to furnish a full supply of cars at the mines served by its road every day after the resumption of mining, with the result that the anthracite loadings up to the end of the year amounted to 4,139,014 tons, an increase of 758,375 tons over the same period in the preceding year.

Coming Meetings

Iron and Steel Exposition at Buffalo, N. Y., Sept. 24-28. Association of Iron and Steel Electrical Engineers, Empire Building, Pittsburgh, Pa.

National Retail Coal Merchants' Association will hold its sixth annual convention June 25, 26 and 27 at Scranton, Pa., with headquarters at the Hotel Casey.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will hold its annual convention June 25-29, at Swampscott, Mass. Secretary F. L. Hutchinson, 29 West 39th St., New York City.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

National Coal Association will hold its sixth annual convention June 19-22, at Atlantic City, N. J. Assistant secretary, C. C. Crowe, Washington, D. C.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting lill start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

West Virginia Coal Association will hold its annual meeting Tuesday afternoon, June 19, at Atlantic City, N. J. Secretary W. H. Cunningham, Huntington, W. Va.

Mine Inspectors' Institute of America will hold its 13th annual meeting July 10-12 at Pittsburgh, Kan. Secretary, J. W. Paul, 4800 Forbes St., Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, JUNE 21, 1923 Number 25

Day Versus Tonnage Wage

AT A meeting of the Illinois Mining Institute the use of loading machines was vigorously discussed. It appears that the introduction of mechanical loaders in the Middle West, as elsewhere, is well on its way. John Garcia declared that mining practice will have to be made to conform to the machine, for the machine cannot be made to meet present loading conditions satisfactorily.

Its introduction, however, depends just as much on so adapting haulage conditions to the needs of the machine that there will be no delays. Expensive machines should not be held waiting for uncertain deliveries of cars. The operator must be prepared to keep the cars in constant supply. If he pays his men by their tonnage he has every reason to be slack in delivering cars, for prompt service is expensive. Only when the operator gets a profit from such service will he be induced to afford it. Till then he must put his interest in transportation first and his interest in the mining and loading of coal second.

If the railroads of the country owned the coal mines or the mines the railroads, the operator would get his gondolas on time every morning. The railroads would be run so that there would be no uncertainty as to this, for a steady run and a full day would be necessary if a maximum profit was to be assured. In consequence of the divorce between these elements in coal handling the railroad finds it profitable to run the business with a callous indifference to mine operation. In fact only by regarding transportation as a business in itself to be run on the most economical basis regardless of the needs of the coal mines can a profit be made from railroading.

Likewise, the mine operator with his day men runs his underground and, where he has it, his surface transportation as an end in itself. The loader can load only when he has cars. He is interested therefore in receiving car service; the operator is concerned only with the cost of transporting cars to the face, and he puts that first and service second. It is the only way to make a living. Interest him by allowing him to operate his mechanical loaders by day-wage employees and he will co-ordinate loading and transportation. He will be willing to haul wastefully to make the savings in loading that can come only by prompt and regular car service.

Today the operator no longer runs his whole mine. He has sub-contracted the mining and loading part of it. Haulage he keeps in his own hands. As sure as day follows night, the operator must run his transportation plant economically and from purely a transportation angle, which is not economical from the point of view of mining and loading. Co-ordinated interest is the only hope for co-ordinated industry. There can be no common interest where part of the business makes profit for one man and the other part makes it for another.

Realizing this and also that the speed of the machine is based on its capacity and not on the energy of its operatives and that therefore there is no longer need to hold out an incentive to them, the operator is disposed to pay his men by the day for loading, and in this his decision is good. So long as he thus pays his men he will run his transportation to suit both of his interests—his old interest in cheap haulage and his new interest, that of low-cost coal production at the face.

No one can doubt that a thoroughly mechanized mine should be on the day basis. The stationary engineer is not paid by the horsepower generated but by the hours on the job. The engine is regulated and the pressure of the steam is adjusted to provide a certain power, and though skill might be encouraged by a scale of payment rated on the power produced, as there is no labor involved, payment advisedly is made by the day and not by the kilowatt or horsepower.

In the running of a loader one man may need to be skilled and may have to use judgment to keep up the flow of cars to the machine, but there is no more need to pay him on the tonnage basis than the foreman, and as for the other men, they provide little labor and less skill. They merely remain on the job watching the machine do the work, always closely under the supervision of the boss loader and higher officials. Where, as in Orient No. 2 mine in Illinois, four machines can load out 500 tons, the work of supervision is greatly reduced and can be thoroughly performed. The work is concentrated and every item of management accordingly is simplified. No longer will mining be a work of seclusion; no longer will it pay its men on a basis of performance, for supervision will be the guarantee for faithfulness and the ease with which the work is performed will make shirking of no advantage to the indolent.

Can't Eat Your Cake and Have It Too

WHEN rates on coal were increased in 1920 the Interstate Commerce Commission ordered that differentials between competing fields be preserved. Thus when the 40-per cent increase was put into effect the amount in cents per ton was determined for one group and applied to all others meeting in the same market. As between Ohio and the so-called inner and outer crescent groups of West Virginia shipping coal into Michigan the 40-per cent increase was applied to the inner crescent and the 81c. as to Detroit on coal from Kanawha became 36 per cent on coal from Pocahontas and 50 per cent on coal from Ohio. To this the Ohio shippers, particularly those in southern Ohio, have taken serious exception, saying that no longer does the dollar buy as much transportation on Ohio coal as on that from West Virginia. The railroads originating West Virginia coal have given scant consideration to Ohio's plaint.

They have recently come to a realization, however, that they cannot eat their cake and have it too. The

advantage, by comparison, of a lower freight rate has aided their shippers, but the gain has not all been velvet. These carriers, too, notably the C. & O. and the N. & W., do not deliver coal to Michigan destinations, some 6,000,000 tons of which they originate each year. They must divide with destination roads as the P. M. and the Ann Arbor. It is on this division that the tale hangs.

The split has always been on a flat percentage basis, the originating carrier taking some 52 per cent of the base rate on *Ohio* coal. Thus when the rate on Pocahontas coal to Bay City, an average point, was increased from $2.80 to $3.84, or $1.04, the originating carrier got but $2.39 as its share, which is nearly 11c. less than the proportion formerly going to the roads south of Toledo. It has been estimated that the Southern roads thus lost nearly a million dollars per year, which the Michigan roads received, of course.

The Southern roads are asking the I. C. C. to allow them to retain as their share the same percentage not of the Ohio rate as advanced 50 per cent but as it would be if it had been advanced 40 per cent and not so many cents per ton. Ohio coal shippers are watching the outcome with pleased interest.

What Makes a College?

MANY of our big colleges are grievously overrated because they are classed solely on the quality of their product. Without attempting in any way to deny the superiority of their faculties and facilities, it seems only fair to point out that they receive good material and from it they naturally make a good fabric. Their final product is good because they start with goods of excellent quality. If to your school or college you can draw the sons of distinguished successful men you are more likely to deliver a product that will, at least, have the ability to succeed in business and in the world than if you admit men who are impelled to take up the curriculum solely because they delight in study and have a flair for learning. It is because of the quality of the men attending Yale, Harvard and Princeton, Oxford and Cambridge that these universities have such a wonderful hold on our imagination.

They draw men of character and intelligence, men who go to college only because in their station of life it is the right course to pursue. If they learn only a little, if they gain only a half of what your real night-oil student learns, it is of advantage in their after life; the quality of their character and the brightness of their intelligence will do the rest. They are quite usually not naturally students. They attend college for the companionship and the sports, because tradition has said that it is not yet time for them to dig for a living, but they have the right qualities of mind, and the education they get rounds out what they already have. In all this, however, it must not be forgotten that many sons of unsuccessful fathers nevertheless have qualities that in a sense almost predestine them to financial success or to distinction. They are, however, quite exceptional.

To those not surrounded by tradition of college attendance, who rather loathe study, we would say as forcefully as language permits, Go to college. If you have neither character nor mental brilliance, education will serve to find you a definite if not an extremely lofty place in life. If you have both and loathe study, college will give you what you will never get without it. Education is not of as much value as what you have, but it will be of inestimable value in giving you what you lack.

The wholly scholastic trend of the "plug-hard" college is perhaps to be regretted. It drives away the man whose genius is companionship, originality, intellectualism. The Gradgrind parasite who lives on other people's thoughts will never be a leader in the world no matter how many "ologies" he masters. The man who will make those "ologies" yield their power will be the man of active mind who does not live for them but makes them live for him.

What we would have the young man who does not want to go to college realize is that he is the man that needs a collegiate education and that it is just such a man that the colleges need. No curricula on management, cost accounting, history or debating will make a leader and vice-president out of a follower. Given, however, a man of leadership, a vital, inspiring, healthful, brilliant man, no matter from what origin drawn, and education will give him tools for his hand, methods for his operations, plans for his future. College for him will not come amiss. If it were not for the college campus, the river to row on, the college papers, the debating society and the glee club one may well wonder if the life at the university would appeal to any men of broad executive ability whose genius is in action rather than in study.

After all, success in business and in world affairs is only one kind of success. The lesser colleges do translate from school to lifework a wonderful quota of men of intellect, whose work in research advances the progress of the world. But the average college, especially in America, has today a somewhat different aim. Perhaps it is a little unwilling to acknowledge it, but the fact remains that it seeks to graduate men for successful business and is not satisfied unless it does, and it largely weighs itself in that balance. Moreover, the man who considers the question of going to college or of sending his sons there weighs the institution in the same way. It is not a very worthy measure, but so long as it is used for the appraisal of merit colleges must seek to attract to their halls men having the characteristics of financial success if they would graduate men whose careers will bring great business profit.

If you want to install a motor having certain characteristics you must choose one that has them. That may not be the best of motors but it is the one you are needing, and so long as you need it do not complain if a motor of other characteristics picked up at random will not give you what you want. It is so easy to recognize that all motors—series, shunt, induction, synchronous, repulsion—are not the same, but how hard it is to hold the same of men when we have tried so doggedly and so long to believe that with favorable circumstances, proper environment and intensive education we can make a man of parts and of business ability out of anyone. The ultimate redemption of the unfit by education is a pious hope that none of us can give up without a struggle.

ANOTHER EXPLANATION is that the people's representatives have no definite instructions, while the lobbyists have.—*Marion Star.*

IT IS WELL TO REMEMBER that Adam's fall came before and not after he learned to sweat for a living.—*Rochester Times-Union.*

Anthracite Workings in Western Middle Field Are 148 Per Cent Deeper Than in 1872*

Operations in That District's Seventeen Seams Grow More Difficult as Old Workings Are Reopened to Extract Coal Spurned in Early Days—Costs Steadily Mount

By D. C. Ashmead
Kingston, Pa.

A HALF century of mining Pennsylvania anthracite in the Western Middle field—a narrow territory extending from a point east of Mahanoy City westward through Shamokin to Trevorton—has proved the well-known facts that anthracite workings are growing swiftly deeper and thinner, that output per miner is growing steadily less and that the introduction of modern methods and machinery in haulage, ventilation and hoisting is reducing the number of the inside company men while greater care in coal preparation is increasing the number of men working outside.

The depth of the seventeen beds in the Western Middle field has increased no less than 148 per cent from 224 ft. in 1872 to 555 ft. in 1921 and difficulties of extraction are great not only because of this but because it is now necessary to reopen old and badly caved workings to extract coal that was left by hasty methods in effect prior to 1907. The decrease in production per man since 1872 in this district, however, is only 9.1 per cent, which is the smallest drop to be noted in any district described in this series of articles.

Data are available for more collieries in this district than in any other district described in this series. A large number of collieries in the early periods of the last century operated only a short time and then were abandoned. Evidently they mined only the cream of the coal. The large number of collieries in the early days is well brought out in the diagram in Fig. 62. In 1872 there were at least 127 collieries reported, and as the records are a little uncertain in this district in the first three periods, probably a great many more operated than are shown in this diagram. From 1872 to 1921 there is a steadily decreasing number of collieries, due to abandonment and consolidation.

In the period between 1877 and 1882 the proportion of the collieries used in the tonnage calculations is less than that of any other period. This is because a number of the collieries were so small and their data so incomplete that the available information was worthless.

From 1882 the proportion of the collieries whose data was of value is greater and as a result the tonnage curves show nothing surprising. Even in the first two periods the number of unreported collieries in proportion to the total number having complete information is so small as to have little effect on the curves, for the reasons previously set forth.

Unfortunately it was not possible to obtain from the larger companies much information regarding the thickness of the beds and the depth of the working. Therefore the depth and thickness curves give only an indication of what has happened in this region and are not at all conclusive. Only sixteen collieries in any one year furnished the data requested.

TABLE I—NUMBER OF COLLIERIES IN WESTERN MIDDLE FIELD

	Total as Reported by Department of Mines	Having Depth and Thickness Data	Having Tonnage Data
1872	127	12	
1877	110	12	78
1882	101	12	81
1887	84	15	66
1892	80	13	67
1897	71	14	61
1902	66	15	60
1907	65	15	55
1912	63	16	55
1917	61	15	55
1921-2	59	16	54

In this region the geological conditions show a marked variation from those of previously described districts. Here there are the same steep pitches that are found in the Panther Creek district and in the Eastern Middle field, but instead of the basins being V-shaped, as in these fields, the bottoms are broad and flattened out as shown in Fig. 63, which is a general cross-section of the region. This makes the section look

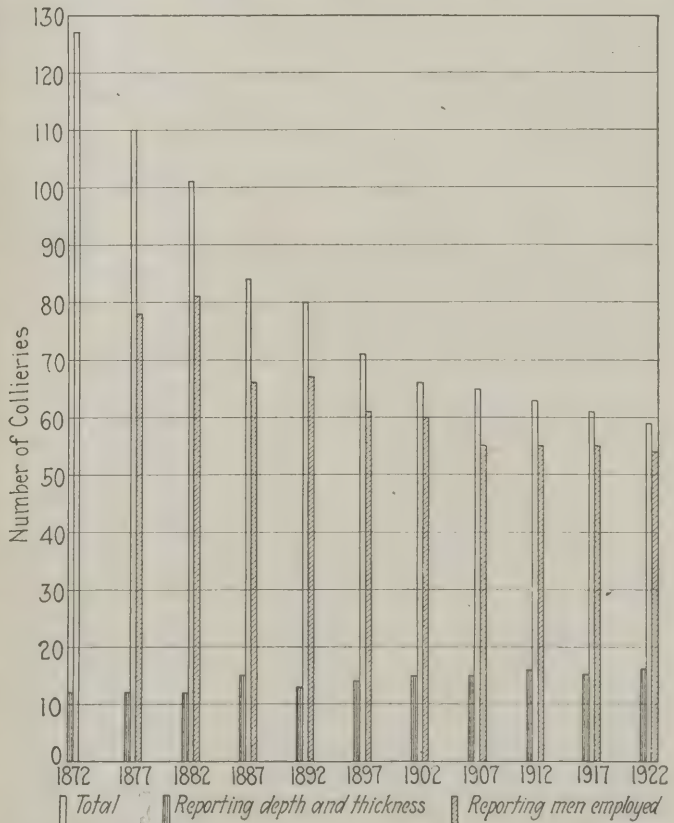

FIG. 62—NUMBER OF COLLIERIES IN THE WESTERN MIDDLE FIELD

This diagram shows the number from which statistics on depth and thickness of coal mined were available, and from which data was secured on men employed and tonnage produced, as compared with the total.

*This is the sixth in a series of articles by Mr. Ashmead describing conditions in the seven sections of the Pennsylvania anthracite region. Previous articles appeared in *Coal Age* for Feb. 22, March 22, April 5, May 10 and May 31. The seventh will appear soon.

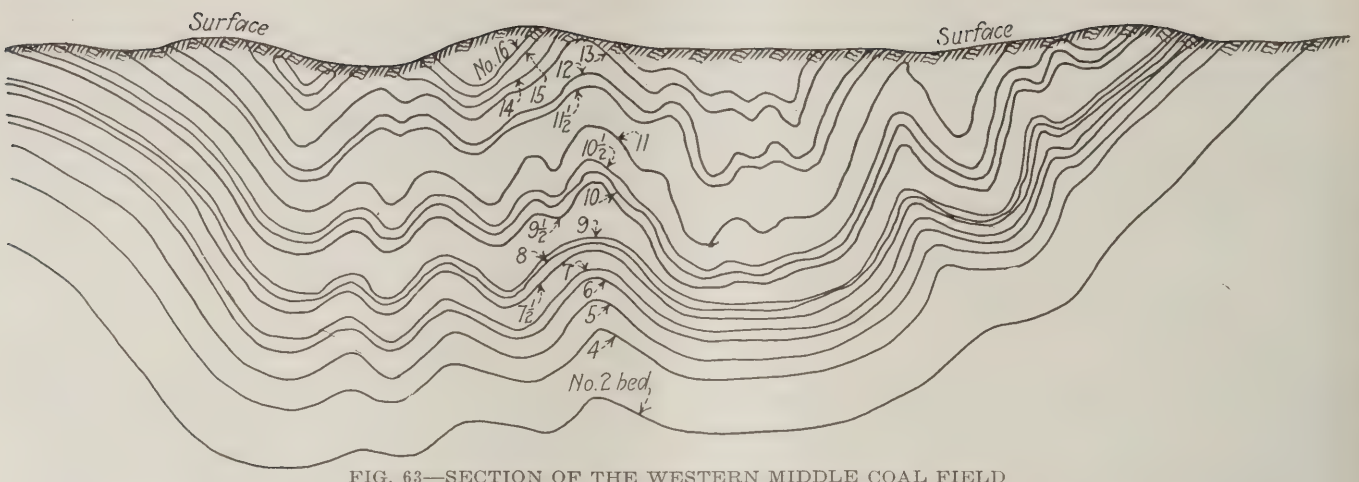

FIG. 63—SECTION OF THE WESTERN MIDDLE COAL FIELD

This section shows that the measures are generally steeply pitching, but that at the bottom, the basin, instead of having sharp angles, is flattened out.

something like two "U"s standing side by side with the middle members extending only half way to the top.

Coal beds in this region are more numerous than in either the Eastern Middle field or the Panther Creek district but are thinner. In the sixteen collieries reporting on thickness only two reported beds as thick as 30 ft.

The names of the beds from the surface downward are as follows: Little Tracy or No. 16, Big Tracy or No. 15, Diamond or No. 14, No. 13½, No. 13, Orchard or No. 12, Primrose or No. 11, Top Holmes or No. 10½, Bottom Holmes or No. 10, Mammoth or No. 9, No. 8½, No. 8, No. 7½, Skidmore or No. 7, Seven Feet or No. 6, Buck Mountain or No. 5, and Little Buck Mountain or No. 4. Although the basic information is not complete, the thickness curve in Fig. 64 takes the same general shape as the thickness curves of the previously described districts. This indicates but does not prove that the thickness of the beds has decreased. In 1887 the data from some of the collieries reporting were not complete but the available data were from collieries which had reported thick beds in 1882 and in 1892. Therefore it is reasonable to suppose that the curve really decreased as shown in the dash line instead of the solid line.

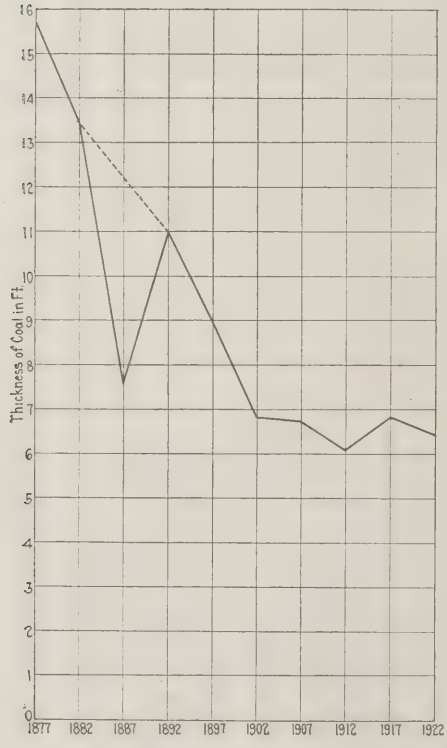

FIG. 64—AVERAGE THICKNESS OF COAL MINED IN THE WESTERN MIDDLE FIELD

The methods used in the calculation were explained in the caption under Fig. 3 in the issue of *Coal Age* for Feb. 28, 1923.

In studying Fig. 65 it will be seen that even in 1872 beds of coal as thin as 2 to 3 ft. were mined. Evidently the mining of this thin coal was not considered profitable, for in 1877 it was not reported. In 1902, however, over 11 per cent of the beds were less than 3 ft. thick, and this percentage increased to 13 per cent in 1922. Although there are comparatively few observations used in the preparation of this curve, the general tendency is for thick beds to decrease in number and thin beds to increase.

The general shape of the curve for depth of workings is like the teeth of a saw. There were not a sufficient number of observations to smooth out the curve, but the general characteristics are shown. Here the curve shows that workings steadily grew deeper, and if a general curve were drawn to do away with the irregularities, it would be found that in 1877 the depth was 224 ft. and by 1921 this average depth had increased to about 555 ft., an increase in depth of 331 ft., or about 148 per cent. In the earlier periods, particularly during the seventies, when the easily procured coal in each mine was extracted the colliery was abandoned. This accounts for the rapid increase in the depth of

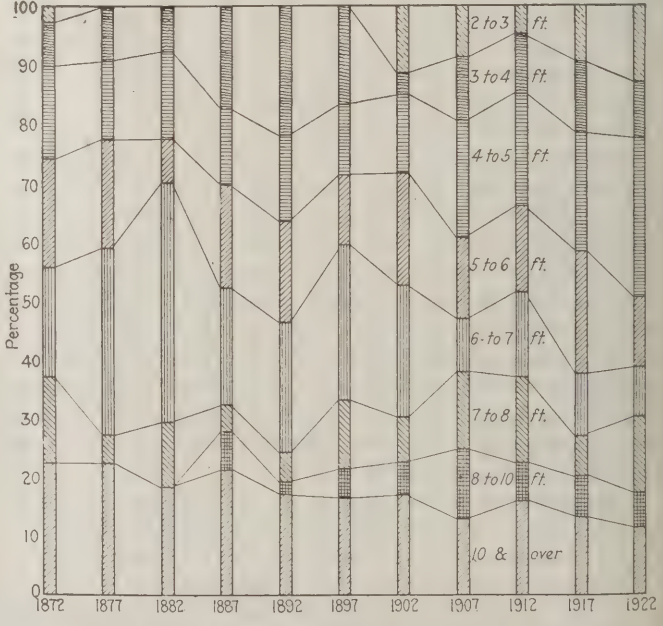

FIG. 65—PERCENTAGE DISTRIBUTION OF NUMBER OF BEDS WORKED BY THICKNESS IN WESTERN MIDDLE FIELD

A description of the methods used in calculating this curve are shown in the caption under Fig. 4 in the first article of this issue, appearing in *Coal Age* for Feb. 22, 1923, on page 324.

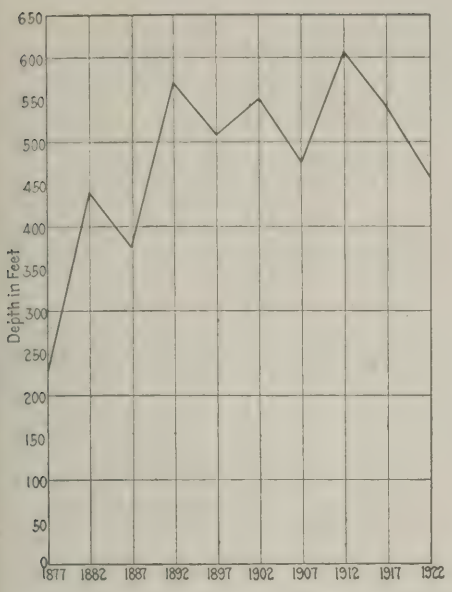

FIG. 66—HOW DEPTH OF WORKINGS HAS CHANGED IN THE WESTERN MIDDLE FIELD

The description of the methods used in the calculation of this curve will be found in the caption to Fig. 5 in the Feb. 22, 1923, issue of *Coal Age*, on page 325.

the workings for the early periods. If the imaginary curve is considered it will be seen that from 1887 such a curve would flatten considerably, for in that year the average depth was about 420 ft. as against 555 ft. in 1921. This was an increase of 135 ft., or only 32.1 per cent, as against an increase of 148 per cent for the full period covered by the curve. Fig. 67 shows the percentage of workings at various depth intervals. A continual increase took place. In 1872 the deepest workings lay in the 400 to 500 ft. interval, but by 1922 workings were reported as deep as 1,400 ft. and in 1912 one colliery reported workings between 1,600 and 1,700 ft. deep.

The change in bed thickness at various depth intervals is shown in Fig. 68. Even though there were insufficient data available, the thickness curve is downward almost uniformly. The thickness of the beds is less than that of the Eastern Middle field and the Panther Creek district.

Reports of state mine inspectors of the amount of boiler-horsepower installed go back only to 1887, the first year that the electric locomotive was used in anthracite mines. In the period 1887 to 1897 inclusive there was produced daily about 0.9 ton of coal for each boiler-horsepower. But in the periods ending 1902 and 1907 there was a considerable drop in this figure. This probably was due to the increased depth of workings and the extension of underground workings as well as to increased production. But from 1907 onward production remained practically constant. This was in spite of the fact that the depth of workings continued to increase and the thickness of the beds continued to decrease. It can be explained by pointing to the introduction of electricity. During this period there was a considerable increase in the use of electric power. This resulted in power economies. Further, a number of the coal companies, instead of installing modern boiler houses and power plants at their collieries, discontinued the old out-of-date plants and purchased their power from central stations. As a result, power consumption per ton of coal did not change materially.

TABLE LI—AVERAGE DEPTH AND THICKNESS OF COAL MINED IN THE WESTERN MIDDLE FIELD, IN FEET

	Average Thickness Of Beds	Average Depth of Workings		Average Thickness Of Beds	Average Depth of Workings
1877	15.77	223	1902	6.84	552
1882	13.4	441	1907	6.74	684
1887	7.53	375	1912	6.55	608
1892	11.02	570	1917	6.81	543
1897	9.00	518	1922	6.47	459

TABLE LII—POWER USED IN THE PRODUCTION OF COAL IN THE WESTERN MIDDLE FIELD

	Boiler Horsepower Installed	Engine Horsepower Installed	Tons Produced Per Boiler Horsepower	Tons Produced Per Engine Horsepower
1887	48,570	.....	0.853	.....
1892	53,250	.....	0.944	.....
1897	70,000	.....	0.946	.....
1902	89,044	120,884	0.722	0.532
1907	107,395	106,660	0.560	0.564
1912	112,745	178,011	0.557	0.353
1917	115,850	195,149	0.566	0.336
1922	106,388	.....	0.540	.....

Data on haulage is incomplete for the periods previous to 1887, so it is impossible to use these data for the early years. Since 1887 the daily average hauled per mule shows a steady increase; this, however, is not due to any increased efficiency on the part of the mule but entirely to the introduction of the electric locomotive. Part of it, however, may be due to better track layout and maintenance, the introduction of heavier rails and increased use of roller bearings. All of this would tend to increase the amount of coal hauled per day either by mule or locomotive.

Sometime before 1902, according to Fig. 70, the electric locomotive was first used in the Western Middle field, and the increase in its use has been steady, as is shown in the curve and the figures given in Table LIV. The tonnage hauled per locomotive, however, has gradually decreased as the electric locomotive has changed from exclusively main-line haulage to gathering. Both cable-reel and storage-battery locomotives are in this service.

From a study of the mine inspectors' reports from 1872 to date one comes to the conclusion that there have been three distinct divisions in the history of the past 50 years of the Western Middle field with the dividing points in 1887 and 1907. In the early division a colliery was opened for a short time, the best coal mined and the operation then abandoned. This division seemed to end at about 1887. Then came a time of adjustment. Mining methods changed, colliery operation became more stable and the consolidation of collieries began.

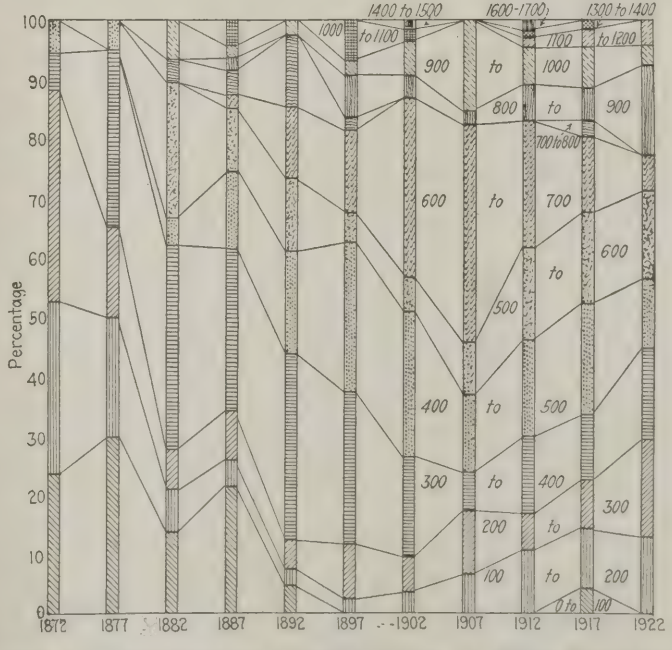

FIG. 67—PERCENTAGE DISTRIBUTION OF BEDS WORKED AT EACH 100-FT. INTERVAL OF DEPTH

In the caption to Fig. 6 on page 325 of the Feb. 22, 1923, issue of *Coal Age* will be found the description of how this curve was obtained.

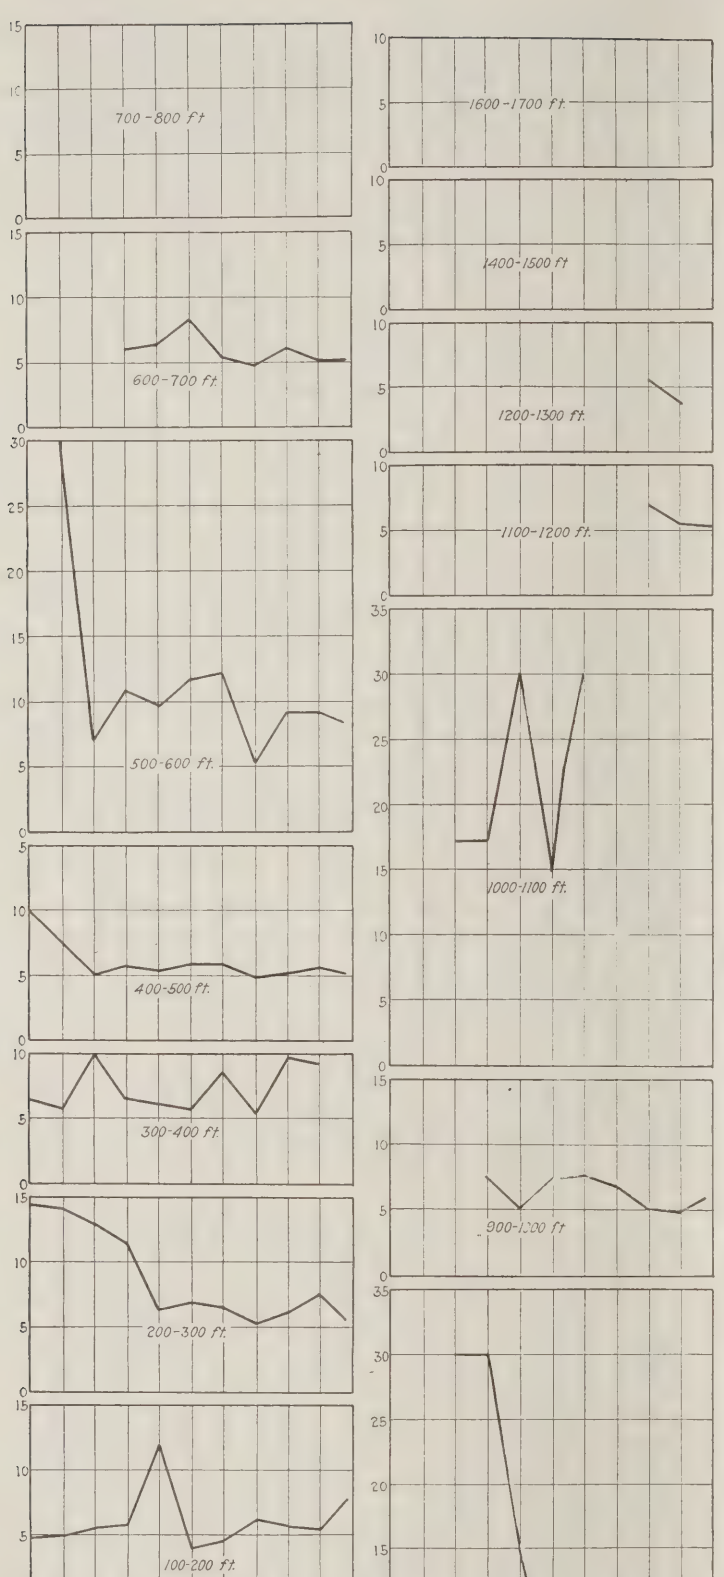

FIG. 68—AVERAGE THICKNESS OF BEDS AT EACH 100-FT. INTERVAL OF DEPTH IN THE WESTERN MIDDLE FIELD

A description of the method used in preparing this curve will be found in the caption to Fig. 7 in Part I of this series, on page 326 of *Coal Age* for Feb. 22, 1923.

This seems to have lasted until about 1907, when the time of modern mining began. Of course all of these divisions overlapped but the dividing dates are accurate, taking the field as a whole. One of the indications that these general changes took place is the curve for the daily average production per employee. The final curve, which is the dot and dash line in the bottom group of curves in Fig. 71, shows a decided drop in the period 1877 to 1887, but from 1887 to 1907 the line is practically level but showing a slight downward tendency if the 1897 figures are omitted because of errors that year in state inspectors' reports. The drop in output per man is only 0.04 ton a day. Then from 1907 to 1921 there is a considerable increase in the production per man from 1.50 tons to 1.80 tons.

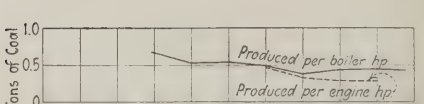

FIG. 69—DAILY PRODUCTION OF COAL PER BOILER HORSEPOWER AND ENGINE HORSEPOWER INSTALLED

The method of calculating these curves is found under the caption to Fig. 8 in the issue of *Coal Age* for Feb. 22, 1923, on page 327.

The total change in production from 1877 to 1921 is a decrease of 0.18 ton, or 9.1 per cent. This decrease in output is less than in any of the previously described districts, for the Lackawanna County district shows a decrease of 31.2 per cent, the Wilkes-Barre district, 30.2 per cent, the Nanticoke district 21.1 per cent, the Eastern Middle field 30.6 per cent and the Panther Creek district an increase of 1.6 per cent, or—if 1892 data is used—a decrease of 12.5 per cent.

The dot and dash line in the middle group of curves in Fig. 71 is the final corrected line showing the average daily output per inside employee. This curve shows a steadily decreasing output from 1877 to 1907 but an increase after that. The decrease before 1907 is in conformity with the results in previously described districts, but the increase in the last three periods in the production per man does not compare with what has been shown before. This increased production has been influenced to some extent by the introduction of electric haulage underground and also slightly by the increased use of mechanical mining devices. The uppermost set of curves in Fig. 71 shows the average daily output per outside employee. Here, as is to be expected, in the earliest years there is a decrease in production, and then as preparation of coal gradually turned from hand work to mechanical there was a marked increase. This increase begins with 1892 and extends to 1921.

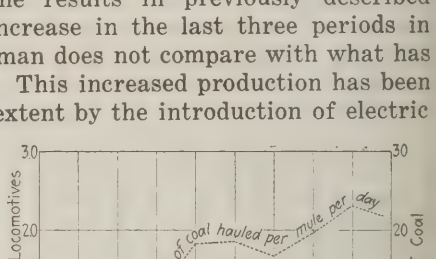

FIG. 70—AVERAGE DAILY TONNAGE HAULED PER MULE AND NUMBER OF UNDERGROUND LOCOMOTIVES PER 100,000 TONS IN THE WESTERN MIDDLE FIELD

A description of the methods used in the calculation of these curves will be found in the caption to Fig. 9 in Part 1 of this series of articles, appearing in *Coal Age* of Feb. 22, 1923.

In Fig. 72 the lowest set of curves shows the average daily output per miner and miner's laborer. From 1877 to 1887 there was a sharp drop. If 1897 is ignored, for reasons explained in preceding articles in this series, then from 1902 to 1921 there is a slight decrease in output, discounting also the production during

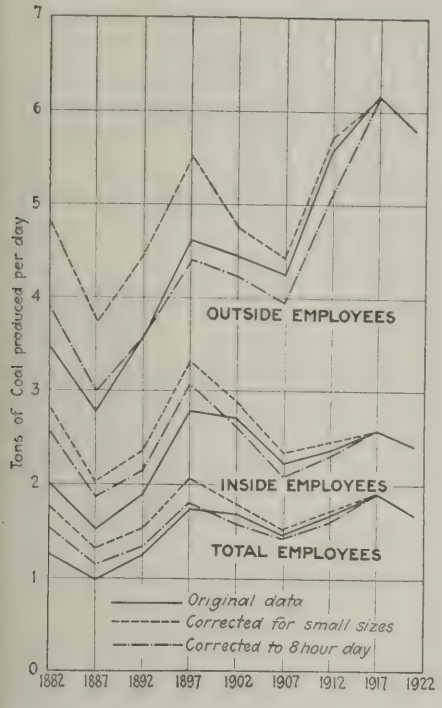

FIG. 71—AVERAGE DAILY PRODUCTION OF COAL PER EMPLOYEE IN THE WESTERN MIDDLE FIELD

This curve gives the average daily production per outside employee, per inside employee and per total employee. A short description of the methods used in the calculations of these curves will be found in the caption to Fig. 10 in the first article of this series, appearing on page 327 in the Feb. 22, 1923, issue of *Coal Age*.

the war year of 1917. Then this curve conforms with the results that have been found in the districts previously described. In fact this district comes close to the average of the other districts in the amount of the decrease in the production per miner and miner's laborer. In the Lackawanna County district the decrease in output was 43.7 per cent; Wilkes-Barre district, 42.9 per cent; Nanticoke district, 54.2 per cent—the greatest decrease in the anthracite region—Eastern Middle field, 37.9 per cent; Panther Creek district, 27.9 per cent—the lowest decrease in the whole region—Western Middle field, about 41.9 per cent, which is close to the average.

As an example of the change in mining conditions from old to new there exists a condition at one of the collieries in this district which is typical. According to the mine maps, the Mammoth bed of coal had been completely worked out and robbed. While making an estimate of the coal remaining in the property an investigation showed that this bed was about 24 ft. thick over the property and that in the old mining they had taken only 8 ft. of the best coal and the rest had been left behind as valueless. In this whole area not only had first mining been done in the 8 ft. of coal but also second mining had been completed and the top brought down.

The Mammoth bed has been opened up again and the remaining 16 ft. of coal is now being removed. It is more difficult to remove this coal than if there had been

TABLE LIII—AVERAGE DAILY TONNAGE HAULED PER MULE AND NUMBER OF UNDERGROUND LOCOMOTIVES PER 100,000 TONS OF ANNUAL PRODUCTION

	Tons Hauled Per Mule	Number of Underground Locomotives Per 100,000 Tons Annual Production		Tons Hauled Per Mule	Number of Underground Locomotives Per 100,000 Tons Annual Production
1887	15.01	....	1907	17.18	0.23

no mining done in the seam. This therefore means that the production per miner and miner's laborer is lower in this bed than it would be if the coal had not been touched or if first mining had been completed only in the full bed.

Conditions like these are found in many parts of not only this district but others. Areas of coal have been left behind because the coal was not of a sufficiently high quality or because it had become thinner. The coal surrounding it had been completely mined and the roof caved, the virgin coal left behind being rendered much more difficult of recovery. All of these things tend to reduce the production per miner and miner's laborer and therefore per employee. The curve for average daily production per inside company employee presents a saw tooth appearance. If 1897 reports are considered valueless, however, and the average for 1892 and 1902 is taken instead, the curve assumes a more natural

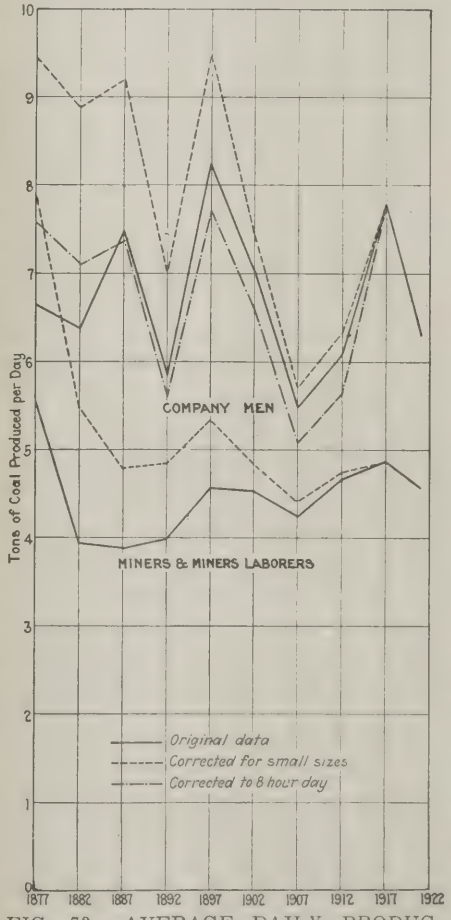

FIG. 72—AVERAGE DAILY PRODUCTION FOR INSIDE EMPLOYEE IN THE WESTERN MIDDLE FIELD

In the issue of *Coal Age* for Feb. 22, 1923, on page 328 the description of the method used in the calculation of these curves is given.

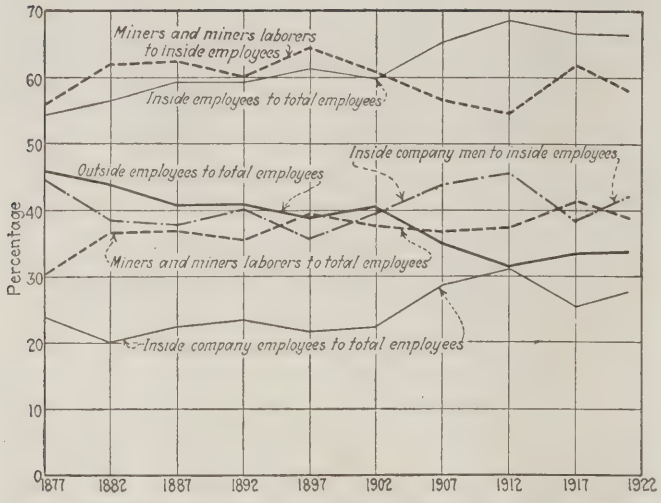

FIG. 73—PERCENTAGE OF EMPLOYEES BY CLASSES IN THE WESTERN MIDDLE FIELD

The data for these curves were obtained from the mine inspector's reports of the Pennsylvania Department of Mines.

shape. Here then we have a generally decreasing average daily output per man from 1877 to 1907. But from 1907 to 1921 it increases if the production for the war year 1917 is properly discounted. This increase in the production per man probably is influenced to a considerable extent by the introduction of underground electric-locomotive haulage. This naturally tends to decrease the number of mules and consequently, the drivers.

With the introduction of underground mechanical haulage it has become possible to haul the coal underground longer distances with more convenience than on the surface. This has led to consolidation of mine openings and therefore hoisting engines for numerous slopes and shafts have been abandoned, thus decreasing the number of engineers.

Another cause for the decrease in the number of underground employees is the use of mechanical means for caging mine cars. At some mines it is possible by the use of such mechanical caging devices to cut in half the number of men required for this purpose. At some mines the introduction of the automatic mine door has done away with a number of door boys which otherwise would be needed. The construction of overcasts has to some extent done away with a number of door boys in the mine. The design and construction of central pumping plants has reduced the number of pumpmen. Each of these factors in itself effects only a small saving but all together they substantially reduce the size of company payrolls.

Fig. 73 shows the relationship between the different classes of employees. As in all previous cases there is a steadily increasing proportion of inside employees to total employees. For the same tonnage the number of outside men required is steadily decreasing as new improvements are made in the methods of preparing coal for the market. For a long period the proportion of inside company men, miners and miners' laborers increased, but in the last few years the increase has been confined to the miners and miners' laborers, whereas the inside company men have decreased. This has been brought out in detail previously in this article.

TABLE LVII—AVERAGE DAILY PRODUCTION OF INSIDE MEN IN GROSS TONS

	Miners and miners' Laborers		Inside Company Men

* Percentage to inside employees.

How Roller-Bearing Wheels Reduce Operating Costs*

By P. B. Liebermann
Industrial Engineer, Hyatt Roller-Bearing Co., Harrison, N. J.

PROMINENT among the claims of the present users of roller-bearing trucks are that they afford an economy in power. Roller bearings will use only 50 per cent of the power that would be needed to haul plain-bearing cars of the same gross weight. As cars with roller bearings are easily pushed by hand the men who have to handle them are better contented and more productive, and where mules are used for haulage their general condition and endurance measured in cars hauled is observed to be bettered.

By the introduction of roller bearings more trips have been hauled and more cars per trip. The easy-running roller-bearing trucks have decreased the maintenance charges of haulage and of gathering locomotives. Mine trucks equipped with roller bearings of the flexible type have been found to start with an expenditure of about one-fifth of the power needed to start plain-bearing cars of the same size. All this means that the strains on cars, motors, storage batteries, mules or miners—whichever furnish the motive power—are greatly reduced. Where mechanical power is used the repair bills are much lowered.

The cost of lubricating roller-bearing trucks is one-fifth of that of lubricating an equal number of trucks equipped with plain bearings, for roller-bearing trucks require lubrication as an average only three or four times a year. The lubricant stays in the wheels and does not leak onto the ground. This efficiency is aided by the fact that wheels equipped with roller bearings

*Article entitled "Roller-Bearing Mine Trucks," read before Illinois Mining Institute.

cannot gauge out in the hub. In consequence they do not get wobbly. Hence, wrecks due to worn wheels are practically eliminated.

Where correctly housed and handled with reasonable care roller bearings give satisfactory service over an extended period. Some which have been in operation from twelve to fifteen years are still in serviceable condition.

The power-saving advantages which roller bearings afford have been recognized in a practical way for many years, but in order to have absolutely authentic proof of their value the Hyatt Roller Bearing Co. several years ago constructed a dynamometer car by which tests were conducted at a number of coal mines under actual operating conditions. The average power saving was shown to be 53¼ per cent on level track, under average haulage conditions.

The adoption of roller-bearing trucks in general and the dynamometer tests in particular had a highly educational effect in so far as they emphasized the importance of related subjects, such as the keeping of mine tracks in good condition with rails fairly clean, and the arrangement of grades so as to get the greatest benefit out of the use of roller-bearing equipment.

Equal Tractive Effort Going and Returning

As far as grades are concerned the consumption of power naturally is least under "equalized conditions" of drawbar pull—that is, when the grades are such that the same effort is required to move a train of loaded cars out of the mine as it takes to move an empty train in. Under these circumstances the capital invested in the whole haulage system is a minimum. By comparing the train resistance for the different types of wheels it is obvious that different grades are needed, depending upon the type of bearing used. The "equalizing grade" for plain-bearing cars is about twice as steep as the grade for roller-bearing cars and the necessary size of locomotive as well as the power consumption is correspondingly greater.

It is evident that not every mine can be laid out for the ideal grade but at the same time it is surprising what can be accomplished by the gradual elimination of existing steep grades. These are a continual source of trouble and expense and it is frequently less costly to accomplish a permanent remedy than to drag along day after day under adverse conditions.

It can easily be seen that a power saving can be accomplished by the use of roller-bearing cars on any grade which may occur in a mine, but the steeper the grade the more the bearing friction becomes overshadowed by the effect of gravity. Consequently, no great increase in train length or production can be expected when the loaded cars must be hauled up a continuous steep grade, but where the gradients do not exceed 5 or 6 per cent roller-bearing cars readily show the gain which their easier running qualities afford.

Assuming that roller-bearing trucks are adopted and that full advantage is sought from the ideal grade that goes with them, the question then arises what that grade is. This can be determined from the formula given on page 1,057 of Bulletin No. 127, July, 1917, American Institute of Mining Engineers, namely:

$$G = \frac{(W_L + R_L) - (W_E + R_E)}{20\ (W_E + W_L + 2M)}$$

Where, G = percentage of the desired grade; W_L = weight of a train of loaded cars in tons; R_L = train resistance of loaded cars in pounds per ton; W_E = weight of a train of empty cars in tons; R_E = train resistance of empty cars in pounds per ton; 20 = gravity force in pounds per ton per 1 per cent of grade; and M = weight of locomotive in tons.

In the same bulletin a typical haulage problem was solved which gave for the plain-bearing trucks an equalizing grade of 0.61 per cent and for the roller-bearing trucks a grade of 0.284 per cent. The roller-bearing grade is enough to allow of proper mine drainage and where it can be installed will be entirely practicable in all other respects.

As has been stated, the saving in power and lubrication effected by roller-bearings is appreciable. Furthermore, the lower roller-bearing grade will permit of the use of smaller locomotives, which in turn means lighter rails. This saving also affects favorably the electrical transmission line, transformers and power house. On account of the reduced drawbar pull, derailments are less frequent, the locomotives are operated with greater safety, car and tracks are subject to less wear and the size of the repair shops can be reduced.

The running gear of mine cars varies greatly. There are wheel hub bearings, bearings in outside boxes and bearings in inside boxes, depending on the location of the bearings in relation to the wheels. Besides this there are axles with two loose wheels, axles with one tight and one loose wheel, axles with two tight wheels and axles split in the middle with one wheel on each half.

These different arrangements of bearings and axles undoubtedly will affect the train resistance, particularly on curves. The dynamometer tests, for obvious reasons, were conducted on tangent track, and therefore information on the individual superiority of any one construction over the others was not obtained.

Generally speaking, wheel hub bearings are preferred by mine operators on light mine cars, say up to 3 to 4 tons' capacity, whereas bearings in journal boxes are specified for the heavier cars.

The application of roller bearings to mine trucks does not require any fundamental alterations in the construction of the wheels, axles, or truck body, nor does it involve any important changes in manufacturing methods for the mine-car builder. In their ease of installation, operation and inspection, the Hyatt roller bearing closely resembles plain bearings. It even allows a liberal side play to the axle, which it so much desired by operators because this play makes trains run more easily and with less wear and tear on cars and tracks and also with fewer derailments.

Wheels equipped with roller bearings differ from ordinary plain bore wheels by having a somewhat larger hub diameter. The front end of the hub is mostly constructed to form an enclosure for the bearing and it serves to retain the wheel on the axle by means of an open or enclosed linch pin or key block. The rear end usually is open, which allows machining from this side on a boring mill. Into the bore is inserted a lining of cold-rolled steel. The rollers are self-contained and after being placed in the hub the latter is closed by means of an end plate or cap of suitable design.

The side thrust on these wheels is taken in the same way as on plain bore wheels—that is, by means of one or more loose washers inserted between the rear end of wheel hub and the axle box. The loose washers have a tendency to reduce friction at this place and to equalize wear and reduce it to a negligible quantity.

When roller bearings were first applied to mine-car wheels they were installed according to the practice

followed in the installation of wheels having a plain bore. So, for instance, the center of the bearing was located perpendicularly over the center of the rail. It was soon found, however, that such a construction was faulty both for roller-bearing and plain wheels, inasmuch as it was observed that the bearings and axles showed signs of wear toward the rear of the wheel. The center of the bearing was then shifted until the load appeared to be distributed uniformly all over the bearing seat. In this event it was found that the center of the bearing coincided with the gage line of the track and therefore this arrangement has been followed ever since.

To obtain proper stability for the wheel itself the length of the bearing should have a certain definite relation to the wheel diameter. For instance, it has been found good practice to install a bearing 6 in. long in a wheel of 12-in. diameter, a bearing 7 in. long in a wheel of 14- or 16-in. diameter and two bearings 4 in. long in a wheel of 18-in. diameter.

The journal boxes should by all means be self-aligning in order to allow the box at all times to follow the axle unaffected by distortions of the truck body. The bearing is retained in a journal box in the same way in which it is housed in a wheel hub—that is, the box has one open and one closed end. The open end is covered by means of a plate or cap of suitable design. Some of the heaviest mine cars have springs put over the journal boxes which equalize the load on the bearings and greatly increase the life of the mine cars as a whole.

High-Carbon Heat-Treated Car Axles Favored

The axles which are recommended are of 0.40 to 0.50 per cent carbon-content steel. Low-carbon axles should never be used, for they will wear infinitely quicker than those with a higher carbon percentage. The slight additional cost of the 0.40 to 0.50 carbon steel is insignificant when considering the wonderful increase in the life of the whole equipment. The steel should preferably be cold-rolled, not machined, at the seat of the bearing. The limits of diameter within which such steel is furnished commercially are such as to make it possible to use the product of the mill with entire satisfaction without any machining operation except the cutting of the steel into proper lengths and the drilling or grooving of it for the retention of the wheels.

Much progress has been made of late in the use of heat-treated axles. These have quite an advantage over ordinary axles and are desirable for the following reasons: (1) They have many times the strength of an ordinary low-carbon axle. The chance of bending or breaking in service is comparatively remote. (2) They are ductile enough if properly tempered, to make them withstand the shocks and abuse of ordinary mine service. (3) On account of the thorough intermixing of the carbon with the iron, the wear at the journals is negligible without necessarily causing additional wear in the wheel hubs or bearing boxes.

The advantages to be derived from heat-treated axles for mine cars were not appreciated until a few years ago, when the ever-increasing demand for greater load capacity, for greater speed and quite often for longer trips set up a demand for better axle material. The advantages arising from their use are well illustrated by the experience of a prominent producing company which stated that "before using heat-treated axles, we sold about a car and a half of scrap axles every year, but since we have been using heat-treated axles we have not sold one in seven years."

Roller bearings must be lubricated in order to reduce the wear of the rolling surfaces to a negligible minimum and to prevent the formation of rust. The thinnest lubricant would be the most efficient, but on account of unavoidable leakage it would be the least economical and therefore heavier lubricants are recommended. Such heavier lubricants are really liquid greases. Lubricating greases are mineral oils which are artificially thickened by dissolving soap in them.

Lime, soda or lead soaps made with various fats and oils usually are employed for this purpose. The lime soaps are preferable for mine-car service because they can be used without harmful results when moisture is present. It is essential that a high-grade mineral oil be used in a grease for roller bearings and that there be present no free alkali or free acid. Most greases contain a trace of the latter. The maximum quantity of free acid should not in any case exceed 0.25 per cent. In general, a suitable lubricant should have the following requirements: (1) It must not produce any corrosive action either originally or through deterioration. (2) It must be liquid enough to flow between the rollers at ordinary temperatures and also at lower temperatures down to at least 10 deg. F.

The economy of a suitable lubricant applied to a correctly housed roller bearing is remarkable. Three or four fillings per year as an average are all that are necessary for Hyatt bearings.

If the cars are lubricated three times a year it means that the cost of grease will be about $1.20 per car per year, figuring on the application of one pound of grease to each wheel each time a car is greased, or, in other words, a total of 12 lb. of grease would be used, which can be bought at an average price of 10c. per pound.

The cost of applying the grease has been determined by mine operators as being in the neighborhood of 30c. to 40c. per car per year, so that the total cost of lubricating a car for a year would be approximately $1.50 to $1.60. Some operators lubricate their Hyatt-equipped cars for as little as 70c. a year.

Extended oiling periods—that is, the lubrication of cars once every nine or twelve months—are purposely not recommended for the reason that it is felt that the operator sacrifices several years of life in an endeavor to save a few cents per car per year. It is better to waste a little lubricant than it is to jeopardize the success of the equipment.

It has been developed by a number of operators that it costs in the neighborhood of $4.50 to $5 to lubricate a plain-bearing car for a period of one year. These figures include the cost of labor and black oil, which is the lubricant commonly used.

In conclusion, it is only fair to say that during the early stages of the use of roller bearings all the advantages claimed were not realized to the same degree as they are now. The construction of the bearings themselves, the wheels, journal boxes, axles, lubricants, etc., all had to be developed and improved to take care of the severest mine-haulage conditions and to keep step with the general progress in truck building that took place at the same time.

By persistent efforts all weak spots were eliminated to such an extent that during the past six or seven years nothing has happened to indicate that there is anything that could be done to improve the methods of manufacture and the subsequent operation of the trucks.

Quick and Simple Way of Testing for Carbon Monoxide In the Blood or in the Atmosphere

Qualitative Test Takes Three Minutes, Quantitative Fifteen—Blood Carefully Mixed with Water and Treated with Tannic and Pyrogallic Acid—Pollution Determined by Comparison of Color with Standards

By N. C. McLoud
Baltimore, Md.

SUCCESSFUL combat against carbon monoxide, the most insidious and one of the most deadly of poisonous gases, is involved in a momentous discovery just announced by the U. S. Bureau of Mines.

The greatest danger from this gas in the past has been due to the impossibility of detecting its presence. The gas is colorless and has no odor or taste in the percentages usually encountered. For this reason, victims of the poison have no way of knowing whether they are exposed to the gas until the toxic effects are well under way. Diagnosis of the poisoning has been difficult for the reason that carbon monoxide often appears in unsuspected places and may be absent where it might be expected, and further, because the symptoms of this type of poisoning are the same as those caused by other forms of ailment.

Through investigations conducted by technical experts for the government, detection of the gas and diagnosis of the symptoms have been greatly simplified. For some time past the Bureau of Mines has been conducting reasearch work on this subject. As a result, means have been found by which it is possible to discover within three minutes the extent to which a person has been affected by carbon monoxide. Formerly the presence of the gas could be diagnosed only after from 24 to 48 hours, even when the services of a hospital or well-equipped laboratories and a skilled chemist were available.

Under the new method the test is effected by the use of a simple and inexpensive instrument which may be carried in the pocket and which requires no special training for its operation. It is expected that many lives will be saved by a general adoption of this mode of finding gas poisoning, not only in the mining industry but also in other fields where this gas is a menace. With this quick method of diagnosis it is possible promptly to put in operation the proper emergency treatment, a course impossible without a rapid diagnosis.

The widespread danger from monoxide is clearly recognized. It exists in countless places, from coal mines to homes in which gas is used for heating and cooking. It is generated by the imperfect combustion of explosives. It is found in the atmosphere around coke ovens, in the smoke from burning buildings and in garages where poor ventilation permits the accumulation of the exhaust gases of automobiles. Citizens in all walks of life are subject to possible exposure to the deadly fumes, and because of this the new instrument is expected to be generally used by physicians, according to Dr. Hubert Work, Secretary of the Interior and a former president of the American Medical Association.

It is stated by the Bureau of Mines that the only infallible test for carbon-monoxide poisoning is by examining the blood. The instrument devised for this purpose and the method of its use have been evolved by Dr. R. R. Sayers, chief surgeon of the Bureau, with the collaboration of W. P. Yant, chemist at the Pittsburgh Experiment Station. For detecting the presence of the gas in air the method consists primarily of taking a sample of normal human blood, diluting it with water and shaking the mixture into equilibrium with the gas. By this means the amount of carbon monoxide in the air may be determined in low concentrations to an accuracy within one-tenth of 1 per cent. The same apparatus can be used for determining carbon monoxide in the blood of a supposedly poisoned patient. The apparatus is simple, portable and compact, and the making of determinations requires no special skill.

Many methods for the detection of carbon monoxide in the blood have been developed, but owing to their various individual disadvantages, they have never come into common use. Some of the quantitative methods are satisfactory from a standpoint of accuracy, but require elaborate and expensive apparatus, special technique and training, or are too delicate and cumbersome for field use. The Bureau's instrument overcomes all these obstacles and affords an apparatus which should not cost, at the outside, more than $25 or $30. A statement prepared by the Bureau says:

"It is of vital importance in all industrial and domestic accidents occuring at places where carbon monoxide might be suspected or where the symptoms are typical of carbon-monoxide poisoning, that a qualitative and, preferably, a quantitative determination be made to show the presence or absence of carbon monoxide. The latter is preferable because the extent of the poisoning is of importance in deciding whether carbon monoxide is a direct or contributory cause. This is, indeed, essential from a medical standpoint, as it aids in prescribing treatment, and, from a legal standpoint, to insure justice in the claims that are often unjustly decided for want of positive evidence.

"In view of the foregoing, an apparatus has been designed which gives accurate results in the field and

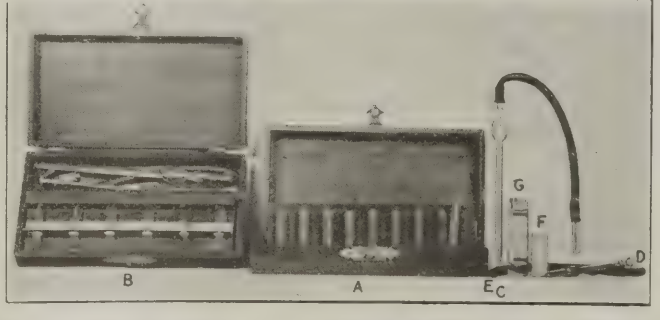

FIG. 1—KIT TO TEST FOR CARBON MONOXIDE IN BLOOD
A, tube of sample colors for comparison with that of the test sample; B, test tubes for preparing blood, dilution pipette (also C); hemospast (also D) and rubber hose (also E) for the binding of the patient's finger; F, capsules of tannic and pyrogallic acid, G, water bottle.

laboratory, yet is so compact that it can be carried in the pocket, though durable and sufficiently simple in operation to be used without special training. By use of the method to be described it is possible to detect the presence of carbon monoxide in the blood in three minutes and to determine the exact quantity present within fifteen minutes, and, on the basis of these findings, to administer treatment. The method and apparatus should fill the needs of hospitals, industrial surgeons, safety engineers, coroners, departments of public safety, boards of health and other allied agencies."

The method is based on the fact that a light brownish-gray substance is suspended in the liquid after a few minutes when normal blood is diluted with water and treated with a solution of tannic and pyrogallic acids. In blood having carbon monoxide in combination with all of the hemoglobin the suspension is light carmine. Carrying this a step further it is found that in any mixture of normal blood with blood containing carbon monoxide, the suspension which is formed will be a corresponding mixture of the two extremes of color. Consequently for tests according to the method installed by the Bureau a set of standards, or vitals are provided, variously colored to represent the different colors produced by varying, but known, percentages of carbon monoxide in combination with hemoglobin. By making comparisons, specimens of blood having unknown percentages of carbon monoxide can be matched with these standards and the degree of poisoning accurately appraised by mathematical formula.

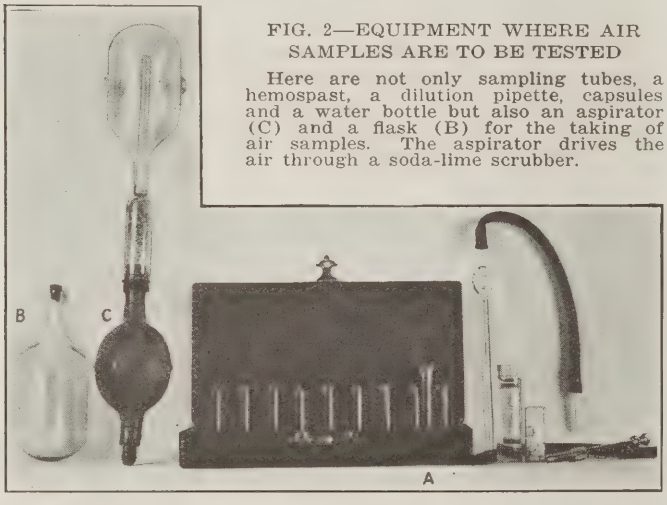

FIG. 2—EQUIPMENT WHERE AIR SAMPLES ARE TO BE TESTED

Here are not only sampling tubes, a hemospast, a dilution pipette, capsules and a water bottle but also an aspirator (C) and a flask (B) for the taking of air samples. The aspirator drives the air through a soda-lime scrubber.

"The former technique of making a determination was to prepare standards from blood, but these were not permanent, and the frequent necessity for making them was undesirable," says the statement. "To overcome this, standards have been developed and prepared from pigments, which have been found to be satisfactory for routing analysis. When not in use these standards should be protected from light. The former procedure also involved the use of chemical solutions which deteriorated on standing, and it was necessary to have them freshly prepared. This objection has been eliminated by preparing the chemicals in solid form. These changes, together with the adoption of a solution pipette, have lessened the number of operations and pieces of apparatus required for a determination. The apparatus at all times is ready for use."

The complete outfit is shown in Fig. 1, and consists of the following:

(a) Set of permanent standards made to match the color of blood having varying quantities of CO.HB (0, 10, 20, 30, etc., per cent), arranged in a rack with spaces between for interposing tubes of similar size containing specimens of blood for analysis. (b) Small test tubes (of the same size and glass as those used for standards) for preparing the specimens of blood. (c) A dilution pipette for measuring blood. The long capillary stem is calibrated with a 0.10 c.c. mark, and the total pipette has a volume of 2.0 c.c. This allows the dilution of 0.10 c.c. sample of blood with water to 2.0 c.c., or a ratio of 1 in 20. (d) A spring hemospast for making small puncture wounds from which blood is obtained. (e) Rubber hose for wrapping the subject's finger during the taking of the blood sample. (f) Tannic-pyrogallic-acid mixture (0.04 gram of a 1:1 mixture) for reducing the colored suspension in the diluted specimen of blood. (g) Small bottle of water for diluting the blood.

All of the above apparatus is arranged in a compact pocket case 3 x 7 x 1¼ in.

The procedure is as follows: A small puncture wound (approximately 2 mm. deep) is made with a needle or hemospast in the tip of the finger or other convenient part of the body of the supposed victim of carbon-monoxide poisoning. If the blood does not flow freely the finger may be wrapped with the rubber hose, beginning at the base and progressing toward the tip. Massaging the finger also aids the flow. If death has occurred it may be difficult to obtain liquid blood, but this can be done during the process of embalming. When the blood has been procured it is quickly drawn into the stem of the pipette to the 0.1 c.c. mark.

The pipette is then held in a horizontal position, and any blood on the exterior of the tip is removed. The tip is slightly raised to allow a little of the blood to flow into the diluting bulb, and, by inserting it quickly into the bottle of water, and using suction at the same time, it can be filled to the 2-c.c. mark to give the proper dilution. The blood solution is then discharged into one of the test tubes, a little of the solution being drawn back once or twice into the pipette to wash out any adhering concentrated blood.

The entire procedure of obtaining the blood specimen should be as rapid as possible to eliminate possible clotting. In case it is desired to take more than one sample the pipette can be rinsed out by using a little of the dilution water, being careful to blow the capillary stem free of water before taking the next sample.

Immediately after the blood solution has been discharged into the test tube, the contents of a capsule of the tannic and pyrogallic acid are added, and the tube is inverted three or four times to insure thorough mixing of the reagents. It is then placed in the rack and allowed to stand fifteen minutes at room temperature. It is then compared with the standards by interposing it between them and finding the standard which it most nearly matches in color, and then estimating the percentage of carbon monoxide-hemoglobin from the value of that standard. The value of the standards give directly the quantity of carbon monoxide in the unknown specimen of blood. If carbon monoxide is indicated, the tube should be allowed to stand fifteen minutes longer, taking the latter reading as being the more accurate. Observations may be taken after several hours without serious loss of accuracy, although this is not advisable except in case of necessity.

For determining the presence of carbon monoxide in

the air, some additional apparatus is provided, to be used in connection with the set of standards. The outfit includes, as illustrated in Fig. 2, the following: (a) Complete set of standards, as shown in Fig. 1; (b) air-sample bottles of at least 250-c.c. capacity, fitted with rubber stoppers; (c) rubber aspirator bulb with attached "scrubber" (a tube of soda-lime) for removing gases which might have an interfering effect.

In applying this test a sample of air is obtained by inserting the glass tube, on the end of the scrubber, into the sample bottle, as shown in Fig. 2, and then aspirating the air through the sample bottle long enough to purge it of its original contents—at least twenty-five squeezes of the bulb.

The blood to be used in making the analysis should be taken from a person who has not been exposed to carbon monoxide. The 0.10 c.c. of blood is diluted to 2 c.c. All of the 2 c.c. blood solution is discharged immediately from the pipette into the sample bottle.

The atmosphere thus introduced should be brought into equilibrium in a dimly lighted place. After replacing the stopper, the bottle is held horizontally and rotated constantly for fifteen to twenty minutes, violent shaking and agitation being avoided. As much as possible of the surface of the bottle should be covered with the blood solution. Every now and then the solution can be centrifugally thrown from the sides to the bottom of the bottle by a quick swinging motion, which allows a new surface to be formed and aids in reaching equilibrium.

When the equilibrium has been finished, the solution is poured into a test-tube, the tannic-pyrogallic acid added, and the determination of carbon monoxide-hemoglobin made according to the procedure already described.

To test the accuracy of the method, synthetic carbon monoxide-air mixtures varying from 0.01 to 0.15 per cent were carefully made by volume, and 150 c.c. samples were taken for blood analysis, and some of the higher percentages for combustion analysis by the Haldane method. The blood analyses were run in triplicate, using blood from a different subject for each. Observations as to the amount of carbon monoxide-hemoglobin were made by three men—one experienced, and two inexperienced—the latter having no knowledge of the origin of the sample. Since this test for accuracy was made the method has been used continuously as a check

FIG. 3—MATCHING SAMPLE WITH SCALE OF COLORS

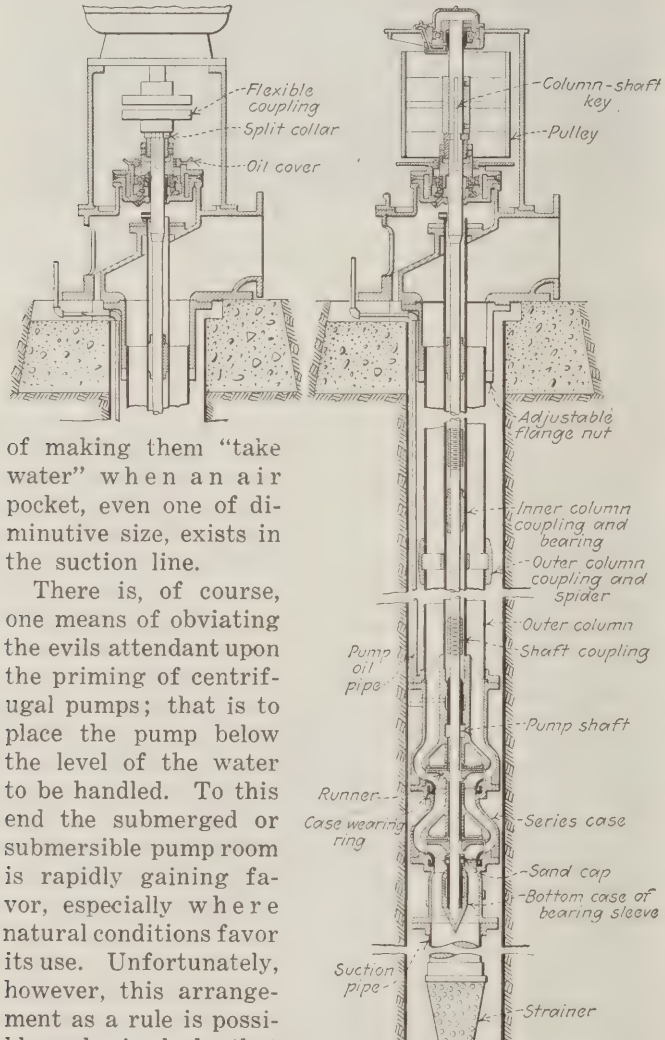
An experienced man can readily place the sample where it belongs and so ascertain the approximate percentage of carbon monoxide in the blood being tested.

FIG. 4—EXTRACTING BLOOD WITH THE HEMOSPAST

Blood is taken from normal men for use when a test is to be made to find the percentage of carbon monoxide in the air. It will be noted that a rubber tube is entwined around the subject's finger so as to put the blood under pressure and cause it to pass more readily into the hemospast.

on the carbon monoxide found by analysis of mine and tunnel atmospheres and the products of combustion from gas stoves, by the Haldane combustion apparatus, and in all cases the results have been satisfactory.

When no carbon monoxide was present out of mine observations, on three samples, only one reported it as present, and then only 0.005 per cent. The greatest error reported was 0.005 per cent, with 0.01 per cent carbon monoxide in the gas, excepting one observer who reported 0.00 carbon monoxide for one of the samples. As the percentage of carbon monoxide increased, the error also increased, as would be expected from the nature of the dissociation curve; but in all events the results obtained are within the limits of error allowable from the standpoint of the purpose for which the method was devised.



To sum up the matter: (1) A durable and compact laboratory or field apparatus for the quantitative determination of carbon monoxide in blood and air has been described. On account of the compactness, durability, and the ease with which accurate and dependable results can be obtained, it should be of great use in investigations pertaining to the cause, diagnosis and treatment of carbon-monoxide poisoning. (2) the percentage saturation of carbon monoxide in blood can easily be determined to an accuracy of 5 per cent. (3) The accuracy of the method for determination of carbon monoxide in air, even when used by inexperienced men, was found to be 0.005 per cent in regions of 0.000 to 0.05 per cent carbon monoxide; 0.01 per cent in regions of 0.05 to 0.08; 0.02 per cent in regions of 0.08 to 0.12, and 0.03 per cent in regions 0.12 to 0.18 per cent carbon monoxide.

COAL-PREPARATION STUDIES.—Thomas Fraser, assistant mining engineer, and H. F. Yancey, assistant chemist, attached to the Central District experiment station of the U. S. Bureau of Mines, Urbana, Ill., have completed a series of experiments on the cleaning of central Illinois coal screenings. A report on the subject has been prepared. Messrs. Yancey and Fraser have determined the forms of sulphur in the products obtained in washing tests on central Illinois screenings. The results show this coal to be high in finely disseminated pyritic sulphur as well as in organic sulphur. Work has been undertaken on samples of coal from Wyoming to determine whether it is amenable to improvement by the dry table cleaning process.

Deepwell Pumps Adapted to Mine Drainage; Submergence a Favorable Condition

OF THE many problems connected with mine drainage that of priming the pumps unquestionably is one of the most troublesome. This is particularly true of centrifugal machines. Priming a pump, as a rule, is not a difficult or expensive operation. It is, however, a vexatious one. Furthermore, everyone that has had experience with pumps of this kind knows the difficulty of making them "take water" when an air pocket, even one of diminutive size, exists in the suction line.

There is, of course, one means of obviating the evils attendant upon the priming of centrifugal pumps; that is to place the pump below the level of the water to be handled. To this end the submerged or submersible pump room is rapidly gaining favor, especially where natural conditions favor its use. Unfortunately, however, this arrangement as a rule is possible only in beds that pitch more or less steeply, such as those of the anthracite region and the mountain states of the West.

DEEPWELL PUMP

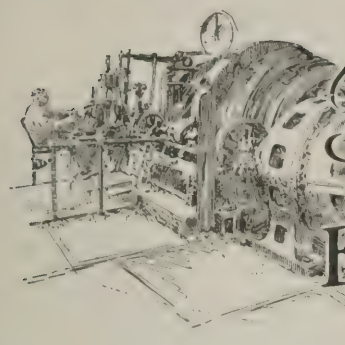
This pump relies on the principle of submergence, the water standing in the impellers when the pump is not running.

A type of pump that has been used to an appreciable extent in other industries and which overcomes the difficulty of priming has more recently found a place in the coal mines. This is known as the Byron Jackson deep-well turbine pump, made by the Byron Jackson Iron Works, of San Francisco, Calif. This pump is of the vertical-shaft type and is driven either by belt or direct by vertical motor. This arrangement allows almost any distance to intervene between the motor or pulley and the pump.

As a result the machine may be installed in a shaft with the pump submerged within the sump and the driving motor well above high water; or the pump may be placed in a borehole and the motor installed on the surface. Again the pump may be placed in a sump in one bed while the motor may be installed in a bed above, the shaft extending downward either through a borehole, a winze or an upraise.

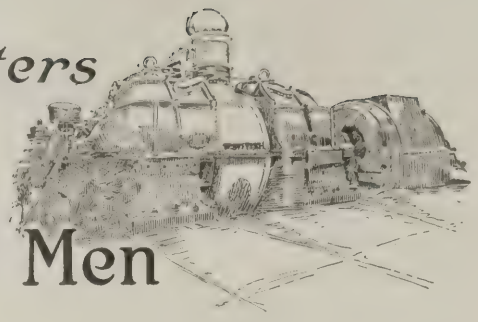
Any one of the arrangements outlined possesses certain obvious advantages. Not only is the pump always submerged so that it is certain to take water immediately upon starting but the motor always is high and dry, where it will never be in danger of being flooded. In case the motor is placed on the surface and the water is discharged through a borehole the motor is in such a position that it can be cared for in a proper manner and be given the same kind of attention that is bestowed upon the rest of the surface equipment. Furthermore, when this arrangement is adopted the motor is not subjected to the dampness of the mine atmosphere.

Choosing a Permissible That Will Produce A Large Percentage of Lump Coal*



BY CHARLES S. HURTER

EXPLOSIVES users tend to inquire first as to the relative quickness of an explosive when they wish to break up material into large pieces, for they fear that an explosive that has a high rate of detonation will shatter that material, but it has long been known in rock work that the size of the product is governed by the strength per cartridge quite as much as by the quickness of the explosion. In tight work some dense, comparatively slow explosives have produced as large material as lighter and quicker explosives, because the charge, being held in, is enabled to gain its full strength before the material to be blasted gives way. Consequently its deficiency in quickness does not act to its disadvantage. On the other hand, a light, quick explosive has produced coarse-sized material when, by reason of its being relatively light, it is distributed over a greater length of hole. Hence there is not the explosive strength per foot of charge to give the smashing effect.



These principles apply also to blasting coal. Therefore in studying the Bureau of Mines list of permissibles to choose an explosive for producing lump coal, not only "Velocity of Detonation" but also the "Unit of Deflective Charge" (strength) and the "Weight of a 1¼x8-in. Cartridge" should be considered. The unit of deflective charge is the weight of explosive, in grams, equal in strength to ½ lb. (227g.) of 40-per cent straight nitroglycerin dynamite. This will make up into a cartridge about 1¼x8 in. Thus, the lower the figure in this column, the greater the strength of the explosive. With a given unit of deflective charge the lighter the cartridge, the less its strength and the more cartridges per case.

Even though an explosive has a low unit of deflective charge—that is great power per unit weight—and a high velocity of detonation, it will produce good lump coal if the weight of a 1¼x8-in. cartridge is low. This has been shown conclusively by the results obtained with the newer types of ammonium-nitrate explosives having a large number of cartridges per case. The cartridge or bulk strength of an explosive is of great importance in the production of lump coal from thin beds where the coal is undercut. When the strength and density are about the same, then the explosive having the lower velocity will probably produce the larger percentage of lump coal.

Practical Pointers for Electrical and Mechanical Men

Economy in Controller Maintenance; Repairs to Fingers

WITH production costs at the present high level, maintenance charges have to be kept at a minimum, and any suggestions with this object in view deserve consideration. Controllers for regulating the speed of motors in mines have to withstand exceptional usage. In addition to ordinary fair wear and tear, electrical apparatus generally is exposed to careless treatment, which in the case of controllers often leads to serious burning of contact fingers and drum segments. This involves frequent repairs and renewals. Makers usually are prepared to supply spare fingers and contacts, but much of this expense can be saved by making the spares at the mine and where necessary altering contact fingers so that repairs are facilitated and efficient operation maintained at a low cost. The upper portion of the figure shows a typical contact finger fitted to large numbers of controllers.

STANDARD FINGER AND ADAPTED FINGER

Burning tips attached to the standard finger cut down the maintenance cost of controllers. Contact blocks may readily be renewed or the finger adjusted.

It is obvious that when the contact portion becomes badly burned, the whole finger has to be scrapped. Moreover, during service the finger either must be filed in position or it must be entirely removed for the purpose. The first method is objectionable because of the filings getting into the oil in oil-immersed controllers, and causing short-circuits. Further, it is very difficult to file away the burnt surface with the finger in position. Taking out the finger often involves the removal of two small screws, which usually are difficult to replace because of the spring in that portion of the finger which supplies the tension when it is screwed home. Both time and money can be saved by fitting the fingers with contact blocks as shown in the lower part of the figure. Fingers that are not too badly worn can easily be altered and spares might be fitted with blocks ready for inserting in the controller when required.

The method of fixing the contact blocks is clearly shown in the figure, which is almost self-explanatory. The contact finger to be altered should be heated and the end flattened. Then it should be filed to form a step toward the heel against which the contact block rests when held in position by its screw. This prevents the block turning in the event of the screw becoming loose. The blocks can be cut from square copper bar which in lengths of, say, 1 ft. or 12 in. have been shaped in the machine shop. The bars should be marked off, drilled and tapped before being cut into blocks. Afterward they should be fitted to a standard finger so that they will be interchangeable. The fingers too should be made to a standard, for the same reason.

To allow for adjustment each finger should be provided with a set screw and a locknut, so that as the blocks wear, the fingers may be lowered to keep the contact portion of all blocks in perfect alignment. The block should be held in position by cheese-head screws, and if found desirable they may be fitted with locknuts. The advantage of these interchangeable blocks is that each controller can be provided with a spare set to replace those taken out for repairs. The block can be changed quickly, those taken out being filed up in spare time ready for replacing when further repairs are necessary. For controllers doing heavy service, allowing only short periods when repairs can be done, these block contacts are very convenient. R. F.—E.

A Simple Explanation of Dynamic Braking And Dynamic Lowering

RECENT developments in controllers for small hoists and mine locomotives have proved that dynamic braking and dynamic lowering are both economical and very practical. Economical because the wear and tear of brake shoes and brake rigging especially on mine locomotives is reduced to almost nothing. Practical because controllers are now designed which can be installed with very little extra cost and operated with very little extra maintenance and the number of repair parts hardly more than were required with the old type of controller.

Dynamic braking and dynamic lowering are not on and the same thing although both are mistaken one for the other. Dynamic braking, which is a system of braking whereby the load is actually retarded, is obtained by shunting a resistance around the armature and series field, making in fact a series generator, as shown in Fig. 1.

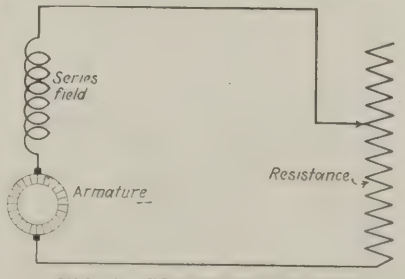

FIG. 1—CONNECTIONS FOR DYNAMIC BRAKING

With this arrangement of the circuit the series motor is used as a series generator, thus creating a counter torque to that of the descending weight. The series generator is loaded by means of the usual control resistance, which may be varied by the controller. When the armature stops, the counter torque of the generator is zero; therefore it is necessary to apply a mechanical brake to hold the descending weight at rest.

This connection will retard the load —i.e., slow up the

speed to a point where the current generated in the armature exerts a torque that is just sufficient to balance the load. This speed at which the load will be held constant is a function of the grade and the weight. Any increase in speed now would increase the current, which in turn would increase the torque, thus exerting a greater retarding effort. Any decrease in speed would decrease the current generated in the armature and consequently decrease the torque, exerting a smaller braking effort.

The foregoing is for any given value of resistance inserted in series with the armature. As mentioned in the preceding paragraph, for any particular grade and weight and with a particular value of resistance inserted in series with the armature there is a definite speed at which the load will move. With these same conditions of weight and grade the speed can be varied by increasing or decreasing the amount of resistance. Controllers are designed to do this and the maximum braking will occur when the armature is short-circuited through the series field and the minimum amount of braking will occur when the maximum resistance is placed in the circuit—that is, on open circuit. One thing must be noted and that is that when the armature stops revolving the braking effort is entirely lost. It is evident then that to bring the load to a standstill the mechanical brakes must be applied.

Dynamic lowering is a term applied to a system of retardation or the holding of the load at any given speed desired regardless of the conditions of grade or size of load. This is accomplished by making a shunt generator out of the motor and connecting it across the line. It will be well to note here that dynamic braking is applied on locomotives mostly, while dynamic lowering or a combination of the two is used on hoists. An understanding of dynamic lowering can be obtained from Fig. 2, which is a schematic diagram of a hoist controller which in the off position of the controller handle gives a dynamic braking connection and in other positions of the lowering position dynamic lowering. Fig. 3 is the actual connection diagram of the controller.

Referring to Fig. 2, in lowering, starting from rest the load will speed up as soon as the mechanical brakes are released and will be held automatically constant at some definite speed. Moving the controller handle now

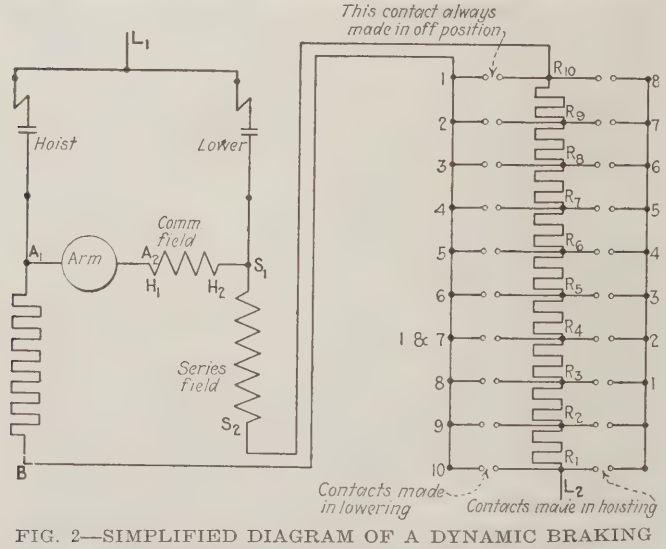

FIG. 2—SIMPLIFIED DIAGRAM OF A DYNAMIC BRAKING AND DYNAMIC LOWERING CONTROLLER

Most hoist controllers are arranged to give dynamic braking for making a stop and dynamic lowering for regulating the speed of the descending weight.

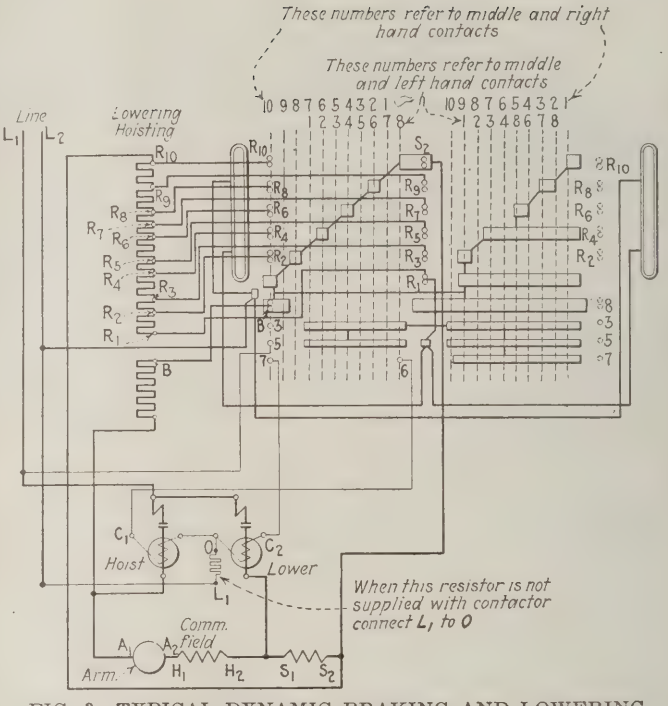

FIG. 3—TYPICAL DYNAMIC BRAKING AND LOWERING CONTROLLER

These controllers give ideal control of the load and aside from making the operation easier, permit safer handling and subject the equipment to less mechanical shocks and jars.

to the first notch, lowering, closes the main-line contactor and closes contact fingers 1 and 7 in the controller. This makes a shunt generator connected across the line. A condition of maximum current is now attained in the field. The second notch on the controller in lowering closes contact finger 2 in the controller, which weakens the field, allowing the load to speed up. Then closing successively fingers 3 and 4, etc., the motor speeds up until maximum speed is reached and contact finger 10 within the controller is closed. To retard the load the controller is swung to the off position, which, as before mentioned, makes a series generator short-circuited through a resistance. The motor slows down and finally the mechanical brakes are applied to bring the load to rest. Analysis of the diagrams will show that the wiring installation is no more complicated than with other types of controllers.

O. E. KENWORTHY.

Wilkes-Barre, Pa.

Useful Table for Construction Work

THE more general housing of electrical equipment in concrete or otherwise fireproof buildings frequently requires the drilling of holes for attaching equipment. I therefore wish to submit for publication the following table showing the dimension of drills to be used with expansion bolts which will no doubt prove valuable:

Diameter of Bolt	Diameter of Drill	Diameter of Bolt	Diameter of Drill
¼ in.	½ in.	⅞ in.	1 in.
5/16 in.	5/8 in.	1 in.	1⅛ in.
⅜ in.	⅝ in.	1⅛ in.	1¼ in.
½ in.	¾ in.	1¼ in.	1⅜ in.

A. J. KELLEY,
Construction Foreman.

UNFORTUNATELY, AN INTELLIGENT MINORITY doesn't always stay that way after it becomes a majority.—*Chicago Journal.*

Will Pulverized Coal Be Substituted for Fuel Oil in Smelting Operations?*

Freight Rates and Number of Heat Units Big Factors in Comparing Fuels—Pulverized Coal Has Higher Thermal Efficiency Than Mine-Run—Cheap Electrical Power from Water-Power Developments May Compete with Fuel Oil and Coal

By T. H. O'Brien
General Manager Inspiration Consolidated Copper Co.

CONSIDERATION frequently has been made of late by a large number of copper smelters of the advisability of replacing fuel oil with pulverized coal as a heat-producing medium for smelting operations. This matter has been, and is more so now than at any time heretofore, of great importance. Due to the intensive development of oil-producing areas of the world and the tremendous use of fuel oil for many purposes it seems that before many years the supply of oil will become so small as to prohibit its use for such operations as smelting. This may be caused by prohibitive prices, or even by government regulations as a conservation measure.

In the event that the use of fuel oil becomes out of the question, the copper companies have just two alternatives: the use of pulverized coal or electricity.

There is no doubt whatever that the consumption of copper is going to increase, perhaps for the next ten years. This means that more copper mines will be developed, and the mines that are now producing will be called upon for a greater production. This all tends to show that the mine manager who is looking ahead must develop some substitute for fuel oil in the event of its use becoming prohibitive, and all indications seem to point in that direction.

The only coal which is commercially available to the smelters in the Southwest must come from Colorado and New Mexico. These coals are high in ash and volatile matter and comparatively low in calorific value.

Distance from Mines an Economic Factor

The proximity of the smelter to the coal mines is a large factor in determining which fuel is more economical. Most of the smelters within two or three hundred miles of the coal mines find it more profitable to burn coal, while those at greater distance find that the higher freight charges on coal make the use of oil more economical.

The use of pulverized coal entails a much greater initial expense than does the use of oil. A small pulverizing plant is far from economical. There have been a number of small individual units put on the market in the last few years, but they have not been very successful either in the product which they have delivered or from the standpoint of operating expenses. This fact nearly prohibits the small operator from using coal.

The freight rate on oil usually is less than on coal, also the tank cars are owned by the oil companies, and it is up to them to provide cars in sufficient number to handle their output, while in the shipment of coal one is dependent on the railroads for cars.

Heavy construction expense would be necessary in changing the equipment of boiler plants from their present oil-burning system to a coal-burning system. In case the coal was not pulverized, overhead bins and mechanical stokers would be necessary. Also, the available coals would not burn with a high efficiency over grates. The consumption of coal by reverberatory furnaces is 50 per cent greater than by boilers in the Southwest, and to obtain a reasonable efficiency the coal must be pulverized for furnace work.

In a large reverberatory plant the cost of preparation of the coal should not be over 75c. per ton. This would include such items as local switching, weighing, unloading, crushing to slack size, drying, pulverizing, conveying, feeding, etc. Local conditions might vary some of the above items materially. In some cases, drying might not be necessary and in others it might cause an excessive expense. Also ash removal in some plants might be very expensive, especially if the plant were not built for powdered-coal burning.

Expensive Aspects of Coal as Fuel

Due to the uncertainties caused by possible labor and railroad strikes, it would be imperative for the copper companies to carry large stocks of coal, with the consequent heavy interest charges and constant danger of fire and deterioration.

Grinding and drying costs on coals high in ash and moisture are high. The freight charges on noncombustible materials would be a considerable item on these coals. Thermal efficiency on high-ash coals is greatly increased by pulverizing.

After a coal is satisfactorily pulverized and delivered to the burner, the regulation of the heat is as easy with coal as with oil. Coal in a powdered form is about as combustible as gasoline, and constant care must be used in its storage. A coal-pulverizing plant must always be kept scrupulously clean and dust in the atmosphere kept at a minimum. Even with the greatest precaution, there always is constant danger of disastrous explosions.

The cost of local switching, measuring, pumping, heating, atomizing and maintenance of fuel-oil equipment will range from 10c. to 20c. per barrel of oil, with an average of about 13c. in a large, well-managed plant.

Therefore, coal containing 10,000 B.t.u. per pound and selling at $2 per ton at the mine, with a preparation cost of 75c. per ton, will stand a freight charge of not to exceed $3.80 per ton, in order to compete with oil at $1.87 f.o.b. cars at point of consumption. Coal containing 12,000 B.t.u. per pound would carry a transportation charge of $4.55 per ton.

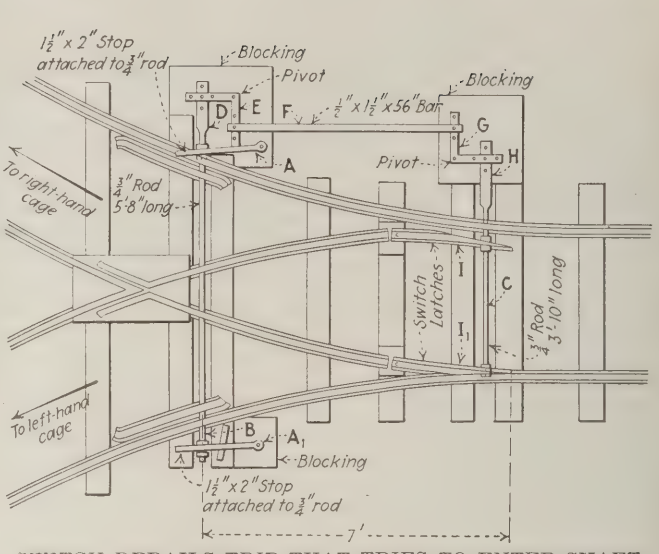
With oil costing $3 per barrel burned, or $2.87 f.o.b. cars at point of delivery, 10,000 and 12,000 B.t.u. coals would have an even break at a cost in the furnace of $9.70 and $11.65 per ton respectively. With prepara-

*Paper read before Rocky Mountain Coal Mining Institute.

tion costs of $1 and a freight charge of $5 per ton, the price at the mine should not exceed $3.70 and $5.65 per ton respectively. The above costs do not include capital charges, taxes, etc.

In a new installation the cost of storage and handling equipment for coal would to some extent be matched by that necessary for oil, but in the event of changing the present equipment from oil to coal, the coal would of necessity be required to carry the capital charges in excess of the operating costs. Recent estimates give the cost of a coal-preparation plant of 500 tons daily capacity at about $500,000. Assuming a ten-year useful life, the capital charge would amount to about 50c. per ton of coal.

It is quite probable that within the next ten years cheap electrical power will be available from the development of the Colorado River. Electrical smelting is not very far advanced in this country, but in some foreign countries, notably Sweden, it is used to a considerable extent. It is not inconceivable that by the time fuel oil becomes unavailable, cheap power and advanced methods will make electricity an active competitor of coal for smelting purposes.



At the present prices of oil and coal delivered at any considerable distance from the mines, and the necessary cost of new construction for the use of coal, oil has a distinct economical advantage. Assuming that the cost of fuel oil increases to the point where the mining and metallurgical industries would discard it in favor of pulverized coal, the plants in the Southwest would require about 3,000 tons per day.

A Latch Which Passing Cars Reverse

AT THE foot of the Twin Shaft, Seneca Colliery, in the Marcy bed, is a switch operated by an ingenious device which by passing mine cars is manipulated in such a way that the cars are fed first to one shaft cage and then to another, the changes in the switch to that end being made entirely automatic. The mechanism was designed by D. J. Matthews, the inside foreman of the mine, the material from which it was made being gathered around the colliery and made up in the company's own shop. The device is described in a recent issue of the *Employees' Magazine*, published by the Lehigh Valley Coal Co.

When a trip of cars comes down the roadway the bottom cager, or "footman," sets the switch to guide the first car to either the right- or the left-hand side of the shaft, depending on which cage is at the landing. Let us suppose that the first car goes to the right-hand cage as denominated in the illustration. On its way the front wheels will strike the rail-riding latch, *A*, and force it off the rail. This will move the iron bar, *B*, toward the top of the page and pull the companion rail-riding latch, A_1, onto the rail. *D*, which is the flattened end of the bar, will move in the same direction and communicate that movement to the right-angle or bell crank, *E*, which accordingly will pull the rod, *F*, toward the mine shaft, thus tipping the bell crank, *G*, and moving the rod, *C*, through its flattened end, *H*, toward the top of the page. This closes the switch latch, *I*, and opens the switch latch, I_1, so that the next loaded car will go to the left-hand cage.

When another loaded car enters the switch and passes to the left-hand cage the front wheels push back the rail-riding latch, A_1, into the position shown in the drawing, and that shifts all the parts back into the first position, thus throwing the switch into place for the reception of a loaded car soon to be needed at the right-hand cage.

SWITCH DERAILS TRIP THAT TRIES TO ENTER SHAFT

When a trip of cars runs away on a heavy grade near the shaft bottom the automatic switch gets into action. Throwing the cars right and left it soon causes a derailment, preventing them from falling down into the sump.

From the description of the operation of the device, it would seem that its purpose was to expedite the work of the footman. Though in a sense this is true, yet it was not the sole purpose Mr. Matthews had in mind when he installed the device. In fact, his prime reason was the safety afforded by its manner of operation. At that point in the Marcy bed a sharp pitch and curve leads down to the cages. There are times when the coupled trip is so heavy, consisting as it often does of as many as thirty-five loaded cars, that the car runner is unable to sprag the trip, the result being that it runs through the open side of the switch and plunges down the shaft. This was what frequently happened before the installation of the automatic rail-riding latch. While it is true that there is a safety block designed and installed to prevent such an occurrence, still the weight of, and the force expended by, these loaded cars when they strike the block is so great that the "stop" is practically useless in that it fails to prevent the cars from plunging into the shaft and doing much damage to themselves and other equipment. There are, of course, many other secondary losses attendant on such accidents.

With the device in operation, should a long trip of coupled cars get away from the spragger upon approaching the shaft, the first car will pass over the switch and throw it in the opposite direction. The second car then travels in a different direction from the first and in doing so throws the switch so that the third car attempts to take the same direction as the first car. As a natural result the trip is derailed, throwing the cars against the rib to the right and left, but preventing them from plunging down the shaft. The feasibility of this device has been tested on several occasions when a loaded trip of cars got away from the runner and in each instance the cars were prevented from getting anywhere near the shaft.

J. C. BRYDON, CHAIRMAN OF THE BITUMINOUS OPERATORS' SPECIAL COMMITTEE, on June 7 announced the appointment of E. L. Douglass, vice-president of the First Creek Mining Co., Cincinnati, Ohio, as a member of the Special Committee in the place of E. C. Mahan, president of the Southern Coal & Coke Co., Knoxville, Tenn., who resigned because of a serious accident which befell him recently.

Book Reviews

Machinery Foundations and Erection

Another book of the Power Plant Series, just published by the McGraw-Hill Book Co., 370 Seventh Ave., New York, N. Y., is of special interest to electrical and mechanical men in the coal fields, rapid expansion and change in machinery used around mining properties having created a demand for a text dealing with foundations and installation of equipment. The new volume is "Machinery Foundations and Erection," by Terrell Croft.

The material in the book is a compilation of practical and theoretical ideas that have proved successful. Considerable of the text has been obtained from a wide range of technical and practical engineering journals devoted to all the important industries of the country. Conspicuous among these are extracts from *Coal Age, Electrical World, Power* and *American Machinist.*

The subject matter covers the whole field of foundations from anchor bolts, through excavating and masonry to erection of machinery.

Powdered Coal—Its Preparation, Transportation and Combustion

MANUFACTURERS and operators of coal-fired furnaces will find facts which they cannot afford to disregard pointed out in Bulletin 217, U. S. Bureau of Mines, by John Blizard, a paper giving an account of the methods, advantages and disadvantages of preparing and burning powdered coal. They will do well if careful estimates are made comparing their present method of burning coal on grates with a system for pulverizing and burning it.

Several systems successfully used are explained in the bulletin. There also is a generous description of various types of pulverizers and furnaces, together with test data on typical installations using all kinds of fuel from lignite to anthracite.

Powdered coal has proved an economical fuel for steam raising, cement making, metallurgical furnaces and many other purposes. For steam raising, with a properly constructed boiler and furnace, a continuous efficiency of over 80 per cent may be maintained.

A Ready Reference in Material Handling

AN EXHAUSTIVE compilation of definitions, descriptions, illustrations and methods of the use of material handling machines employed in our industries is contained in a book entitled "Material-Handling Cyclopedia," recently published by the Simmons-Boardman Publishing Co. It is divided into three sections; the definition section, illustrated section, and catalog section.

In the definition section are defined devices, accessories and terms used in material-handling machines which may be broadly classified as hoisting equipment and transportation equipment.

The illustrated section shows typical and special applications of various kinds of material-handling machines in a large group of industrial enterprises.

The catalog section gives specific information regarding the products and services of a large number of the leading manufacturers of such equipment.

As a book it is truly a cyclopedia for ready reference on any problem of material handling and no doubt will find a prominent place in the files of the managers and engineers of the industries.

Index to Proceedings of American Society For Testing Materials

THIS is a subject and author index of papers and discussions before the American Society for Testing Materials, of 1315 Spruce Street, Philadelphia, Pa.

The arrangement of the material gives ready access to such topics as belting, bearings, corrosion, wood preservatives, etc.; all of which are of vital interest to engineers and purchasing agents in the coal fields.

The subject matter of the articles referred to in the text is rapidly becoming authoritative and more generally used, thus creating a heavy demand for copies of the index.

Explosives and Equipment in Coal Mines

TECHNICAL Paper 333 of the U. S. Bureau of Mines has just been issued. It contains a table giving the brand names of all explosives now considered as permissible for use in dusty and gaseous coal mines, tested by the Bureau of Mines prior to Jan. 1, 1923. The list includes a total of 154 permissible explosives. In addition Technical Paper 333 includes lists of permissible explosion-proof coal-drilling and shortwall-mining equipment, permissible electric lamps, permissible flame safety lamps, permissible methane indicators, single-shot blasting units, storage-battery locomotives, mine-rescue breathing apparatus, and gas masks. Co-operation of the operator in maintaining the various lines of apparatus listed in a safe condition is earnestly solicited.

DESIGN OF FURNACES FOR BURNING POWDERED COAL.—Furnaces in which powdered coal is to burn must be large enough, and be correctly shaped, so that the coal may burn completely without impinging on the brickwork, and must be provided with facilities for removing the ash, states the Department of the Interior in Bulletin 217, just published by the Bureau of Mines. If the furnace is correctly designed, about 3 B.t.u. per second may be liberated per cubic foot of combustion space. This rate of combustion is sometimes exceeded, but if it is much exceeded the coal will not be burned completely. In many furnaces the temperature is so high that the ash fuses, and on settling in the furnace collects in a continuous mass. It has become expedient in some furnaces to cook the ash before settling and so prevent it collecting in a continuous mass, though generally this is not done, and the ash collects either on the hearth, whence it is removed when the furnace shuts down, or it is removed as a liquid slag. The ash that does not settle in the furnace goes off with the gases, and care must be taken to see that it may not be deposited in the flues and so impede the draft. When a furnace previously heated by coal burned on a grate, gas, or oil is to be transformed into a powdered-coal fired furnace, the furnace may or may not have to be modified in design to suit powdered coal. Except for boiler furnaces, very radical alteration of design is unusual. At most, the change consists usually in enlarging the furnace. But no furnace should be fired with powdered coal without the advice of experienced engineers, who will either approve the application of powdered coal to the furnace as it exists or carefully redesign it so that it may be economically operated with powdered coal, using the best means of disposing of the ash.

Problems of Operating Men

Edited by James T. Beard

Use of Water Gage in Estimating Power on the Air

Correct Position of Water Gage to Indicate Total Energy of Air Current—Sum of Velocity and Static Heads Determines the Power on the Air

READING the interesting article entitled "Developments in the Theory of Centrifugal Fans," by Henry Briggs, professor of mining, Heriot-Watt College, Edinburgh, Scotland, which appeared in *Coal Age*, April 12, p. 601, I fail to understand how the position of the water gage shown in Fig. 3 (a), p. 602, is correct, when estimating the power on the air.

In the position shown in that figure the end of the tube connected with the water gage is bent at right angles and turned to face the current. It is evident that the reading of the gage, in that case, will indicate the combined velocity and static heads, instead of showing the static head only, as indicative of the pressure producing the circulation in the airway. As I understand it, this is the principle on which all flow meters are designed, and I would ask, "How can the meters record the flow if the method here shown is correct?"

Cresson, Pa. ELECTRICAL ENGINEER.

The letter of this correspondent was submitted to Professor Briggs, who replied, in substance, as follows:

The meaning of the point raised by the correspondent is not clearly defined, and in attempting to reply I beg to refer to the accompanying sketches, which I hope will make clear the use of the water gage in estimating the power on the air flowing in an airway.

Our friend's difficulty, it seems to me, is that he has failed to comprehend the purpose for which the water-gage reading is taken, in this case. What is desired is to estimate the energy responsible for the flow; or, as we say, the power on the air. This is a different proposition from that involved in a flow meter, which has for its purpose ascertaining only the velocity of the current by measuring the velocity head only.

The principle of the flow meter is clearly shown in Fig. 1, where a water gage is connected with two tubes, *A* and *B*. The end of the tube *A* is bent at right angles and turned to windward, in which position it is exposed to the combined velocity and static pressures concerned in the flow. On the other hand, the end of the tube *B* is arranged normal to the current and is subject to the static pressure only. It is evident that, by this arrangement, the reading of the water gage will indicate the difference in these two pressures and represent the velocity head only from which the velocity of the current is ascertained.

WATER GAGE TO INDICATE ENERGY OF CURRENT

Now, in dealing with the subject of mine ventilation and the theory of centrifugal fans, discussed in my article to which reference has been made, it is necessary to obtain a water-gage reading that will represent the energy of the current, as determined by the product of the velocity and pressure.

To make the situation more clear, allow me to refer to Fig. 2, which represents an airway of varying cross-section. As indicated by the arrows, the ventilation is from left to right, and I have assumed an average sectional area of the airway at the extreme left; a contracted area at the center, and an expanded sectional area at the extreme right of the figure. Now, ignoring, as we may, the frictional resistance between these nearby points, it is clear that the power on the air, or the energy of the current, is the same at each of these stations.

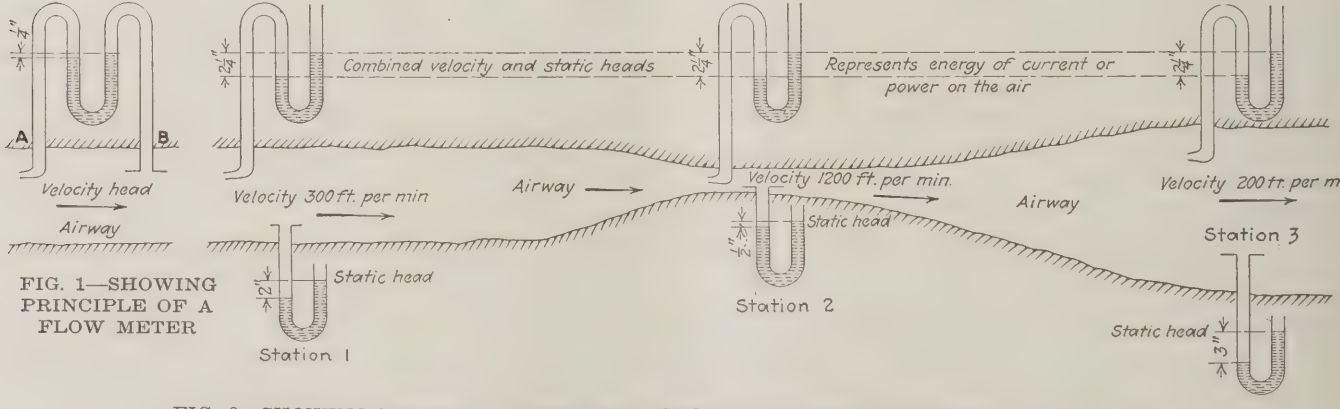


FIG. 1—SHOWING PRINCIPLE OF A FLOW METER

FIG. 2—SHOWING EFFECT OF CHANGE IN SECTIONAL AREA ON WATER-GAGE READING

On the other hand, for a constant power, as the velocity is increased at Station 2, by reason of the contracted area at that point, the static pressure is correspondingly decreased. Again, at Station 3, where the area is much enlarged, the velocity falls and the static pressure is correspondingly increased.

The three water gages shown above the airway, having the ends of the tubes bent to windward in each case,

give a constant reading, regardless of the sectional area of the airway, as indicated by the dotted lines showing the height of the several water gages. On the other hand, the three gages shown below the airway each give a reading that varies with the sectional area of the airway at the point where the reading is taken. These results can be verified by actual trial. In each case, the difference between the upper and the lower reading, at each station, gives the velocity head for that station. In the figures introduced this velocity head is assumed to be ¼ in., while the normal static head is taken as 2 in. The latter falls to ½ in. when the area is contracted and rises to 3 in. where the area is expanded.

In conclusion, let me express the hope that I have made it clear that the correct position of the water gage, for the purpose of ascertaining the power on the air, is as shown in the upper portion of Fig. 2, having the end of the tube facing windward, so that the reading will record both the velocity and the pressure head. Where the end of the tube connected with the water gage is arranged normal to the current, as in the lower portion of the figure, the reading of the gage will indicate the static pressure only. Finally, the difference between these two readings will represent the velocity head, as indicated by the arrangement shown in Fig. 1, which is common to the flow meter.

Edinburgh, Scotland. HENRY BRIGGS.

Coal Brokerage vs. Sales Agencies

Brokerage of coal not economic—Increases cost to consumer—The Broker not a salesman—Eliminate unnecessary transactions to reduce cost to consumer.

PARDON me for referring again to the question of brokerage in the coal industry. My previous article was with the express object of concentrating attention upon a class of business that serves no economic purpose, as I view the matter. Exception has been taken, by M. R. Atkinson, *Coal Age*, March 22, p. 493, to my classing the average coal broker as a parasite on the coal business, although he admits that there is a class who will rightly come under that appellation.

It is clear that the profit derived in the brokerage of coal represents either a reduction in the legitimate profit of the producer, or an increase in the cost of coal to the consumer. Almost without exception, the latter of these two alternatives is the result when the product must pass through the hands of a broker before it reaches the consumer.

Despite the claims urged by Mr. Atkinson in justification of coal brokerage, the simple fact remains that the more complex the nature of the transaction, the higher will be the ultimate cost of the product.

Applying an Old Axiom

By way of analogy, let me make mention of the mathematical axiom; namely, "A straight line is the shortest distance between two points." Nothing can be more simple than the application of this axiom to the transactions involved in the transfer of a commodity from the producer to the consumer. Each additional transaction adds its quota to the final cost of the product.

Now, the only justifiable excuse that can be offered for the existence of an intermediary between the producer and the consumer must be of a nature that an actual economy is effected through such agency. It must be shown that the same economy cannot be realized in a direct transaction that involves the two principal parties only.

In his defense of brokerage, Mr. Atkinson has suggested that the coal broker relieves the operator of the necessity of establishing and maintaining an organization for the sale of his product. This would class the coal broker as a salesman acting, perhaps, in the service of numerous producers.

Sales Agencies a Legitimate Business

Selling through agencies is a legitimate method of business, and there should be no occasion to question the propriety of its application to the marketing of coal through brokers if their activities are confined strictly to transactions of that nature.

It is well known, however, that a large portion of the business of the average coal broker is on a false basis, the broker assuming the position of producer, on a relatively small investment. Acting in this assumed capacity, a large class of brokers purchase and resell products many times in advance of production.

It is my contention that this class of brokers are nothing less than speculators whose business is illegitimate and whose activities are harmful to the coal industry. In other words, they are parasites on that industry.

Another claim made by Mr. Atkinson incidentally, though with much emphasis, is that the coal broker is in a position to assist the operator in financing his payroll and stating that this "is not the least portion of his service." The suggestion naturally implies that the coal broker is more than a salesman—he becomes an investor, a speculator; and the ability to do this presupposes a degree of control of the operator's business, in which the broker becomes a co-partner.

Effect of Market Control by Agents

It is interesting to surmise what such a control of the marketing of coal means to the general public and the individual consumer. Can it be expected that it will involve any tendency to the lowering of the price of coal to the consumer? Can it be claimed that the activities of brokers such as I have described are anything else than harmful? Certainly, the conditions are not those that would result from legitimate sales agencies, Therefore, I claim that the average coal broker is not a salesman.

In closing his letter, Mr. Atkinson says that had I carried out my logic to its rightful conclusion, I would have made the operators retailers of their own coal. Let me say that, with the exception of a domestic mine, the operator sells his coal in carload lots. Therefore, while he may and should sell to such customers as are able to handle coal by the carload, he cannot be classed as a retailer, under the usual accepted meaning of the term.

As a matter of economy, and a stimulant of trade, allow me to repeat that all products should reach the consumer at a minimum cost. It is to be hoped that the present Coal Commission will thoroughly investigate the channels of trade and eliminate all unnecessary transactions and devious methods in the handling and marketing of this necessity of life. If coal brokers create a direct channel by which the coal reaches the ultimate consumer, their business is legitimate and economical; if not, that fact should be positively ascertained and their business set aside.

Washington, D. C. I. C. PARFITT.

Explosion Results from Stoppage of Fan

Fatal mine explosion points to faulty ventilating equipment—Fan stops when electric current fails—Explosion occurs when fan is again started.

ALLOW me to express my deep feeling, after reading the brief account of the deplorable accident, recorded in *Coal Age*, May 10, p. 768, as having occurred in the Southwestern Mine of the Rocky Mountain Fuel Co., at Aguilar, Colo., May 5, causing the death of ten men at work in the mine. Had this not been an idle day the loss of life would have been greater.

The report states that investigation showed the electric current operating the fan had failed and the fan was stopped for fifteen or twenty minutes. It was during this interval, or when the fan was again started, that the explosion occurred. To my mind, this seems a very strange occurrence and points plainly to the fault of the management in failing to provide safe equipment for the ventilation of a gassy mine.

While the account does not state whether this was a gas or a dust explosion, it may be assumed that gas had accumulated, at some point in the workings, while the fan was stopped and that this body of gas was ignited either by the sparking of a live wire or other possible cause. Perhaps a booster fan, inside of the mine, was the immediate cause of the disaster; but this is only a surmise on my part.

Assuming that the mine was generating considerable quantities of explosive gas, safety would require that the fan producing the ventilation should be capable of continuous operation. Safety would have suggested providing duplicate fans for that purpose. The fact that this fan was electrically driven introduces another element of danger, due to the possible failure of the current and the stopping of the fan at any moment.

Steam Power and Duplicate Fans Safer

In respect to safe ventilating equipment for a gassy mine, my preference would be to provide duplicate fans operated by steam power, which is more reliable for continuous service than electric current, whether purchased or supplied by the power plant at the mine. My belief is that this is the only reliable source of uninterrupted service, which is the predominant feature in the ventilation of a mine generating gas.

Aside from failing to provide safe ventilating equipment, which seems to be largely responsible for this dread occurrence, allow me to state that the mine management made a still greater mistake in not withdrawing the ten men who were entrapped by the explosion and lost their lives, and the three other men who barely made their escape from the mine. All will agree that these men should have been notified at once when the current failed and the fan was stopped. They should have been ordered to come out of the mine, which is probably required by the mining law of the state. (Colorado Mining Law, Sec. 50.)

In closing, let me say it would be of great interest to know the full details of this explosion, and understand to what extent precautions were taken to avoid such a disaster, and whether the safety rules and regulations were strictly enforced in the mine. No doubt a thorough investigation has been made, or will be made, to determine the responsibility for the occurrence. Only by that means can we increase the safety of mining operations.

OSCAR H. JONES,
District Mine Inspector.

Wilder, Tenn.

Inquiries Of General Interest

Calculating Theoretical Grade in Economie Mine Haulage

Economic Grade Dependent on Gravity System—Gravity of Loaded Cars, Less Track Resistance, Equal to Sum of Grade and Track Resistances of Empties

WE HAVE had a number of arguments regarding the method of calculating the grade of a main haulage road, in a mine, such that the same power will be required to haul the loaded and the empty cars or trips, respectively. We are asking that this question may be answered in the columns of *Coal Age*, assuming that a single car is hauled at a time, the weight of the empty car being 1,000 lb., and its weight when loaded 3,000 lb. Also, assuming a track resistance of 15 lb. per ton.

My contention is that the ratio of the weight of the loaded car to that of the empty is equal to the ratio of the sum of the track and grade resistances to their difference, which gives the proportion.

$$3{,}000 : 1{,}000 : : 15 + 20x : 15 - 20x$$

In this proportion, x represents the per cent of grade. The grade resistance per ton, for each per cent of grade being 20 lb., makes the total grade resistance for the ascending car $20x$, which is also the gravity pull of the descending car. Finding the value of x from the above proportion gives a grade of $x = \frac{3}{4}$ per cent, which some claim is wrong.

STUDENT.

Pittsburg, Kan.

In calculating the theoretical grade for economic haulage, it is true that the ratio of the weight of the loaded car to that of the empty is equal to the ratio of the sum of the track and grade resistances to their difference, approximately, ignoring some minor considerations. This being a question of the *power* required to haul a loaded car, on a certain downgrade, being equal to that required to haul the empty car up the same grade; and the power being proportional to the weight of the moving load and the net resistance, in each case, we can write the equation

$$3{,}000(15 - 20x) = 1{,}000(15 + 20x)$$

The problem assumes that the grade is in favor of the loaded cars, and the track resistance of the downgrade is then offset, in part, by the gravity of the loaded car; while, on the upgrade, the track resistance of the empty is increased by the grade resistance. The solution of this equation, expressing the equality of power in the two cases, gives for the value of x, or the percentage of grade,

$$80x = 30; \text{ or, } x = \tfrac{3}{8} \text{ per cent}$$

This is a grade of $4\frac{1}{2}$ in. per 100 ft. The only error in the correspondent's work is in finding the value of x from the proportion he has given, his result being twice too great.

Examination Questions Answered

Examination for Mine Examiners, Springfield, Ill., Mar. 19, 1923

(Selected Questions)

QUESTION—*Two airways, one circular and the other square, each have an area of 81 sq.ft.; the length of each is 2,500 ft.; what is the difference in the rubbing surfaces of the two airways; and which will pass the greater quantity of air per minute with the same pressure?*

ANSWER—The perimeter of the circular airway is

$$o = \pi d = 2\sqrt{\pi}\sqrt{a} = 2\sqrt{3.1416}\sqrt{81}$$
$$= 18\sqrt{3.1416} = 31.9 \text{ ft.}$$

The perimeter of the square airway is $4\sqrt{a} = 4\sqrt{81} =$ 36 ft. The length of each airway being 2,500 ft. the difference in their rubbing surface is 2,500 (36 — 31.9) = 10,250 sq.ft. The circular airway having the smaller perimeter and rubbing surface will pass the larger volume of air, under the same pressure. The quantities passing in the two airways will be inversely proportional to the square roots of their perimeters; or as $\sqrt{36}:\sqrt{31.9}$; or 6:5.6484; or 1:0.9414; or 10,000:9,414 cu.ft. per min.

QUESTION—*Is the amount provided by law a sufficient circulation of air in all cases?*

ANSWER—The size of the airways and passageways, in thick and thin seams, materially affects the quantity of air necessary to insure the efficient ventilation of the mine. Also, conditions in the mine relating to gas and dust, together with the depth of the workings below the surface, seriously affect the quality of the mine air. Owing to these variable conditions, the mine inspector is often authorized, by law, to require more air in circulation in a mine than what is specified in the law.

QUESTION—*Which is the easier to clean out of a room, blackdamp or firedamp? Why is this?*

ANSWER—If the room is driven to the rise and blackdamp is generated, there will seldom be any accumulation of this gas at the face. Owing to the fact that blackdamp is heavier than air, its tendency is to gravitate, which causes it to find its way naturally out of the room. On the other hand, firedamp, or marsh gas mixed in varying proportions with the air, being lighter than pure air, tends to rise and its removal is more difficult where the room is driven on the pitch of a seam.

Again, if a room is driven to the dip, any blackdamp generated at its face will have a strong tendency to accumulate there; and its removal, under these conditions, will be more difficult than the removal of firedamp generated in such a room. The firedamp being generally lighter than air, will tend to rise and escape from the room, making its removal comparatively easy.

In a practically level seam, the comparative ease with which blackdamp or firedamp can be removed from the face of a room will depend largely on the relative temperature of the air current circulating at the face of the room and the gas accumulated there. An air current having a lower temperature than that of the mine will tend to travel along the floor and will then be more effective in the removal of any blackdamp accumulated there. On the other hand, if the air entering the room has a higher temperature than that of the mine its tendency is to circulate along the roof where it will be more effective in the removal of any firedamp that may be lodged there.

QUESTION—*If when making an examination of a mine you found a large body of explosive gas state what precautions you would take to prevent an accident from the same?*

ANSWER—No attempt must be made to remove or disturb the gas, until the men working in that section or on the return of the current and especially men working in the vicinity where the gas is found have been withdrawn. These must all be warned to extinguish their lights and withdrawn from the mine or any section where they would be in danger from the gas. When the men have been withdrawn from the mine and all entrances to the affected section and the main return airway have been safeguarded the fireboss, with a few competent men to assist him, must approach the accumulated body of gas from the intake side. If possible to do so without damage to the circulation in other parts of the mine the air current must be increased in the affected section. No open lights must be permitted in the performance of the work, which will consist in the erection of brattices to direct the air current so as to gradually sweep the gas from its lodgment, making careful tests from time to time to ascertain the progress of the work. Finally, the entire section must be thoroughly examined and reported safe, before men are again permitted to enter for work.

QUESTION—*Explain the symbols CH_4, CO_2, SH_2 and CO, stating what are their comparative weights.*

ANSWER—The symbol CH_4 indicates a molecule of methane or marsh gas, consisting of one atom of carbon combined with four atoms of hydrogen. Calling the weight of hydrogen 1, the weight of an equal volume of methane or marsh gas is 8.

The symbol CO_2 represents a molecule of carbon dioxide, consisting of one atom of carbon united to two atoms of oxygen and its relative weight or density, referred to hydrogen as unity, is 22.

The symbol SH_2, more commonly written H_2S, represents a molecule of hydrogen sulphide, or sulphureted hydrogen, as it is sometimes called. Its relative weight is 17.

The symbol CO stands for one molecule of carbon monoxide and its relative weight is 14, referred to hydrogen as unity.

QUESTION—*A current of 3,000 cu.ft. of air is at the explosive point; how much fresh air must be added to prevent a cap?*

ANSWER—The detection of a cap in a safety lamp will depend largely on the observer and the kind of lamp used. If the volume of air in this case is 3,000 cu.ft. and the mixture of air and gas is at its most explosive point, containing 9.46 per cent of gas, the proportion of air in the mixture is 100 — 9.46 = 90.54 per cent. The volume of the mixture is, therefore, 3,000 ÷ 0.9054 = 3,313 cu.ft. The volume of gas in this mixture is 3,313 — 3,000 = 313 cu.ft. Now, assuming that the first indication of a gas cap appears when the gas forms 2 per cent of the mixture, the volume of gas and air when the cap is first observed, is 313 ÷ 0.02 = 15,650 cu.ft. Finally, the volume of air necessary to be added to produce this condition is 15,650 — 3,313 = 12,337 cu.ft.

Gandy Finds Strong Midwest Sentiment for Maintenance of National Organization

No collapse of the coal market is in prospect, in the opinion of H. L. Gandy, the executive secretary of the National Coal Association, after an extended trip through the coal-producing centers of the Middle West and the Intermountain section of the country. Throughout his trip he heard much talk about plans for storing coal but he saw no evidences that more than the normal amount of storage has been made. While he is not convinced that large consumers will place more coal in storage this summer than they have during other summers, he points out that any effort to that end now necessarily must be confined to the latter half of the summer.

In his conversations with operators everywhere Mr. Gandy found that there is a keen realization that a national organization must be maintained. Many operators who at this time are not affiliated with the National Coal Association are looking with approval on the work that it is doing. There is wide appreciation, Mr. Gandy says, of the work being done by the Brydon committee.

Indiana Operators to Pay State for Coal Mined Under Wabash River

Controversy over the ownership of coal under the Wabash River, which has been before the courts, ended in a sweeping victory for the State of Indiana, June 11. Representatives of coal companies, in conference with the Conservation Commission, agreed to pay the state 4½c. a ton for all coal mined before the beginning of the suit to test ownership of the fuel. For all coal mined after the filing of the suit and for all coal mined in the future, the state will receive 10c. a ton.

John W. Holtzman, a member of the Conservation Commission, who acted for the commission, said that a survey will be made by the state engineering department and representatives of the companies to determine the amount of coal which has already been mined. Payment to the state will be based on the results of this survey, Mr. Holtzman said. In the future, all coal will be mined under permits received from the conservation department and payment will be made to the state under the terms of the agreement. It is estimated that more than 9,000,000 tons of coal was involved in the controversy. Representatives of the following coal companies participated in the conference: Western Indiana Coal Co., Coal Bluff Mining Co., Lower Vein Coal Co., Grasselli Co., Miami Coal Co., Ferguson-Spears Coal Co., and Jackson Hill Coal & Coke Co.

Southwest District Operators Pessimistic In Annual Meeting at Kansas City

Pessimism, deep dyed and malignant, characterized the annual meeting of the Southwestern Interstate Coal Operators' Association in Kansas City, June 12. So gloomy, in fact, was much of the discussion of conditions of the last year that its details are being guarded as might be the darkest secrets of an abandoned past. It was to the general effect that for twelve months the Southwest had been struggling in the wilderness and deliverance from out of the hands of its enemies was not yet.

Much blame for the situation was placed at the door of labor. The general sentiment was that, with the present high wage scale, the Southwest could not produce coal at a price to compete with other fuels. "The present scale may be fair enough in thick-seam fields," W. L. A. Johnson, commissioner, said, "but in our mines of from 20-in. to 48-in. seams, it is virtually confiscatory."

During the strike last year many industries and railroads turned to oil. Many more have changed in recent months. "The fact that they would be assured of a steady supply actuated most of these buyers to install oil burners," Mr. Johnson said. "Every day present conditions continue their remedy becomes more difficult," Mr. Johnson said. "Many smaller industries are being driven out of this district by the cost of fuel. They are being beaten by competitors in other districts who obtain their fuel more cheaply."

Anthracite Operators Submit Brief on Competition in Hard-Coal Industry

"Competition in the Anthracite Industry" is the subject of a 71-page statement submitted to the U. S. Coal Commission on June 13, 1922, by Walter Gordon Merritt, counsel for the General Policies Committee of the Anthracite Operators.

This brief sets forth "that conditions in the anthracite industry are highly competitive, and there is a notable lack of any dominating influence or power on the part of any one company or co-operating group of companies." It is pointed out that the popular impression of a combination in the anthracite industry grows out of past litigation forcing a separation of railroad and mine operations and dissolving intercorporate relations, which were held by the courts to be in restraint of trade. The impression, based on happenings in the past, has outlived the conditions to which it owed its origin, but the public is reluctant to surrender it or to give up the idea that some definite wrongdoing practiced by the operators explains the present high cost of anthracite.

The statement sets forth that there are no interlocking stock ownership or interlocking directorates and that "none of the suits or investigations involving the anthracite companies, at least in so far as they related to practices within the last twenty years, disclosed secret meetings, understandings or agreements or any so-called 'open-price plan' whereby price information was exchanged between competitors." To demonstrate how completely the company operators had discontinued the practices which, beginning in 1912, were challenged by the Supreme Court and later by the Interstate Commerce Commission, each charge is dealt with separately and each of the companies and principal anthracite railroads had included statements in regard to its business practices and history of its organization.

It is pointed out in Mr. Merritt's statement that there is no dominating interest in the industry since the largest company produces about 15 per cent of the total production. It is noted that the total output marketed by the independents has increased since 1902, that the 65 per cent contracts were discontinued in 1916. It is argued that "active competition with all of its symptoms—with its fortunate and unfortunate aspects—exists." There is no apportionment of territory, according to Mr. Merritt, in support of which is submitted a list of one thousand typical communities in the United States showing the shipments made to each and the number of Company and independent operators supplying trade in these communities. "No monopoly would tolerate such an unregulated method of distribution," says Mr. Merritt.

There is no curtailment of output except by the union and there is competition in price, it is stated. The steps taken to accomplish the segregation of railroads and coal companies is set forth fully in detail. Mr. Merritt remarks in this connection that "whether this national policy of dismemberment be wise or unwise we do not now discuss," and notes that "this requirement of segregation was a marked reversal of the established legislative policy in the past."

Referring again, in his conclusion, to the popular misapprehension regarding competitive conditions in the anthracite industry, Mr. Merritt said: "If this can be corrected and a fair understanding of the facts promoted, it will spare the industry much futile and misleading criticism and to that extent will serve to remove one of the barriers to better understanding in dealing with employees and the public."

IT IS REPORTED in Washington that the Interstate Commerce Commission has reached a decision on the assigned-car case and that its report and decision has been sent to the printer. Speculation is rife in Washington as to the direction of this decision and everyone interested in railroads and coal is awaiting release of the report, which is expected soon.

Coal Dealers, in Convention at Providence, Discuss Problems Affecting New England Trade

Disapproval of attempts by State Legislatures to set up local standards of preparation of anthracite and appealing to Congress to speedily enact a law that shall establish a standard of quality was expressed in a resolution adopted by the New England Coal Dealers' Association at its annual convention held on June 13, 14 and 15 at Providence, R. I. The association disapproved of the reported intention of the U. S. Coal Commission to include in its report a recommendation that the 2,000-lb. ton for coal be fixed. Other resolutions adopted included one for the sealing of barges, that a committee of three be appointed by the president of the association to bring about better relations between the retail dealer and wholesale distributors, and that a committee composed of three dealers from each state represented in the association be appointed to act in cases of emergency, especially relating to proposed legislation affecting coal.

It was the first time in its twenty-one years of existence that the association has held its annual meeting outside of Massachusetts. The convention was held in the State Armory, part of which was devoted to an exhibit of coal-handling machinery. W. A. Clark, of Northampton, Mass., president, presided. In his address of welcome Joseph H. Gainer, Mayor of Providence, asked that something be done so that coal consumers would be assured of a supply of coal in the summer.

T. L. Lewis, a former president of the United Mine Workers of America and now secretary of the New River Coal Operators Association, who spoke at the afternoon session of the first day of the convention, approving Mayor Gainer's suggestion for early summer buying, declared that the retail dealers occupy a position equal to that of the men who swing the pick and shovel. He said if the dealers acted as a unit no law would be passed by law-making bodies to regulate their business. He urged the dealers to induce their customers to put in at least part of their winter coal during the summer.

Mr. Lewis hoped that the U. S. Coal Commission would recommend some tangible proposition that will make strikes impossible and at the same time give a fair deal to both operators and miners.

He opposed any organization that can compel 110,000,000 persons to get down on their knees. Such an organization should be curbed, he said. Saying that soft coal is now being sold at less than cost of production, Mr. Lewis said that consumers of coal seem to the indifferent and if they do not buy at least a part of their requirements now they will pay the penalty in higher prices in the near future.

At the session on the afternoon of June 14 Dr. E. W. Parker, of the Anthracite Bureau of Information, told the dealers that ordinarily the six New England States purchase and consume something over 15 per cent of the domestic sizes of anthracite marketed in this country—that is, of the total production less shipments to Canada and small quantities exported to other countries. In the coal year 1921-22 the total domestic distribution of domestic sizes of anthracite was 38,118,952 gross tons, exclusive of shipments made by the Hudson Coal Co. Of these 38,000,000 tons the New England States took 6,429,471 tons. The allotments made to New England for the period from the time mining began, Sept. 11 to March 31, 1923, totaled 3,857,673 tons, this being on the basis of 60 per cent of the shipments made in the preceding coal year. The quantity of anthracite shipped against these allotments amounted to 4,083,066 tons, or more than 225,000 tons in excess of the allotments.

"Transportation" was the subject of an address by R. H. Newcomb, executive assistant to the president of the Boston & Maine Railroad Co. Referring to a previous statement that "fireproof" coal had been shipped into New England, he said that the Boston & Maine had purchased 400,000 tons of English coal which could have been named "fireproof" coal. He told the dealers that during the period from September, 1922, to April 1, 1923, his road had delivered more than 40,000 cars of anthracite.

President Clark said that those dealers who had not received the questionnaire sent out by the U. S. Coal Commission were lucky. He did not know exactly what is to be done with the information obtained from them. Mr. Clark was for the twelfth time elected president of the association. Others elected were: Treasurer, G. A. Sheldon, of Massachusetts; vice-presidents, James B. Gregory, of Connecticut; J. C. Miller of Maine; G. L. Miner, Providence; H. A. Osgood, of New Hampshire; N. E. Pierce, of Vermont, and E. A. Wilson, of Massachusetts; elected to the Executive Board (to serve for three years), J. F. Higgins, Vermont, and H. L. Miller, of Worcester.

Will Continue Strike in Somerset County

At a meeting of representatives of twenty-three locals of the United Mine Workers in Somerset County held in Johnstown on June 7 it was decided to continue the strike in that field. The meeting was attended by President John Brophy, Vice-President James Marks and Secretary-Treasurer Richard Gilbert, of District No. 2, and National Board Member John Ghizzoni, of Homer City. A resolution was adopted setting forth the grievances of the strikers, expressing appreciation of the assistance accorded by the union miners and voicing unanimous decision to continue the strike for a union contract and recognition of the United Mine Workers.

"It has been carefully estimated," said J. S. Brennen, secretary of the Somerset County Coal Operators' Association, "that it has been costing District No. 2 (central Pennsylvania) between $45,000 and $50,000 a month to support the Somerset outlaw strike since its abandonment by the national union organization last fall.

"There are in Somerset County 13,000 non-union mine workers employed at a scale of wages higher than the union scale. There are, by actual count, on strike in Somerset County, 1,157 men.

"Brophy is skillfully spotting these 1,157 strikers all over Somerset County in small groups. Each small group, some of them not numbering more than ten or twelve, constitute, under the United Mine Workers' constitution, a local union. All of these so-called locals, engaged in an outlaw strike, are being supported by Brophy, with union money.

"In this way, by spotting, Brophy continues to increase the number of delegates among the 1,157 Somerset strikers. It follows that when these 'mushroom' delegates attend the International Convention, having been living off union money handed out to them by Brophy, they will vote on all questions as Brophy men." According to Mr. Brennen, this is a part of Brophy's campaign to succeed John L. Lewis as president of the United Mine Workers.

At the Johnstown meeting a letter was drafted and sent to Governor Pinchot asking protection for strikers against hired guards and strike breakers at the plant of the Hillman Coal & Coke Co. at Jerome.

THE IMPORTANCE OF COAL STORAGE, not only to the railroads but to consumers generally, is stressed in a letter from Secretary Hoover to J. N. Clark, president of the International Railway Fuel Association. He recommends, however, that more attention be paid to the economic side, especially costs, investment charges and the general economic value of storage, a subject on which, he says, there is insufficient data. Referring to the work of the association on fuel conservation, Mr. Hoover says that there is still a large amount of it to be done in this field along the line of greater use of the lower-grade coals. The nation, he points out, has tremendous reserves of those coals. He also stressed the importance of closer co-operation on the part of the railways generally with coal producers, individually and with their associations.

Illinois Operators Present Five Briefs On Coal Problems of That State

Five briefs dealing with problems of the coal industry in Illinois were filed with the U. S. Coal Commission on June 18 on behalf of the Illinois Coal Operators' Association, the Coal Operators' Association of the Fifth and Ninth Districts and the Central Illinois Coal Operators' Association. The briefs were presented by a committee of Illinois operators and a representative of counsel for the Bituminous Operators' Special Committee.

The most important of the briefs, entitled "Union Mine Labor in Illinois and the Determination of Wage Scales and Working Conditions," states that there has ceased to be any real collective bargaining with the miners' union in Illinois, as there is a complete monopoly of coal-mine labor, controlled by a small, centralized body of union officials which is entirely irresponsible in a legal sense. This monopolistic control has placed the coal industry in Illinois on a most unstable basis. It is further pointed out that during the last 25 years the mines of Illinois have been idle on account of strikes called by the United Mine Workers for 8 per cent of the time, and such interferences with production are becoming more and more common. A classified list of strikes and violations of contract given covers 62 pages.

Some of the causes for which strikes have been called, according to the brief, are: Attempts to weaken the authority of the management and to control the working force in violation of contract, opposition to recommendations of state mine inspectors, opposition to the introduction of labor-saving machinery, and sympathetic strikes.

Two of the briefs deal with mining-machine differential in Illinois. The differential made between machine mining and pick mining the brief states, is only 7c., as contrasted with much higher differentials in other states, the result being a great increase in mining costs, so that Illinois operators have suffered greatly in competition with operators of other states. The fourth brief points out various ways whereby increased safety and economy in mining may be effected. It is stated as desirable that specially trained men be provided to undercut the coal and to place explosives and fire charges, thus reducing the cost of producing coal and promoting the safety of the miners.

The final brief, which is a reply to the statement made some time ago to the Coal Commission by the Northwestern Dock Operators' Association, states that more economical distribution of coal to parts of the Northwest can be made by rail from the Illinois fields than by rail and water shipment via the Great Lakes route. It also points out that the only way in which coal can be stored economically is by storage at the point of consumption, and that intermediate storage, such as is involved in rail and water shipment, results in serious deterioration of the coal.

Central Pennsylvania Tells Commission How To Cure Every Ill of Coal Industry

Suggestions offered as the cure of all the ills of the coal industry were given the U. S. Coal Commission by the Central Pennsylvania Coal Producers Association in their report to the commission June 18. In 100 pages these operators of a district employing about 60,000 miners and producing between forty and sixty million tons of coal a year give the commission six cures for strikes, four causes of overdevelopment of mines that should be removed, and ask that assigned cars be abolished. They deny that the industry is as badly overmanned as is alleged. The report is signed by B. M. Clark, Harry Boulton, A. M. Liveright, Charles O'Neill and W. A. Jones.

The brief deals with a large number of subjects now under investigation by the Coal Commission. It sets forth that since April 1, 1916, two general and 664 local strikes have taken place in this district in violation of contract on the part of the United Mine Workers of America.

To eliminate these strikes in the coal industry the operators recommend:

(a) Abolition of the check-off; (b) re-establishment of real collective bargaining upon the basis of district or sectional wage agreements; (c) collective and individual legal responsibility upon the members of the United Mine Workers of America for carrying out their contracts; (d) placing wage rates in the mining industry upon a parity with other industries employing the same classes of labor; (e) the absolute right to introduce labor-saving devices and machinery without interference by the union; (f) the inclusion of arbitration clauses in all wage agreements similar to those contained in the central Pennsylvania district agreement.

Facts are set forth to prove that collective bargaining has been destroyed by the United Mine Workers through their frequent violations of agreements, and to bring about a proper re-establishment of joint relations in the mining industry the union and its members must be made legally responsible for carrying out and enforcing wage agreements.

On the matter of overdevelopment the operators disagree with the commonly accepted statement that there are 200,000 too many men in the industry. To meet the requirements of the country for coal there is not more than 8 to 11 per cent excess development, they say. Likewise there are only 50,000 to 66,000 too many men in the industry.

The operators state that this overdevelopment in the industry is due to the following causes: (1) The accessibility of coal and the small initial investment required to open a mine. (2) The development of wagon mines, especially by war-time premium prices for their coal. (3) The contest between coal-carrying railroads for the development of coal fields to insure (a) their fuel supply, and (b) secure revenues. (4) The uniform and inflexible policy of the United Mine Workers of America in maintaining a fixed wage scale in the union fields for long periods in the face of changing conditions allowing the non-union coal operators to properly meet changing conditions by adjusting wages as conditions warrant.

The operators also ask for the abolition of assigned cars as unjust, inequitable and discriminatory. They say the abolition of this form of special privilege will do more to stabilize the bituminous mining industry than any other single proposition that the commission can recommend.

The brief also deals with the history of the district, wage rates, storage of coal, housing and cost of living, open-shop mines, intermittency, absenteeism, competition, and recommends the industry be granted the right to properly disseminate information concerning prices, production, etc., so that the public may be correctly informed as to the situation at all times. The operators suggest a public hearing on labor relations, and conclude with the statement that if their recommendations are carried into effect the operation of economic law "will adjust all of the evils supposed to exist in the bituminous-coal mining industry within a reasonable time."

Capellini Leads Brennan in Election for Presidency of District 1, Is Report

Rinaldo Capellini, so-called insurgent, has defeated William Brennan, Scranton, a conservative, for the presidency of District No. 1, United Mine Workers of America, leading Brennan by some 4,500 votes it is reported.

Brennan was the John L. Lewis candidate for office and it is expected by many that this change is likely to have a strong influence in governing the demands of the mine workers when negotiations for a new agreement are made on June 26 at Scranton.

Fewer strikes and better enforcement of union laws was promised by Capellini when he was told of his victory.

A DECREE FOR THE COMPLAINANTS, the States of Pennsylvania and Ohio, against the State of West Virginia was directed by the Supreme Court, June 11, in suits instituted to restrain West Virginia from putting into effect a law compelling natural-gas companies to serve consumers within the borders of West Virginia in preference to those outside that state, in the case of gas taken from within the state. The decision was by a divided court, the majority opinion being based on the public interest.

Wholesalers in Convention Decide to Set Up System Of Arbitration to Reduce Court Difficulties

No fighting issues faced the American Wholesale Coal Association at its seventh annual convention in Cincinnati on June 12 and 13, consequently attendance was only 105 on the registry, but never more than 75 of these assembled at any one time and discussions seldom waxed warm. However, the association took an important step in deciding to inject more arbitration into the business disputes hereafter; it displayed some interest in a better credit reporting service and in the doctoring of transportation ills hanging over harassingly from the war and it elected Charles L. Dering, of Chicago, president after a small disturbance in the nominating committee. Pittsburgh had hoped to land the presidency for Jay Johns, but finally yielded. The next convention city is to be chosen during the winter.

Arbitration of disagreements between wholesaler and either producer or consumer of coal may hereafter more often settle difficulties out of court. The association expects to create an arbitration bureau of its own through which the doctrine can be preached and turned into practice. Association members are expected to see that clauses are written into all contracts committing both sides to arbitration by a man representing each party plus a third man chosen by the two. A great deal of educational work along this line is to be done beginning at once.

The 1922 offer of Colonel Sanborn, of Chicago, to turn over his credit bureau to the association was considered, E. M. Platt of Chicago spoke convincingly of the need for more careful credit work, and it was resolved by the association that the Sanborn plan be given more complete support by wholesalers. A circular explaining it will be sent to all members; they will be encouraged to report credit experience on the Sanborn forms and those who do not will be questioned by the association's executive committee.

The officers for the new year are Charles L. Dering, president; Borden Covel, of Boston, vice-president, and George H. Merryweather, of Chicago, secretary-treasurer. The executive committee is W. W. Weller, Jr., of Birmingham, Ala.; J. W. Dykstra, of Detroit; Jay W. Johns, of Pittsburgh; Jean Astel, of Cleveland; Carl A. Owen, of New York; G. W. Hill, of Cincinnati, and Harry Courtwright, of Philadelphia. The board of directors is composed of the executive board plus C. G. McGill, of Toronto, Can.; C. L. Clark, of New Haven, Conn.; A. J. Cochran, of Indianapolis, Ind.; B. J. Read, of Baltimore, Md.; C. A. Weinhart, of Grand Rapids, Mich.; R. H. Lee, of Kansas City, Mo.; F. S. Martin, of Omaha, Neb.; C. F. Westfall, of Omaha; Mark A. Thompson, of Syracuse, N. Y.; J. A. Collett, of Pittsburgh, Pa.; W. J. Hamilton, of Columbus, Ohio; G. H. Snowden, of Pittsburgh, Pa.; W. J. Prescott, of Memphis, Tenn.; R. R. McFall, of Morgantown, W. Va.; W. C. Maas, of Milwaukee, Wis.; Allen Parks, of Uniontown, Pa.; Andres Johnson, of Toledo, Ohio, and one more to be chosen.

In his report reviewing the year, sounding a warning against blindness to the dangers threatening the coal industry and appealing for more hearty interest in association activities retiring president Seth W. Morton, of Albany, N. Y., had this in part to say about relations between wholesaler and the commission: "The largest single question before the association today is its relations with the U. S. Coal Commission. Since the creation of that body the association has sought to be helpful in disposing of the vast task confronting the commission. I am glad to say that from the outset to this hour our relations have been most happy and cordial. The one outstanding feature of the commission is its spirit of absolute fairness and its obvious desire to arrive at the facts. We look forward with hope to the potential good that can be accomplished as a result of this investigation."

Secretary-Treasurer G. H. Merryweather reported that the membership of the association is now 420 as compared with 422 at the time of last year's convention in Detroit and that the disbursements of the association have decreased $9,856 as compared with last year, when the commissionership at Washington was combined with the traffic managership.

At the opening session of the convention Tuesday, June 12, R. S. Bain, of Cleveland, speaking on the subject of better accounting, said that wholesalers lose much money every year by bad accounts, the making of unfair deductions, the unfair refusal of coal and the cancellation of orders on falling markets. He recommended the creation of bureaus of adjustment and inspection at all important coal centers,

to which shippers could report troublesome cases as soon as they arise. A bureau inspector could be put on each case.

"Send in that data," was the urgent appeal which C. A. Owen, of New York, made to the association at the opening of a sparsely attended Tuesday afternoon session. He was speaking of the information requested in the three forms for the U. S. Coal Commission. "Some day soon we are practically certain of having to appear before a congressional committee," said he. "We want to be prepared."

"The fear of God" might be a fitting title for what Franklin Bache, president of the Coronado Coal Co. and member of the Bituminous Operators' Special Committee, tried to put into the hearts of the wholesalers. He hoped to rouse his hearers to the danger that now besets not only the whole coal industry but all industry and business and to move them all to accept every opportunity to preach anti-government control.

Jay Johns, of Pittsburgh, at the Wednesday morning session declared forcefully for a discontinuance of a lot of railroad practices allowed to outlive their war-time usefulness. Permissive embargoes is the worst of them, he said. The system which allows a railroad to allot cars to a single mining company and even to a single mine for shipment of coal to some one or two coal-needy consumers during a period of embargo is wrong and is "the rawest thing yet pulled." This and the existing rules on reconsignment and diversion should be prohibited, he insisted.

Ira Cochran, commissioner and traffic man at Washington for the association, said the railroads hold that permissive embargoes are necessary even though admittedly unfair. By no other means thus far conceived is it possible to keep a distressed plant from shutting down in time of embargo. They admit the plan usually works to the advantage of only shippers who happen to "stand in" with the right railroad man. The association has asked attorneys if the practice can be stopped with injunctions, and the decision is that the remedy must be obtained through the Interstate Commerce Commission.

He said the association may soon get a hearing before the Interstate Commerce Commission on proposed changes of reconsignment and diversion rules. He told the association that the movement to get freight claims speeded up is advancing. Already the Baltimore & Ohio R.R., long considered backward—to use a term more charitable than is customary in the coal trade—is now at the forefront in the matter of auditing freight bills on coal. They all go through revision bureaus now working in such centers as Cincinnati and are audited before the coal reaches the consignee. The system catches many errors that otherwise would lead to claims rising to plague both shipper and carrier for two or three years.

Middle West Makes Progress Toward Mechanical Loaders

Further progress toward the recognition of mechanical underground loaders in the Middle West was made last week. The abortive strike at the new Orient No. 2 mine of the Chicago, Wilmington & Franklin Coal Co. was settled by the 300 strikers going back to work at the old terms, and in Indiana the union officials of District 11 agreed to meet operators in a joint conference to discuss fixing a wage scale for loader operators in that state. This movement in Indiana by no means indicates that a scale can soon be agreed upon but it is significant that the union is willing to negotiate. Both sides have chosen their representatives but no time has been set for the first meeting. It is expected before July 1.

For about eight months in Indiana loaders have been working in two mines. The difficulty of getting cars to them fast enough has been a constant problem. Other engineering difficulties have been many and many have been the schemes conceived to overcome them. Among these is a plan to load room coal at the neck of each room by spotting the loader there and dragging the coal to it by a dragline conveyor. While the loader stood in the neck, empty trips for loading could be drawn past it on the entry track. The machine could be moved from neck to neck, it is expected, thus widening its field, increasing its speed and generally overcoming many of the difficulties of using the loader in room work. At present, operators of loaders in Indiana are paid $12 a day.

In the Orient No. 2 mine in Illinois they had been receiving $8.56 and struck the mine to compel scales to be installed, and the mine shifted from a day-wage development basis to a tonnage rate. This would have compelled the fixing of a loader scale. The strike was unauthorized by the district union organization and the men last week, after having had a vacation, went back to work on the old basis.

But the battle over loader pay in that state is only postponed. The Orient No. 2 mine is rapidly growing beyond the development stage and will soon require a loader scale if loaders are continued in the property, as Illinois operators hope they will be. Meantime discussion of loaders goes vigorously on among every class of mining men in the Middle West. A discussion on the last day of the Illinois Mining Institute's boat trip up the Illinois River June 7 to 9 was typical. It followed a paper by L. E. Young, president of the Union Colliery Co., on the use of a Shuveloder on rock work in the Kathleen mine, at Dowell, Ill.

A discussion followed Mr. Young's paper which made it evident that mechanical loading of coal is recognized by engineers and mining men generally as the coming thing. Mr. Garcia declared it is forcing a general revision of methods in the coal industry all the way from face to tipple and even beyond, because of the speed, economy and general desirability of loaders are compelling use of the machine by the industry and because mining practices will be made to conform to the machine instead of *vice versa*. The mechanical loader to get out the coal and the skip hoist to rush it to the surface, he said, are a pair which will not be denied entry into the coal industry.

Other men present, such as John Land, mine superintendent for the Old Ben Coal Corporation; Douglas Corner of St. Louis; Mr. Tirre, Inspector English, President Millhouse, J. Milton Duff and F. F. Jorgensen, chief engineer of the Superior Coal Co., all contributed comment and suggestion proving beyond doubt the lively interest in loaders that exists in Illinois.

It was brought out that a type of loader in Pennsylvania gets out coal at an average loading cost of $1.40, but that in West Virginia the average in a loader mine with 6-ft. coal is only 83c. They reviewed something of the experience in Indiana, where $12 a day is paid operators in two mines, but where obstacles of every kind are put in the way of the machines and where great difficulties are encountered in getting empty cars to the machines speedily enough.

Labor troubles stirred up by loaders was much discussed, everybody recognizing that that is a vital factor in the problem of introducing the machines. It was stated that one of the principal reasons why the loader idea is now forcing itself swiftly into the whole industry is the obstreperousness and offensive independence of union labor.

"Two men will do the work of ten," was the common statement in the labor discussion. "The union will fight hard to save the other eight their jobs."

"But the industry will benefit in more ways than one if the eight go," contributed an engineer. "For one thing the two who stay to run the machine will be higher grade men and the low-grade element in mine labor will be reduced, thus possibly putting more intelligence and less radicalism into labor relations between operators and the union."

Can Steady Coal Industry by Early Buying, Says Columbus Chamber of Commerce

"If a large majority of domestic consumers of coal could be induced to purchase their coal supply during the summer months, they would benefit as individuals by getting their coal at a cheaper price and the movement also would tend toward stabilization of the coal industry," according to a report by the Chamber of Commerce coal committee appointed to investigate the coal situation in Columbus, Ohio.

Recommendations were made that an educational campaign be started, to teach the people the value of buying their coal early and that employers be urged to assist in this campaign in such manner as deemed by them most effective and advisable.

Coal Commission's July 1 Report Holds Deep Interest In Light of Recent Supreme Court Decisions

By Paul Wooton
Washington Correspondent of *Coal Age*

A vigorous expression of views in the matter of nationalizing coal mines may be expected in the anthracite report to be made July 1 by the President's Coal Commission. Chairman Hammond, of the commission, stated last Friday that the report will contain a discussion of the whole subject of nationalization. Another pronouncement expected in the report will deal with the basis of evaluating coal properties.

The soft-coal operators, in a statement dated June 14, contend that the only equitable method of establishing valuation would be on the present market value of the properties. They deny that original cost is of value in determining present worth. To support that contention, it is pointed out that an operator who has come into the business recently would have to have his valuation established on present market price, whereas an old-established adjacent concern producing the same quality of coal under the same conditions would have his valuation based on original cost. The operators also are opposed to the Treasury method of valuation, wherein the 1913 value plus actual additions since is used.

The whole matter of valuation has been illuminated by recent decisions of the U. S. Supreme Court, to which the commission is paying the closest attention. In the opinions rendered in connection with the Southwestern Bell Telephone Co. case an analysis is made of the Supreme Court's decisions bearing on valuation. In 70 of those cases the predominant element in valuation was reproduction cost. In 118 cases the predominant element was original cost modified in various particulars. In 28 cases the chief element was book value. In 12 cases the capital represented by bonds and stock was accepted. In 102 cases a prior valuation plus the actual cost of subsequent additions was accepted.

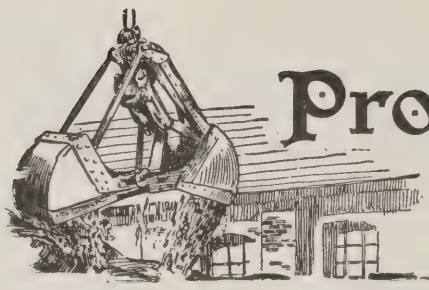
It is quite evident that the commission cannot undertake careful evaluation of coal mines after the fashion of public-service commissions in the case of public utilities. To undertake this would require years of time and not less than $2,000,000 in money. It is believed, however, that the commission will have something interesting to say as to methods of evaluating which best can be applied to coal mines. Incidentally any recommendations on that subject will be of great interest to those concerned with the resources of which there is only one crop.

Unquestionably the commission is giving close attention to the Supreme Court's decision in the Kansas Industrial Court case, in which a distinction is drawn between the mining of coal and the services coming under the head of public utilities. The decision also is certain to be considered by the commission in respect to its bearing on the settlement of disputes between employer and employee. The Court's position that the fixing of wages by a tribunal with compulsory powers is a denial of freedom of contract under the Fourteenth Amendment to the Constitution is certain to have a bearing on what the Commission may say in regard to improving the present conciliation machinery in the anthracite region. Apparently the Supreme Court has shut the door to any possibility of requiring operators and miners to submit a dispute to compulsory arbitration unless the commission should take the position that the production of coal is a public-utility industry.

All of the fundamental data on which the anthracite report will be based was in hand on June 15. That it is voluminous may be judged from Mr. Hammond's statement to the effect that the documents cover 200 sq.ft. to varying depths. All of the data on which conclusions will be based are to be made public. Proper safeguards will be employed to protect legitimate business secrets. Since some arrangement and summarization will be necessary to make all of this information readily understandable, it is probable that it will be released periodically following the issuance of the report itself.

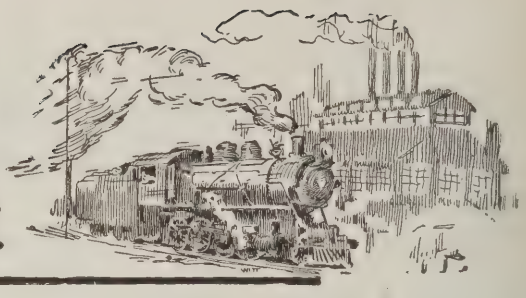
Brydon to "Knock Hell Out of Facts That Are Not Facts" in Commission Reports

"If any facts which are not facts appear in the reports of the U. S. Coal Commission, we'll knock hell out of them," declared J. C. Brydon, chairman of the Bituminous Operators' Special Committee, to the Fayette-Green Coal Producers' Association in Pennsylvania June 14. The vitriolic-tongued chairman of the special committee wasn't threatening the commission itself but only "facts that are not facts." If the threat has to be carried out, he said, the special committee will then present to the commission a statement of facts which must be found. In case of a disagreement over these between the committee and the commission, the Brydon committee will demand public hearings, and "will get them." Thus was the calm of the Fayette-Green association meeting enlivened in the Summit Hotel, six miles east of Uniontown, in the Allegheny Mountains. About 250 men were present, representing 87 per cent of the coal mined and 90 per cent of the coke produced in that part of Pennsylvania.



What Mr. Brydon had to say regarding the work of the Bituminous Operators' Special Committee was of particular interest to the operators. His talk dealt entirely with the history, policies and activities of his committee. Mr. Brydon said that the Coal Commission in a period of twelve months can only begin to arrive at an understanding of the industry. A thorough study would require as many years.

He said the vacation trip of John L. Lewis is suspected to have been a ruse to get the sympathy of English miners to support the propaganda for 100 per cent unionization in the coal industry of this country. This is Lewis' dream of world empire, which if consummated would give him complete control of all industries. The special committee, consequently, authorized two men to go abroad to study labor conditions in Europe so that plans might be made to thwart the future steps of Mr. Lewis.



T. W. Guthrie, president of the Hillman Coal & Coke Co., spoke first, emphasizing the necessity among coal operators for co-operation, which is best realized through association. Industry is best protected by combined efforts because soundest advice does not come from an individual but rather from joint counsel. Moreover, the first line of defense in fighting the antagonistic moves of enemies of the coal industry is the local operators' association, while the last ditch is the National Coal Association.

Because a movement is on foot to bring about the nationalization of the coal industry as well as the railroad industry, the two should join forces to avert disaster which would certainly follow such a law, according to H. C. Clevenger, coal freight agent for the Pennsylvania R.R. W. G. Curren, general superintendent of transportation of the Baltimore & Ohio R.R., said that the interest of railroads in the present coal situation is secondary only to that taken by them in the problems which confront the carriers. The outcome of the present coal situation will be reflected upon the railroads in that 40 per cent of all tonnage handled by rail is coal and because the railroads now consume 28 per cent of the yearly production of coal.

Rebutting a statement made by Mr. Clevenger that present freight rates need no adjustment, J. D. Battle, traffic manager of the National Coal Association, said that coal men were vitally interested in the matter and would favor certain changes. The railroads are facing a crisis as serious as that of the coal industry, said Colonel H. C. Nutt, president of the Monongahela R.R.

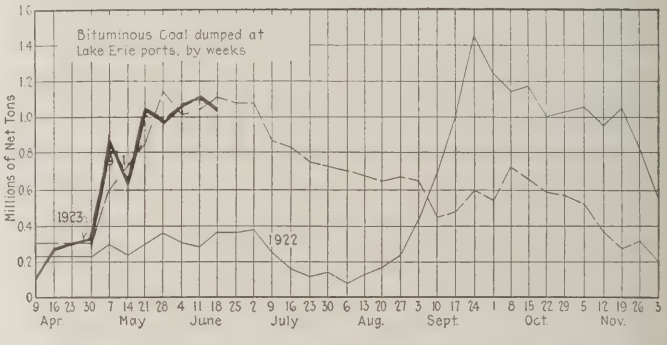
Production and the Market

Weekly Review

Declining prices on soft coal have not affected demand and the production of bituminous coal continues at a level little short of 11,000,000 tons per week. That this country should have a production of 227,780,000 net tons of soft coal during the first five months of this year—exceeded only by the same period of 1918—with conditions in the market as quiet as they are is attributed to the productive capacity of the industry and evidence of its willingness to perform when it has abundant labor and even fair car supply.

A few probably appreciate that the production of anthracite at the end of May is the highest ever recorded in the corresponding period. May 31 this year the production of anthracite was 42,504,000 net tons, which is at the rate of 103,000,000 tons a year, as compared with the previous annual record of 99,000,000 tons in 1917. That there has been no need for a drive to induce householders and retail dealers to take in anthracite for the possibility of a strike on Sept. 1 is quite generally appreciated.

Railroads Increase Stocks of Fuel Coal

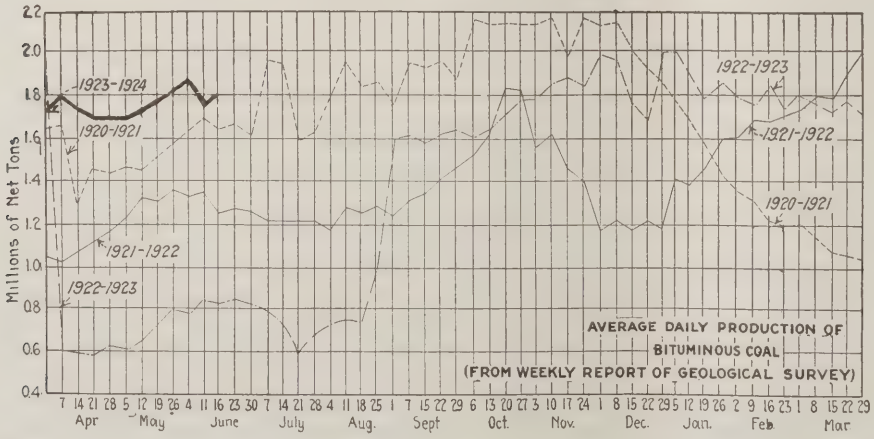


The drive behind the high rate of bituminous coal production comes from two sources: The Secretary of Commerce in Washington and the railroads. Railroads, for instance, have increased their stock of fuel coal from about six and three-quarter million tons in cars and on the ground on Jan. 1, when normally they carry large reserves, to eight and a half million tons on June 1. About a million tons of this was added in May. Working through associations and every form of organized industry the Department of Commerce has urged the storage of coal this summer.

As the railroads offer better transportation service to the soft-coal mines, reports of lost time because of no market increase. *Coal Age* Index of spot prices of bituminous coal dropped 5 points last week to 210 on June 18, which corresponds to an average price of $2.54. Slight advance in eastern Kentucky and Hocking were more than offset by declines in western Kentucky, Ohio No. 8, Pittsburgh and the eastern low-volatile fields, while Western coals stood still.

The principal markets for soft coal—railroads, the coke plants, the Northwest trade—all reported gains in May over the previous month. Overseas exports are on the decline.

Demand was practically at a standstill in the Middle West, but prices held steady. Production in Illinois and in Indiana has been reduced to a point where some producers bought coal to fulfill their own contracts. In New England, buying except in small lots is almost negligible, due in part to an easing up in the cotton industry.



Shipments from Baltimore during the first ten days

of June amounted to 106,860 tons of cargo and bunker coal in fourteen steamers and one schooner, as compared with 107,719 tons of cargo and bunker coal in fourteen steamers during the corresponding period of May.

"Preliminary estimates of soft coal produced in the week ended June 9," says the Geological Survey, "indicate a total, including coal coked, lignite and mine fuel, of 10,708,000 net tons, an increase of 617,000 tons over the revised estimate for the week preceding.

"Early returns on car loadings during the week June

Estimates of Production

(Net Tons)

BITUMINOUS

	1922	1923
May 26	4,889,000	11,049,000
June 2 (*b*)	4,616,000	10,091,000
June 9 (*a*)	5,136,000	10,708,000
Daily average	856,000	1,785,000
Calendar year	172,248,000	241,850,000
Daily av. cal. year	1,266,000	1,778,000

ANTHRACITE

May 26	10,000	1,956,000
June 2	8,000	1,606,000

(*a*) Subject to revision. (*b*) Revised from last report

11-16 indicate a slight increase in the rate of production and a probable total output for the week of 10,800,000 tons."

Total dumpings of bituminous coal over Lake Erie piers from the opening of Lake navigation to June 10 was 6,841,488 net tons, as compared with 6,903,274 tons in the corresponding period of 1921, says the Geological Survey. Shipments of anthracite from Buffalo during the week ended June 12 was 98,400 net tons, as compared with 84,700 tons the previous week. The cumulative shipments this season to June 12, inclusive, were 715,620 tons. In the corresponding period of 1922 only 19,500 tons had been moved, but in 1921 the total to corresponding date was 1,023,000 tons. Dumping at Hampton Roads for all accounts during the week ended June 14 was 282,706 net tons, as compared with 356,349 net tons the previous week.

There is a growing demand for anthracite, especially in the larger sizes. Egg and stove continue to grow scarcer in some sections, with chestnut size becoming stronger in demand. Buckwheat is the easiest of the steam coals.

Chicago Market at Low Ebb

Trade in all coals was at the bottom of the Chicago market during the past week. Domestic—even the best southern Illinois lump—was in no demand whatever and naturally every other Western domestic also was at a standstill. Prices were not shaken, however. Association operators stuck to $4.35 for Franklin County prepared sizes and independents continued to get varying amounts down to $3.25. Since there is no domestic stocking of anything but anthracite and a little coke and smokeless, about all the lump made in Illinois and Indiana went into railroad stockpiles. The only steam movement to speak of through this market was coal for immediate consumption.

The market generally is so low that shutdowns have reduced the Illinois and Indiana output to a point where several producers have been buying coal to fulfill their own contracts. Much sales activity is centered in the Northwest. The flow of Pocahontas and hard coal into the Chicago territory continues steadily with a reasonably brisk trade in the latter. As for the former, some operators were glad to see the Sandusky embargo slapped on a few days ago to restrict

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 210, Week of June 18, 1923. Average spot price for same period, $2.54. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

the recent easy flow of smokeless to this territory. It was becoming difficult to maintain a price of $4 on mine-run and $6@$6.25 on lump.

Illinois Fields Inactive

The situation in southern Illinois during the week shows a further slowing up on all sizes. The easing up on domestic sizes, however, has caused a better movement of the steam sizes that had been available, but this is nothing like what it should be under present conditions. All mines have unbilled coal on track. No 1 nut and egg seem to be the hardest to move.

A little railroad coal is moving out of the Mt. Olive district, but practically nothing in the way of steam or domestic. In the Standard district working time seems to be getting uniformly less. Railroad tonnage dropped off the past week and every mine seems to have "no bills." Some mines have not worked for five weeks and still have unbilled coal on track.

There is practically no domestic moving in St. Louis and the little that is coming in seems to be anthracite or coke, but even the coke tonnage has dropped off. Local wagon-load steam has practically stopped but a little movement of cheap coal is coming in for apartment-house storage. Local carload steam is easy, with no steam demand from the country at all. Domestic business in the country has dropped off the same as in the city and the dealer trade generally has a pretty fair supply on hand.

Louisville Is Not Downhearted

While there is a good deal of complaint heard among Louisville coal offices over the difficulty of selling coal the general movement from the mines continues quite fair. Competition for business is very keen. Movement to the Lakes is showing a little improvement, it is said, and there is a slightly better inquiry from utilities, municipal plants, etc.

Western Kentucky mines have been having a little more distress coal on the market than usual, and this is causing complaint among some of the operators as well as jobbers, as the weak prices quoted on distress fuel makes it a hard market in which to sell coal at the mine.

Minneapolis Hard After Anthracite

The hard-coal demand at Minneapolis has been materially better this spring. Receipts at the docks have been encouraging and people appear to be remembering last year's shortage. Soft-coal buyers are more inclined to hold back. They did not have any serious experience during last winter. They propose to get lower prices and are stimulated in their efforts by the volume of demurrage stuff they have been picking up lately.

A sudden demand for screenings at Duluth has featured a market which is otherwise dead. Several industrial concerns are in the market and it looks as if large lots of screenings will move soon. One concern using more than 300,000 tons of screenings yearly has signified its intention of placing its orders for dock coal. This concern has always used Illinois coal till now. Shipments are duller than at this time last month, which is causing some anxiety among the dock men. Buyers want lower prices.

Absolute quiet prevails in the Milwaukee coal market in spite of hard work by jobbers and retailers. Nine out of ten consumers consider coal too high. Coke is in the same category and byproduct companies are finding a slow sale for their outputs. Car ferries brought 30,636 tons of anthracite, and 48,242 tons of soft coal during May. The May rail movement was confined to 50,428 tons of soft coal.

Nothing has happened in the last week to lift the gloom which settled down on the Kansas district last winter and which has been growing heavier ever since.

Utah Trade Is More Active

Utah production is now estimated to be 60 per cent of full-time capacity, a big jump in the past 10 days. Industrials such as smelters, copper companies, sugar companies and others are buying now. The contract price averages $1.50@$1.25. Railroads are not buying much. They have plenty of coal on hand. Domestic business is improving, but so far consumers have shown no disposition to rush the dealers. General Sales Manager Calvin of the United States Fuel Co. said he expected August to be the biggest month of the year because the car supply will be excellent. The beet crop will not have started to move. September, October and November, he thought, would see less activity in the coal industry.

There is a big shortage in Colorado lignite slack on account of the limited domestic business. This fuel is selling at $1.80, an advance from $1.25 two weeks ago. First-grade lump is $3.50, second grade, $2.75, mine-run, $2.25@$2.75.

Demand Quiet in Ohio Markets

Columbus, Ohio, reports no trouble from car shortage, but there is a lack of demand for coal reported from practically every section in which Ohio-mined coal sells. Domestic demand has fallen off and the steam trade is easier. Buying on the part of nearly all consumers in the Columbus territory is for immediate needs. Steam users are buying in the open market rather than entering into contracts. Demand in the Cleveland market is quiet and some mines in adjacent mining districts have closed down because of the situation. Mines in No. 8 district have been kept busy up to this time producing railroad fuel and coal for lake shipment.

There has been a return of confidence in the smokeless coal situation at Cincinnati following reports of much distress coal in the Chicago market. The market for block and 4-in. lump is listless. Standard coals held up pretty well. Quotations for West Virginia 2-in. lump at Cincinnati on June 18 were $2.75@$3 as compared with $2.50@$3 the previous week, and for southeastern Kentucky 2-in. lump $2.50@$3 as compared with $2.50@$2.75.

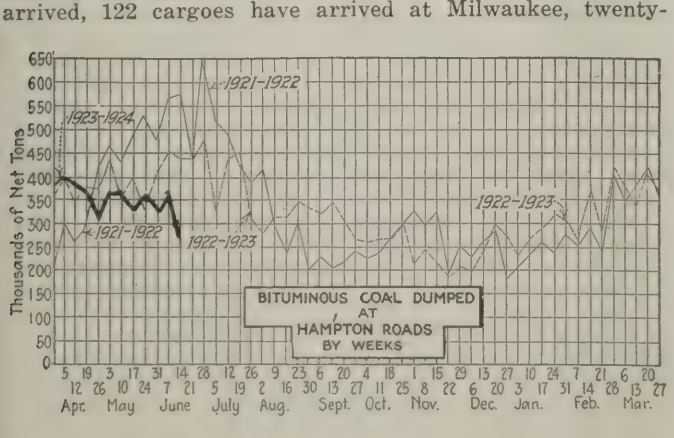
With ample car and labor supplies, production of coal in the Pittsburgh district moved up so easily and smoothly that the increase in demand is not fully realized.

Buying Negligible in New England

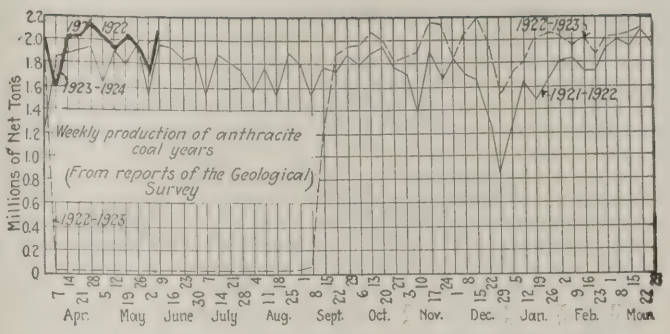
Cotton manufacturers in New England to a considerable number have curtailed production from a third to a half and there are enough other industries so nearly in the same position that except for scattering small lots buying is almost negligible. Reduced prices on the Southern coal have removed the inducement for buying high grades all-rail from central Pennsylvania in a widening area.

Sales of Pocahontas and New River are very light. Operators have been obliged to slow down production to avoid carrying large tonnages on cars at the piers, and prices have shown a further decline as compared with a week ago. No. 1 Navy standard coal sold down to $5.75 per gross ton, f.o.b. vessel, with shippers of No. 2 coals and the high volatiles actively soliciting offers. At Boston for inland delivery also the price level has dropped and where a month ago quotations were firmer at $8.25 per gross ton on cars they have now receded to $7.50 and less.

All-rail prices remain practically unchanged. The hardening tendency noticed a few weeks ago, especially on the choice coals, is now eliminated, and the agencies that did not then improve the opportunity to tie up business are beginning to feel the effects of the dull market. No. 1 coals have sold down to $3.25 and $3 per ton at the mines, and new consignments are not readily obtained.



Spotty Tendency in New York Market



The New York market is spotty, sales depending principally on the prices quoted and the buyer's needs. Some shippers believe the bottom in prices has been reached but they do not look for any substantial increase in either prices or demand until the latter part of August or early in September. In the meantime the situation may be affected by the anthracite wage negotiations.

Consumers in the Philadelphia market appear to be taking slightly more interest in the situation and it is believed that some quiet contracting has been going on, principally on the initiative of the consumer.

Inquiries for commercial coal in the Birmingham (Ala.) market is practically at a standstill. Inquiries, which are few, are for small tonnages. The feature of last week's market was the closing of contracts for supplying the Southern Railway system for the next twelve months, 1,250,000 tons being involved, which is about the same as was required last year.

Of the sixty-two cargoes of coal arriving at Duluth last week, five of them were anthracite. It is reported that twenty-five more, of which four are anthracite, are on their way. It was estimated that on June 1 stocks on the docks amounted to 1,750,000 tons of bituminous coal and 150,000 tons of anthracite. Since May 3, when the first cargo arrived, 122 cargoes have arrived at Milwaukee, twenty-

seven carrying 216,119 tons of anthracite and ninety-five carrying 780,889 tons of soft coal. Dumpings at Lake ports during the week ended June 18 were 1,020,176 net tons of cargo coal and 54,667 net tons of fuel coal, making dumpings for the season 7,391,956 tons of cargo coal and 342,765 tons of fuel coal.

Domestic Users Watch Anthracite Situation

Consumers of the domestic sizes of anthracite are closely watching the situation in the coal fields. They are becoming more insistent concerning deliveries and some are already putting substitutes, principally coke, into their bins. In the New York market there has been a slightly increased demand for broken coal to take the place of either egg or stove, both of which are short. Chestnut coal is stronger. The upper region steam coals are in better demand than those from the Southern fields.

Stove coal is short in the Philadelphia market and some retail dealers have advanced their prices for this size in an effort to relieve the situation. Retail dealers are urging shippers for more coal. Slow shipments to Baltimore make it difficult for retail dealers there to fill orders.

"During the week ended June 9 the rate of production of anthracite recovered from the holiday slump," says the Geological Survey. "The total output is estimated at 2,046,000 net tons, including mine fuel, local sales, and product of washeries and dredges."

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

Foreign Market And Export News

British Coal Output Rebounds Sharply; Quotations Show Decline

Output of coal in Great Britain's mines during the week ended June 2 totaled 5,727,000 tons, says a cable to *Coal Age*, an increase of 1,990,000 tons over the production of the previous week. Prices continue on the downward grade, with demand for immediate shipments easier.

Buyers in the Welsh markets are holding off in the hope of lower prices, but, owing to heavy orders waiting fulfillment the strength of the market is well sustained. The decline in output over the holidays is reflected in a scarcity of superior grade coals for prompt shipment.

Beyond this month the outlook is less satisfactory, and middlemen holding contracts made when prices were very much lower are inclined to undersell the mines.

The market in the north of England is quieter and also somewhat weaker. The German demand is not so insistent, and labor troubles have obstructed dealings with Belgium, Holland and Dunkirk. The result is an accumulation of coal-laden steamers and an interruption of the steady flow of business. France is buying very cautiously. The mines are sold heavily over this month.

French Coal Situation

Coal supplies in Paris are somewhat depleted because of the strike of Belgian railway employees, but with the men back at work it is expected there will be no further trouble. However, some additional trouble is expected in the Sarre coal fields where the mine officials have put forward the following "revendications": Increase of wages, speedier promotion, extension of annual leave, and constitution of a committee to represent the officials' interests with the management.

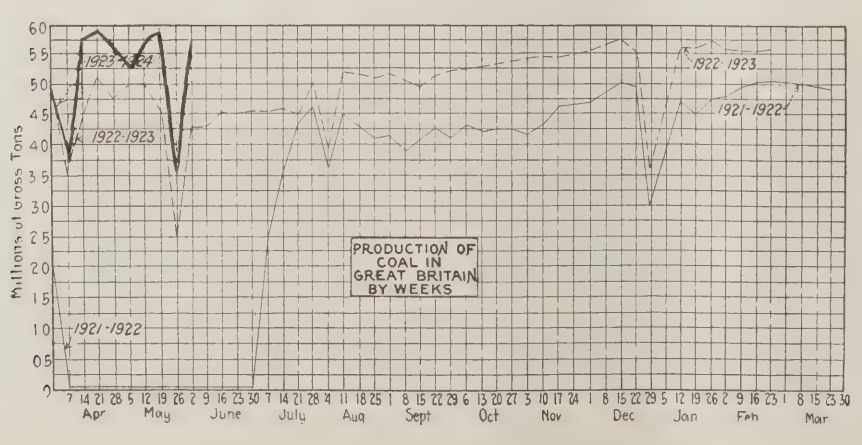
Coke is being received by the Société des Cokes de Hauts-Fourneaux from the Ruhr at a daily average of about 5,000 tons. American coke continues to arrive, but it is very different from the coke usually used in French blast furnaces. Because of this French metallurgical concerns are making special investigations as to the best means of utilizing it. Some concerns are using it to the extent of 40 per cent as a component part of special coke mixtures, while others use about 15 per cent of it in their furnaces.

Production of French collieries during March and April, in metric tons, follows:

	COAL		
March.....	3,012,116	April.....	2,999,617
	COKE		
March.....	149,285	April.....	156,035
	BRIQUETS		
March.....	262,316	April.....	214,342

One reason given for heavier production of coal and briquets in March is that there were 27 working days in that month as compared with 24 in April.

Dullness Affects Hampton Roads Market



Business slackened at Hampton Roads last week with the customary summer dullness settling over the market. Embargoes on coal to the Great Lakes slowed up coastwise shipments, while all branches of the trade were light.

Decline in prices continued, and buyers were not eager to come into the market under the circumstances. Few contracts were being made, and shippers reported inquiries very rare.

Domestic dealers, in some instances, were making contracts on the most favorable basis in the last twelve months. Export business held fairly firm, but no new contracts in this trade were evident.

German Coal Prices Advance

An increase of 53 per cent was made in the price of coal throughout Germany to take effect June 1, according to an announcement made at Berlin. The advance was made in consequence of the further depreciation of the mark and an increase in wages granted the miners. The increase will make Ruhr coal cost 221,000 marks a ton, as compared with about 437,000 marks a ton for English coal delivered at Hamburg.

News Items From Field and Trade

ALABAMA

Announcement is made that the **Pratt Fuel Co. has purchased the properties of the Dora Fuel Co. and Kershaw Mining Co.**, at Dora, Walker County. Frank Marquis, president of the Dora Fuel Co. and John Stone, of the Kershaw Mining Co., will be officials of the consolidated companies, of which Waler Moore will be president.

COLORADO

Work on the Moffatt tunnel in Colorado is to be started within a month. The ruling of the U. S. Supreme Court during the past week that the Colorado law is constitutional providing for the construction of the Moffat tunnel, clears the way, the tunnel commission has announced. In Moffat and Routt countries, it is estimated by state engineers, there are 79,349 acres of coal lands which have an estimated future production of coal from workable beds of 2,014,740,253 tons. In addition, there are 99,488 acres in the two counties which should, at the lowest estimate, yield 99,488,000 tons. The project also will open up valuable oil and oil shale lands. Friends of the tunnel project assert that it means to Denver and Colorado what the immense harbors at San Francisco and New York city mean to those cities. Opponents declare the others are too optimistic, that the coal market will not absorb the Routt County output and that the southern Colorado coal fields will suffer keenly.

ILLINOIS

Thirty thousand dollars of the Herrin defence fund has been returned to the donors. Originally $60,000 was collected from business men of Illinois through the State Chamber of Commerce to support the prosecution of the case by the state Attorney General's office afte it became known that state funds were insufficient.

Bids for furnishing and delivering bituminous coal to Illinois charitable, penal and reformatory institutions and the state normal schools **have been requested** by the State Department of Public Works, Division of Purchases and Supplies, for the period from July 1, 1923, up to and including June 30, 1924. Bids will be received up to 10 P. M., June 25.

Two hundred miners or more are expected to compete in the state mine rescue contest to be held at Collinsville, June 23. Medals will be given all contestants and loving cups will be presented to the winning teams. Over thirty teams have already been entered in the event and three or more winning teams will be sent to the international first-aid contest at Salt Lake City.

Tests are being made and plans formed for the opening of **a new mine between St. Johns and Du Quoin** in the future. In all probability the mine will be a stripping operation. Work is being carried on by men connected in a way with the Majestic Coal & Coke Co., of Du Quoin, and it is thought that that company is back of the present plans, although no official announcement has been given by that company.

The Reynolds Coal & Fuel Mining Co., Loami, has been incorporated with a capital of $14,000, to mine and deal in coal; incorporators, C. M Reynolds, L. D. Reynolds, John R. Reynolds; correspondent, Ed. D. Henry, 508 Myers Building, Springfield.

M. M. Leighton has been appointed chief of the Illinois Geological Survey at Urbana, succeeding F. W. DeWolfe, who resigned last spring. During the interim Harold E. Culver was acting chief.

The Dering Coal Co. is building the two-and-a-half-mile railroad now being constructed from a Dering mine near Eldorado to a connection with the Big Four near Wasson. It was erroneously reported that the Illinois Central R.R. was building it. Illinois Central engineers laid it out but the line belongs to the Dering company. It is not yet determined whether the short road will be operated by the Big Four or by the Dering company.

A new coal mine with anticipated production of 300 tons will be opened on the Toledo, Peoria & Western R.R. west of Civer, a village near Canton. The firm of McGlaughlin Bros. has leased about 400 acres of coal lands. They have been engaged for fifteen years in the coal business in Canton.

A bill for accounting, for receivership and for an injunction has been filed in the St. Clair County Circuit Court by Elmer H., Michael H., and Robert C. Wright, of Belleville, Ill., against the Red River Coal Co., J. A. Knebel and A. W. Sieglaff. The corporation was formed in 1922, the capital stock being $150,000, of which $100,000 was common and $50,000 preferred. Elmer H. Wright, J. A. Knebel and A. W. Seiglaff were named directors.

No. 2 mine at Du Quoin, formerly operated by the Old Abe Mining Co., of that city, and the output of which was sold through the Kanawha Fuel Co., Milwaukee, **has been taken over by J. M. Mitchell,** coal operator of Royalton. The new owner of the shaft has sent an engineer to the mine and a force of men have been put to work cleaning up ready for operation. This mine was closed down over a year ago, and while much of the machinery and equipment was left in the plant, quite an amount of new installation will be made.

INDIANA

The Bloomington Block Coal Co., Bloomington, has been chartered with a capital of $20,000; directors, John S. Risher, Helen T. Risher and Ina R. Irvine.

A cave-in of the seventh southwest entry of **Francisco No. 1 mine,** involving an area of about 200 sq.ft. underground, caused the sinking of earth under the main line tracks of the Southern Ry. near Princeton, Ind., recently. The sunken area at the surface was 100 ft. square. No further spread of the cave is expected.

The Board of Trustees of Indiana University, at Bloomington, Ind., is receiving bids for the installation of coal- and ash-handling equipment to be used in connection with the new power house there. The board also is seeking bids on a large traveling crane. Bids will close June 22. Charles R. Ammerman, 520 Occidental building, Indianapolis, is the engineer in charge of the work.

IOWA

The Northwestern Coal Co., of Albia, has five prospect drills at work in the Coal Glen neighborhood near Columbia. This is the second visit of the drillers to that locality. They drilled each 40-acre tract upon which they had prospect rights. The present intention is thoroughly to prospect every ten-acre tract.

KANSAS

The Capital Coal & Mining Co., of Topeka, with an authorized capitalization of $200,000, has been incorporated by the following, all of Topeka: O. M. Lyons, F. L. Loveless, Fred D. Coffman, Florence G. Coffman and John E. Barrett. Mr. Barrett is Governor Davis' choice for state oil inspector and now has a suit pending in the State Supreme Court to try to oust Hugh Duff, Republican, appointed to the position by Governor Allen.

KENTUCKY

The Kentucky Block Coal Co., of Lexington, is reported to have purchased hard wood timber lands near Whitesburg.

The St. Mihiel Coal Co., McCreary, has increased its capital stock from $25,000 to $40,000.

Numerous improvements are being made by the Chesapeake & Ohio Ry. in the Big Sandy District of Kentucky. When such improvements to trackage and yard increases are completed it will be possible for the road to handle approximately 1,200 cars per day instead of about 300 per day, as under present facilities.

LOUISIANA

The District Engineer, 140 Decatur St., New Orleans, will soon let contract for 5,000 tons bituminous coal for shipment to Natchez, Miss., and 1,500 tons for shipment to New Orleans, for flood control works.

NEW YORK

Burns Brothers stockholders at their annual meeting June 14 in Jersey City **voted in favor of the recapitalization plan** submitted by a special committee of directors. The plan as approved calls for the retirement of both issues of preferred stock, the conversion of the Class A common stock into preferred stock of the recapitalized company and conversion of the Class B stock into common stock of the recapitalized company. One share of common stock of the new company will be given with each share of Class A common, also the right to subscribe to one additional share. The right to subscribe to one additional share of common stock also will be given to present Class B common stockholders.

For probably the first time **the Board of Purchase of the City of New York received proposals** on June 12 for furnishing and delivering to various points in the five Boroughs 29,121 tons of briquets as a substitute for egg, stove and chestnut coals "in so far as the department's requirements permit." The specifications provide that the briquets shall show on analysis maximum moisture 3 per cent as delivered; maximum ash, 16.5 per cent dry coal; minimum B.t.u., 12,400; maximum volatile combustible matter, 9 per cent. The proposals called for 245,076 net tons of anthracite; 73,621 tons bituminous run of mine coal; 65,800 tons mixed coal; and 103 tons George's Creek. Deliveries are to be for the period July 1, 1923, to March 31, 1924. Bids for furnishing and delivering 12,165 tons of briquets in Manhattan ranged from $11.03 to $13.20 per ton; for 9,239 tons in Brooklyn, and 2,682 tons in Queens, $11.03 to $11.95; for 4,266 tons in the Bronx, $11.03 to $11.65 and for 779 tons in Richmond, $11.12 to $13.03. Bids received for furnishing and delivering domestic sizes of athracite in the various boroughs ranged as follows: Manhattan—Egg, stove and chestnut, $13.75 to $16, pea coal $9.94 to $12. Brooklyn—Egg, $13.61 to $15.50, stove and chestnut sizes $13.50 to $15.50 and pea, $9.94 to $10.38. Queens—Egg stove and chestnut, $14.55 to $15.50. The Bronx—Egg, stove and chestnut sizes, $14.50 to $16. Other bids received for Manhattan deliveries included the following: 9,000 tons mixed coal, 75 per cent No. 3 buckwheat and 25 per cent soft coal, $5.34 to $5.79; 6,280 tons No. 2 buckwheat, $5.69 to $6.03, and 2,056 tons soft coal, run of mine, $6.64 to $8.28.

For Brooklyn deliveries the proposals received included the following: 7,400 tons No. 1 buckwheat, $5.19 to $6.07; and 14,600 tons mixed coal (12,950 tons No. 2 buckwheat and 3,650 tons soft coal), $5.60 to $6.39. For furnishing and delivering 12,065 tons No. 1 buckwheat in Queens borough the bids ranged from $5.51 to $7.42. For furnishing 9,225 tons of run of mine to boats of the various city departments the bids ranged from $6.96 to $7.20.

Proposals calling for barge deliveries to various points included the following: 113,520 tons No. 1 buckwheat, $5.08 to $6.41; 8,000 tons No. 2 buckwheat, $4.78 to $5.79; 40,000 tons No. 3 buckwheat, $3.60 to $4.29; 32,066 tons run of mine, $5.44 to $6.48; 19,200 tons mixed (6,900 tons soft coal, 4,200 tons No. 3 buckwheat and 8,100 tons No 2 buckwheat) $4.71 to $6.03; 400 tons egg coal, $11.42 to $13.75; 748 tons stove coal, $15, and 350 tons coke, $10.59 to $13.20.

For furnishing and delivering to various institutions in Orange County New York, to watersheds the following bids were among those received: stove and chestnut coal, $13.50 to $16; No. 3 buckwheat, $3.60 to $3.62; and run of mine, $5.61 to $5.78. Bids received for furnishing in car load deliveries 8,550 tons soft coal, run of mine, for Brooklyn watersheds outside the city limits on Long Island ranged from $5.76 to $6.60, and for furnishing and delivering in carload lots to the Ridgewood Brooklyn, pumping station, 15,650 tons soft coal, run of mine, $5.65 to $6.33.

OHIO

The following coal companies were incorporated in this state recently: **The Long Hill Coal Co.**, Nelsonville; capital, $25,000; L. J. Eberle, R. S. Oxley, A. H. Schory, O. P. Amann and M. E. Voll. **The Zanesville Coal Co.**, Zanesville; capital, $200,000; S.

H. Carrick, C. W. Howell, E. F. O'Neal, C. L. Truesdell and H. C. Pugh. **The Terminal Fuel Co.**, Cleveland; capital, $25,000; Arthur B. Ragon, L. A. Ragon, C. E. Cline, Fay S. Zimmerman and H. L. Smith. **The Blue Flame Coal Co.**, New Lexington; $25,000; Sheldon Kinsel, R. W. Murray, Raymond Diller, T. M. Potter and Thomas Ward.

The Ernst Coal Co. and the Sandford Coal Co. have merged, with offices at 1201 Public Square, Marion; capital, $1,500,000; incorporators, H. J. Meehan, John C. Cosgrove, R. B. Mitchell.

The Kensington Coal Co., Youngstown, has increased its capital from $40,000 to $75,000, and the **Battle Axe Coal Co.**, Massilon, from $10,000 to $100,000.

The U. S. Court of Appeals at Cincinnati **denied the petition of Sherman Everett, trading as the Western Coal Co., for a rehearing** of the case in which the Emmons Coal Mining Co. of Philadelphia and Charleston, W. Va., obtained a verdict for about $16,000 because of the violation of a contract for the delivery of coal some three or four years ago.

OKLAHOMA

Local Union No. 719, United Mine Workers, at Henryetta, has filed suit in the Superior Court of Logan County **seeking receivership for the Monarch Coal Co.**, which has been operating mines at Kuss. Plaintiffs allege in their petition that the defendant company is in debt to various coal miners, members of the local, in sums ranging from $10 to $80, such indebtedness aggregating a total of $470, and ask that a receiver be appointed to conduct the affairs of the company until these claims are paid.

The Mammoth Vein Colliery Co. has been incorporated in Muskogee, with a capital of $10,000, by T. H. Niles, Muskogee, and J. G. Puterbaugh and E. P. Joyner, of McAlester.

PENNSYLVANIA

Net income of the Pennsylvania Coal & Coke Corporation for the first four months of 1923 totaled $469,612, before federal tax deductions, which was equal to $2.71 a share on 172,606 shares of $50 par. This is equivalent to slightly more than 16 per cent income annually.

Mrs. Charles F. Huber, wife of the president and general manager of the Lehigh & Wilkes-Barre Coal Co., and her chauffeur, Oliver Gibbons, were so **badly burned by an explosion of gasoline** at her home in Wilkes-Barre, June 12, that **both died** a few hours later. She was prominent socially and a leader in civic affairs.

The House Mines and Mining Committee at Harrisburg took **favorable action** June 6 **on the Clarke Senate bill exempting mine inspectors from furnishing surety bonds** and permitting the chief of the Bureau of Mines to designate the number of days the members of the miners' inspectors examining boards shall be paid for their services.

After passing the Senate by a vote of 35 to 11, **the Joyce Compensation Bill**, which provides increases in workmen's compensation rates from $12 to $15 per week, **was defeated in the House** by 94 to 85. It required 105 votes to send it to the Governor. An effort may be made to get the House to reconsider its action.

Three mine workers were burned June 13 in an explosion of gas in the Henry Colliery of the Lehigh Valley Coal Co. at Plains. The explosion occurred shortly before noon in the Red Ash vein. It knocked over some timber and ventilation equipment but no other damage was caused to the mine property.

Mine Inspector W. T. Williams at Scranton says that **over 100 mine workers in the territory between Peckville and Avoca have qualified for the positions of foreman and assistant foreman.** The examination was held in the Board of Trade building May 1. The names of those who passed have been forwarded to Harrisburg for approval of Joseph J. Walsh, chief of the mine bureau. It was one of the largest single classes to qualify since the certificate law was enacted.

Mining operations were resumed June 12 in No. 28 slope of the Dorrance colliery, where a fire raged for two weeks. John M. Humphrey, president of the Lehigh & Wilkes-Barre, announced that all trace of fire had disappeared. He said reopening of the slope would give employment to approximately 100 men. Mr. Humphrey also said that a fire which started from an explosion June 11, resulting in burns to two men, was extinguished within a short time. When the flames were first discovered thousands of feet of hose were immediately rushed into the mine.

The House at Harrisburg on Monday evening, June 11, passed finally the Davis-Fowler mine-cave bills, which provide that 12½ per cent. of the anthracite tax collected by the state be returned to the anthracite counties. One-half of this sum is to go to the Anthracite Mine-Cave Fund for protection against mine caves and the other half to the Anthracite Municipalities Fund for municipal improvements. Each of the bills creates one of the commissions. Representative Fowler explained the bills and there was no debate. Governor Pinchot has gone on record as saying that unless the Legislature provided other revenues the state could not afford to divide the anthracite tax among the counties. Both Senate and House having passed the bills, the question of their signature is now up to him.

To compel the employment of a man for eight hours to do half an hour's work, **employees at New Castle colliery of the Replier Coal Co., Minersville, are on strike** and the colliery is idle. Men working in the separator at the colliery demanded that the company employ a man for a full day to oil the machinery. The oiling requires fifteen minutes of a man's time twice a day and had been done by one of the regular employees. This man objected to doing two jobs and the matter was taken up with the mine grievance committee, which agreed that the demand of the separator men was absurd. The matter apparently was settled, but the employees, after working ten minutes, decided to strike until the company complied with their demand.

Shipments of anthracite during the month of May, 1923, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,564,285 gross tons, as compared with 6,173,774 gross tons during the preceding month of April, an increase of 390,511 tons, or 6.3 per cent. Comparing the shipments of May this year with the same month in 1921, an increase of 770,390 tons is recorded, or 13.3 per cent. The shipment of prepared sizes last month established a record for May, and was only approached during the month of May in the years 1917 and 1918, when the maximum production was reached. Shipments by originating carriers were as follows:

	May 1923	April 1923
Phila. & Reading	1,152,026	1,170,925
Lehigh Valley	1,150,037	1,088,782
Central R.R. of N. J.	538,386	508,683
Del., Lack. & Western	985,035	906,203
Delaware & Hudson	892,471	851,960
Pennsylvania	618,096	527,139
Erie	721,756	647,707
N. Y., Ont., & Western	159,043	146,985
Lehigh & New England	347,435	325,389
Totals	6,564,285	6,173,774

SOUTH DAKOTA

A. O. Ringsrud, president of the **South Dakota Board of Charities and Corrections has been authorized to canvass for bids on coal for various state institutions.** The state penal and charitable institutions used about 18,000 tons of lignite last year and expect to use about the same amount this year and a supplementary amount will be needed. The report of State Heating Engineer Radcliff recommended the use of lignite from the state mine at $2.50 a ton at the mine for the majority of the institutions, supplemented by screenings. Iowa coal is found cheaper for the state hospital and Wyoming coal for the Custer sanitarium. The Redfield school uses lignite.

TENNESSEE

The Putnam Mining Co., of Cookeville, has been incorporated with a capital of $50,000 and will develop a coal mine near Monterey. O. K. Holladay is president and H. S. Hargis is secretary and treasurer.

Nine barges of coal being towed on the Mississippi River by the steamer Charles F. Richardson, of the West Kentucky Coal Co. and destined to Vicksburg, Miss., are reported as having sunk when the cargo encountered a rain and wind storm a short distance north of Memphis, June 7. The estimated value of the barges and coal was given at $60,000.

TEXAS

H. L. Mills, business manager of public schools, Houston, is in the market for 1,200 tons of lump coal to be distributed to various school houses.

A bill levying a 2 per cent tax on production of coal and lignite in Texas has been reported favorably by a Senate committee of the third called session of the Thirty-eighth Legislature now in session at Austin. The tax on lignite and coal mined in this state was added to the bill as it passed the House, a committee substitute levying the production tax of 2 per cent on eleven other articles. The House bill proposed only to levy the tax on sulphur and turpentine. It is declared that the proposed tax on coal and lignite will result in the death of the bill in the Senate.

UTAH

The Utah Railway is spending $100,000 in Spring Canyon **cementing two of its tunnels between Hiawatha and Martin.** These tunnels have been giving considerable trouble.

The State Industrial Commission is investigating allegations made by two men that they were sent here by an Illinois employment agency and assured work in Utah coal mines only to find men were being turned away.

The Utah Central Coal Co. has been incorporated at Ogden with a capital of $500,000 in shares of par value of $100 each. M. S. Browning is president; E. S. Rolapp, vice-president; John Browning, secretary and treasurer. The company's property is in Carbon County.

A story comes from southern Utah about an Easterner named Buckner, who 40 years ago invested some of his small savings in a Utah coal mine, later coming West himself. The coal mine in a short time was regarded as a gold brick and forgotten. Last winter Buckner's feet were badly frozen and a few weks ago his legs became infected and he died. Just before he died relatives announced that his coal stock had taken a jump and was worth $50,000.

WEST VIRGINIA

The Searles Coal Co. has been organized by Charleston capitalists for the purpose of engaging in the coal business in the Kanawha field, with a capital stock of $50,000. Principally interested in the new company are: S. W. Searles, E. E. Searles, F. W. Field, E. A. Field and R. W. Burton, all of Charleston.

The West Virginia-Great Lakes Coal Corporation has been organized with a capital stock of $500,000 by some of those prominent in coal circles in northern West Virginia and with a view to producing and marketing northern West Virginia coal on a large scale, principally at piers on the Great Lakes. Fairmont is to be the general office of the company. Among those largely interested in this company are: James Edwin Gaskill, C. E. Gaskill, M. L. Gaskill, E. M. Hill and E. M. Watkins, all of Fairmont.

The Sterling Black Mining Co. has been incorporated with 1,000 shares of no-par value, the seat of operation to be at or near Altman, in Boone County. Among those interested in the new enterprise are G. W. Coyle, of Columbus, Ohio; Sam Brown, of Pittsburgh, Pa.; T. L. Johnson, Frank Kerns and I. F. Somerville, of Charleston.

The Morrison Coal Co. is engaged in opening a large mine for the purpose of operating on a large scale in Wyoming County, where this company has a large acreage under lease. At the present rate of construction progress, the company will be able to operate late in the year. The Morrison company is headed by John Laing, of Charleston.

The New River Co., the largest concern operating in the New River field, produced a total of 600,000 tons during the months of January, February, March and April, production for April amounting to 154,000 tons or about 20,000 tons less than for March. During the first four months of the year the New River company had declared $4.50 a share in dividends, or $330,546 in all on its 73,477 shares of preferred stock.

Extensive improvements are under way at the plants of the **Brady Warner Coal Corporation** at Brady, in Monongalia County, and at its Abrams Creek mine at Oakmont, in Mineral County. At Brady the company has built a wooden tipple with loading booms, has installed two rotary dumps, and has laid 65-lb. rail along the haulageway. The company has also purchased 100 new 4½-ton steel mine cars. When improvements are completed, the two

mines at Brady will have a capacity of 4,000 tons a day. At the Oakmont mine 65-lb. steel rails are being laid and a substation is being constructed. It is planned to equip the plant with a 24-ft. picking table, rotary dump and button conveyor, the latter being installed by the Fairmont Mining Machinery Co. At this plant also 100 new 3½-ton steel mine cars have been added.

Construction work is under way on **a tipple for the Brown No. 1 mine of the Fairmont-West Virginia Gas Coal Co.** on the Wyatt branch of the Western Maryland Ry. in the Marion County field. Robert L. Brown and associates are largely interested in the company. The tipple will have a loading capacity of from 1,000 to 1,250 tons of coal a day. Construction work is progressing also on an adequate siding.

A fall of slate which loosened a trolley wire in the Jamison No. 7 mine of the Bethlehem Mines Corporation near Barrackville, in Marion County, on June 11 is thought to have been the indirect cause of a mine fire which baffled the efforts of fire fighters for the better part of a day and a half, though it did little damage. The mines resumed operations after the loss of only two or three days.

Under a decision of the West Virginia Supreme Court of Appeals handed down June 12 was held that miners at an operation where the "Washington agreement" of 1917, providing for increased wages and an increase in the fixed price of coal, was not in effect had no ground for claiming a share in any increased price of coal received by the operator after that agreement. The decision was in connection with a decree affirming the decision of the Circuit Court of McDowell County in the case of N. M. Brown and others against the Bottom Creek Coal & Coke Co. Brown and thirty-three other employees of the company sued that concern, alleging that after the Washington agreement in October, 1917, the company received an increase of 45c. a ton over the price fixed by the Coal Administrator in August, 1917, but that the miners received no increase in wages. The miners asked for an accounting of the tons of coal they had mined, the price received for it and distribution of what they claimed was a trust fund automatically created by reason of the increased price.

WASHINGTON

A miner was killed early in May by a fall of loose coal in the Hiawatha Coal Co.'s mine near Durham. The mine had been reopened after a shut-down of three years.

WISCONSIN

The Berwind Fuel Co. is completing a concrete floor on its Dock No. 1 at Superior. Screenings will be stored on the dock.

The B. F. Sturtevant Co., of Hyde Park, Mass., **has purchased the plant of the Wisconsin Engine Co.**, at Corliss. The new acquisition covers nearly ten acres and the buildings have approximately 150,000 sq.ft. of floor space.

J. W. Gorby, of the Cyclone Fence Co., Waukegan, Ill., told the members of the Junior Association of Commerce at Milwaukee recently that **Milwaukee and the entire lower basin of Lake Michigan is the center of the greatest deposits of coal and iron of the country.**

William Wilshire, president; **W. H. Goodwin**, vice-president, and **J. T. Stoneroad, of the Carnegie Dock & Coal Co.**, have made a tour of inspection of the company's properties at the Head-of-the-Lakes. They expressed themselves as well pleased with the outlook, and said that the prospective adjustment would settle the rate dispute now going on.

WASHINGTON, D. C.

Robert E. Quirk, who recently resigned as chief examiner of the Interstate Commerce Commission, has formed a partnership with J. VanDyke Norman and George F. Graham for the general practice of law. The firm name will be Norman, Quirk & Graham and will have offices in the Woodward Building, Washington, D. C., and the Inter-Southern Building, Louisville, Ky.

Two cases involving questions of evaluation of a public utility for rate-making purposes were decided by the U. S. Supreme Court June 11. In the case of the Bluefield Water Works & Improvement Co. against the Public Service Commission of West Virginia, the Court, in an opinion by Associate Justice Butler, held that **the rates fixed for water service at Bluefield were too low**, and that under the facts presented **the company was entitled to a return of more than 6 per cent.** Associate Justice Brandeis agreed with the other members of the Court in reversing the state court, but noted the same position regarding replacement values that he took in the case of the Southwestern Telephone Co. against the Missouri Commission, decided the week previous. In the case of the Georgia Railway & Power Co. and the Atlanta Gas Light Co., its lessor, the Supreme Court, in an opinion read by Associate Justice Brandeis, affirmed the decree of the lower courts **dismissing a suit against the Railroad Commission of Georgia to restrain reduced rates for Atlanta's gas supply.** Associate Justice McKenna dissented from the majority opinion, holding that replacement value, as fixed in principle by the Court in the cases of the Southwestern Telephone Co. and the Bluefield Water Works & Improvement Co., had not been applied in this Georgia case. The majority opinion pointed out that in the Atlanta gas case, the Railroad Commission had carefully considered replacement value and increased costs, although it did not allow all the claims of the company in this regard; hence the case differed from the others cited as precedents.

The U. S. Civil Service Commission announces open **competitive examinations for valuation engineer** ($3,600 to $4,800 a year) and **associate valuation engineer** ($3,000 to $3,600 a year), oil and gas, coal mining and timber. Applications will be rated as received until Aug. 31. The examination is to fill vacancies in the technical staff of the income tax unit of the Bureau of Internal Revenue, Treasury Department, and in positions requiring similar qualifications. Full information and application blanks may be obtained from the U. S. Civil Service Commission, Washington, D. C., or the secretary of the board of U. S. civil service examiners at the post office or custom house in any city.

CANADA

During the last two months there has been a heavy slump in the coal mining industry in British Columbia, particularly at the Vancouver Island collieries, the majority of which are working only half time. Coke production at the Crow's Nest mines has fallen off to a corresponding degree.

The floods in southern Alberta and southeastern British Columbia have done some damage to the coal mines and have completely disorganized the railways that serve them. The airshaft at the Galt mine has been caved in by floods and much water has entered the mine, and the tipple and screen at the Federal Coal Co.'s plant have been carried away. Traffic on the Canadian Pacific Crow's Nest Pass branch has been completely disorganized by washouts at Cowley and Michel, and for the time being is routed via the main line and the Kootenay central branch. Towns on the Crow's Nest Pass are being served by local trains that run between the washouts.

Canadian mines produced during February 1,611,800 net tons of coal, a decrease of 8 per cent from the output of January, which amounted to 1,745,700 tons. The February output was, however, 27 per cent greater than the previous three-year average for the month. The combined outputs from the mines of Nova Scotia, Saskatchewan, Alberta and British Columbia were 132,000 tons less than in January. The cumulative output from all mines for January and February amounted to 3,357,500 tons. This figure, against the three-year average for the period, showed a gain of 26 per cent. Importations of all coal during the month of February amounted to 1,326,200 tons, a decrease of 19 per cent from the January imports but 29 per cent above the three-year average for the month. Included in the February imports figure was 64,200 tons from Great Britain. Total importations of all coal for January and February was 2,967,900 tons, an increase of 37 per cent above the three-year average. The imports of anthracite during February were approximately 1,000 tons greater than in January and amounted to 422,550 tons, including 42,200 tons from Great Britain. These imports were 49 per cent greater than the three-year average for the month.

Decision to tie up every colliery in the Sydney Mines district and to halt all shipping of coal from the piers at North Sydney was reported at a meeting of miners June 14. The decision followed the dismissal of certain employees in the Florence Colliery. The strike was to begin June 15.

Coal production in British Columbia during April shows a marked falling off as compared to March figures, the decline amounting to 65,246 tons. The weakness of the market is reflected in the output of each of the three chief coal fields of the province. At present there are no signs of improvement. All the Vancouver Island mines are working half time and the crews of most are being reduced. The only exception to this is the East Wellington Coal Co., operated by J. Grant, which is included among the producers for the first time and which mined 1,044 tons. The Canadian Collieries (D), Ltd., and the Western Fuel Corporation of Canada are the most affected in this field. The Crow's Nest of the Eastern Interior seems to be facing the necessity of slowing down also, as production there has dropped from 79,509 to 56,651 tons. The British Columbia April, 1923, output is shown in this report.

	Tons
VANCOUVER ISLAND DISTRICT	
Granby C. M. S. & P. Co.	19,908

Total for province	190,554

Association Activities

Coal Operators' Association of Fifth and Ninth Districts of Illinois

The annual meeting and election of officers of the Coal Operators' Association of the Fifth and Ninth Districts of Illinois was held June 12 at the Missouri Athletic Association, St. Louis. After a light lunch the happenings of the past year effecting the coal industry were reviewed and discussed by the president, Dr. C. H. Krause, and the vice president, H. C. Perry. Both speakers cited the tendency in Illinois as well as some other districts to handicap the coal industry with legislation which would not only be a detriment to the coal industry itself but to other industries as well. Hope was expressed that the report of the U. S. Coal Commission soon to be made would prove to be a foundation around which constructive work in making of wage agreements might be carried on with resulting greater stability in the future than has been experienced in the past few years. The necessity of service as the foundation of true prosperity was emphasized. Officers re-elected for the ensuing year are: Dr. C. H. Krause, president; H. C. Perry, vice president; O. L. Lumaghi, secretary-treasurer.

Mine Inspectors' Institute of America

The Mine Inspectors' Institute of America will hold its annual meeting in Pittsburg, Kan., July 10, 11 and 12, 1923. Headquarters will be the Stilwell Hotel. The following are subjects to be discussed: (1) Electric machinery in gaseous mines, and its limitations for safety. (2) How to recognize a dusty mine, from the standpoint of danger. (3) Should the use of black blasting powder be prohibited in all bituminous mines? (4) What can be done to reduce accidents from falls of roof: (a) by additional legislation; (b) by the operator; (c) by the miner; (d) by the state inspector? (5) Is compensation and aid in reducing mine accidents? (6) What reduction in accidents has resulted from safety organizations conducted by the operator, and what are the main features of any that have proved a benefit? (7) Is it practicable to frame a basic mine law suitable for all bituminous mine conditions as a model for promotion of uniformity in state laws, as they relate to accident prevention and general safety? (8) In what manner can the Federal Bureau of Mines be of greatest assistance to the state mine inspectors? Discussion opened by Dr. J. J. Rutledge, Chief of the Bureau of Mines, Maryland.

Trade Literature

Steam Turbines for Power Distribution in a By-Product Coking Plant. De Laval Steam Turbine Co., Trenton, N. J. Four-page folder describing and illustrating installation of steam turbines in the by-products coke oven plant of the New England Fuel & Transportation Co. at Everett, Mass.

Centrifugal Pumps and Centrifugal Pumping Units. Allis-Chalmers Mfg. Co., Milwaukee, Wis., Bulletin No. 1632-F., Pp. 58; 8 x 10 in., illustrated; tables. On pages 28 and 34 are described pumps for the power plant and for unwatering and drainage purposes at the mines. Instructions for installation and operation of horizontal centrifugal pumps cover pages 50 to 55.

Combusco Ash Conveyor. Combustion Engineering Corporation, New York City. Pp. 11, 8 x 11 in., illustrated. Among the advantages claimed for this new apparatus are that it dispenses with manual labor, quenches the ashes as they fall from the furnace, prevents all dust, fumes and heat in the ash tunnel, maintains a perfect air seal in the combustion chamber, improves the efficiency of the boilers by preventing air leakage, removes the ashes and clinker from the furnace automatically and continuously and does not necessitate that the boilers be built above the ground level as the conveyor can be built in the setting.

Shuveloder. Lake Superior Loader Co., Duluth, Minn. Pp. 23; 8 x 11 in., illustrated. The shuveloder is shown at work excavating fire clay without blasting, loading rock brushed from the roof, etc. The savings from the use of this machine is given in a report from the superintendent of a coal company.

American Power Pumps. American Steam Pump Co., Battle Creek, Mich., Bulletin No. 18. Pp. 15, 6 x 9 in., illustrated. Describing the following power pumps: Duplex, geared, belted, gathering or dip pump and motor-driven pump.

A Handbook of Rock Drill Steel. Sullivan Machinery Co., Chicago, Ill. Circular No. 72-G. Pp. 79, 5 x 7 in., illustrated. This useful little book describes the selection, heating, forging and tempering of rock drill steel. Included also are instructions for the care and use of Sullivan drill sharpeners and drill steel furnaces.

Traffic News

The United Collieries, Inc., of St. Charles, Va., has filed a complaint against the Southern Ry. in the matter of car supply.

Complaints have been filed by numerous consumers in Atlanta against existing rates on coal from points in Kentucky and Tennessee.

The Chesapeake & Ohio Ry. has appointed A. M. Dudley general coal freight agent in charge of all coal and coke traffic, vice H. S. Smith, coal freight agent, who is appointed assistant general freight agent with offices at Richmond, Va. The change became effective June 1.

The Interstate Commerce Commission hearing set for June 18 to consider matters in connection with the case of Winding Gulf Colliery Co. versus the Chesapeake & Ohio Ry. has been postponed until July 9. Examiner W. H. Wagner will conduct the hearing in Washington on that date.

In the case of the Detroit Coal Exchange attacking rates applied on anthracite during a portion of 1918, the Interstate Commerce Commission has ruled that the **rate applied by the carriers was unreasonable to the extent that it exceeded $3.70 per gross ton.** The commission has **upheld the contention of the Utah Fuel Co. in regard to unreasonable rates** on intra-plant switching service. **Reparation has been awarded the Terre Haute Paper Co.** because of unreasonable intrastate rates charged during federal control.

Thirty-five million dollars is the total expended in 1922 and authorized for 1923 **for improvements by the Norfolk & Western Ry.** Orders were given for 7,500 coal and freight cars, nearly all of which have been received and are in service. Forty-two heavy-type steam locomotives also were ordered and most of these have been delivered. Four of the big electric locomotives are due to be delivered this autumn. Large expenditures are under way for additional main-line track at a number of points where a third track is being installed, the object being to make the line a three-track line, at least, through the coal field and most of the way to Roanoke. To facilitate the western movement, the Auville yard is being considerably expanded. Double-track extension, involving considerable excavation, is being pushed rapidly from Bluestone to Ruth. This extension is leading up to one of the biggest improvements about to be started, a duplicate of the Coaldale tunnel over a mile in length to be driven as soon as the preparatory work is finished on the approaches to the Coaldale tunnel. Another big improvement under consideration is the probable double-tracking of a portion of the Big Sandy line of the Norfolk and Western. Although a great amount of construction work is observed from Bluestone east, including the third-track extension work at Shawsville, the greater portion of improvements have been contracted for west of Bluefield and west to Cincinnati and Columbus, where the volume of traffic of the road is growing rapidly.

The Coal and Coke Committee, Trunk Line Territory, announces hearings at 143 Liberty Street New York, commencing June 28, relative to adjustment of rates on coke from regions on Pennsylvania System and lateral connections to points on the New York, Ontario & Western Ry. and to New Berlin, N. Y., Unadilla Valley Ry.; from ovens on the Buffalo, Rochester & Pittsburgh Ry. to points on the New York Ontario Western Ry; on bitmuminous coal from mines on the Norfolk & Western Ry. to points on the Washington division of the Southern Ry. and from mines on originating lines to the Erie R.R., Barton to Owego, N. Y., inclusive; D. L. & W. R.R., Litchfield to Owego, N. Y., inclusive, and L. V. R.R., Hanna to Owego, N. Y., inclusive. The reasons for these proposals are to remove fourth section departures and to establish the same rates to the same rates the same or contiguous points on the Erie R.R. and the D. L. & W. R.R.

The New York, New Haven & Hartford R.R. had a deficit after all charges of $4,865,767.92, says the annual report for 1922 of E. J. Pearson, president. This is attributed to the cut in freight rates, increase in the cost of fuel owing to the coal strike, increase in operating expenses owing to the shop-crafts strike, and congestion of traffic following the settlement of the coal strike, aggravated by unusual winter adversity. This company owns 291,622 shares, or 50.2 per cent, of the capital stock of the New York, Ontario & Western R.R., having a total value of $13,108,397.62. Operating revenues for the year were $123,246,640.64, an increase of $6,841,407.77 over 1921. The revenue from freight increased $6,337,747.34, or 11.83 per cent, while the freight carried showed an increase of 2,224,301 tons over 1921. The report shows that there was spent for fuel for yard locomotives $2,006,344.60, an increase of $186,590.37 over 1921, and for train locomotives $9,224,123.80, a decrease of $140,664.55 over 1921.

Rates on coal from the mines of the Commercial Coal Co., in the McRoberts group on the eastern Kentucky division of the Louisville & Nashville R.R. to Louisville, Cincinnati and other points west of the Illinois-Indiana line are not unreasonable, but are unduly prejudicial to the extent that they exceed the contemporaneous rates from the Hazard group, in the opinion of John McChord, an attorney examiner for the Interstate Commerce Commission. In his tentative opinion in this case he points out that the rate groups of this division are not of long standing and that the extensions of the Hazard group in recent years is convincing that they are in a state of evolution.

On June 1, according to the Car Service Division of the American Railway Association, **railroads of the United States had 51,281 serviceable locomotives**, which is the largest number on record for any time during the same period. This was an increase of 694 over the number of such locomotives on May 15 which had previously marked the peak. Locomotives in need of repair June 1 totaled 12,683, 19.9 per cent of the total number on line, which is the smallest number in need of repair for any time since the Car Service Division began the compilation of its locomotive records. The railroads repaired and turned out of their shops from May 15 to June 1 21,406 locomotives, the largest number for any semi-monthly period on record. The total number of locomotives in need of repair on June 1 was a decrease of 812 since May 15, at which time there were 13,495 or 21 per cent.

Three members of the Interstate Commerce Commission dissented from the majority opinion in the case of John Hawkins and Co., coal dealers of Nutley N. J., against the Erie Railroad Co., involving a demurrage question. The shipments involved in the case originated at Pennsylvania mines during October and November, 1919. They were stopped in transit, by orders from the U. S. Fuel Administraiton. The Hawkins track had a capacity of two cars. The cars, through no fault of the consignee, were bunched in transit and when delivered the coal was frozen. Immediately on their arrival, however, the consignee set about vigorously to thaw the coal and unload it. While all of the demurrage regulations were not compiled with, the majority holds that the commission's powers "should not be construed so narrowly as to defeat justice." On that basis, the Hawkins Co. was awarded reparation in the full amount of the demurrage charges paid. Commissioner Hall, in a dissenting opinion, declares that "we have no jurisdiction to mitigate the seeming harshness of the law."

Coming Meetings

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the **International Safety and First-Aid Meet.** Secretary, Benedict Shubart, Denver, Colo.

Iron and Steel Exposition at Buffalo, N. Y., Sept. 24-28. Association of Iron and Steel Electrical Engineers, Empire Building, Pittsburgh, Pa.

National Retail Coal Merchants' Association will hold its sixth annual convention June 25, 26 and 27 at Scranton, Pa., with headquarters at the Hotel Casey.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

American Institute of Electrical Engineers will hold its annual convention June 25-29, at Swampscott, Mass. Secretary F. L. Hutchinson, 29 West 39th St., New York City.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

National Coal Association will hold its sixth annual convention June 19-22, at Atlantic City, N. J. Assistant secretary, C. C. Crowe, Washington, D. C.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting lill start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**. Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

West Virginia Coal Association will hold its annual meeting Tuesday afternoon, June 19, at Atlantic City, N. J. Secretary W. H. Cunningham, Huntington W. Va.

Mine Inspectors' Institute of America will hold its 13th annual meeting July 10-12 at Pittsburgh, Kan. Secretary, J. W. Paul, 4800 Forbes St., Pittsburgh, Pa.

Ontario Mining Association will hold its annual meeting July 5 at Kirkland Lake, Ont., Can. Secretary, B. Neilly, Toronto, Ont., Can.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, JUNE 28, 1923 Number 26

Lewis Fights the Reds

BORING from within, the radicals are attacking the United Mine Workers. Led by the well-known William Z. Foster and the indefatigable Alex. Howat a movement styling itself the Progressive International Committee of the miners' union has sprung up in the Pittsburgh district. As pointed out in a statement given out by the International Executive Board of the United Mine Workers at Indianapolis last week, this movement is part and parcel of a kind that has infested the Southwest and several parts of Canada. The union authorities "view with great concern" the spread of radicalism in the ranks of the mine workers. The executive committee gave a week or more to a study of how to check it. They are setting out to discard from their organization those who participate in such "dual" associations.

The American labor movement is sincere in its condemnation of radicalism and consistently repulses its spread, even if at times making much ado of the process. It is not a straw man that is being knocked down. The menace to the United Mine Workers has become so real that John L. Lewis can no longer temporize. The outlawry within his organization has assumed such proportions in the last few years as to threaten conservative leadership. So sinister has the cloud become that, it is reported, Farrington has joined hands with Lewis, abandoning his support of the reds, assumed in the past for political purposes, in the effort to save the union from the assault of communism.

It is going to be a stiff job to mop up the scuff, especially after playing with it for so long, but it is giving the Lewis régime a valuable lesson. Perhaps, and we so hope, a chastened United Mine Workers will result—one less inclined to take the country by the throat, one more inclined to reason than war.

Can Bituminous Coal Use an Overlord?

JOHN C. BRYDON, last week elected president of the National Coal Association, set both feet in a forward direction in his characteristic aggressive way. He told the soft-coal operators that their industry needs a leader and executive who is influenced neither by his own business interests nor sectional considerations, and that on top of the individual operator's interest in mining and distributing coal efficiently there is a responsibility resting on the industry as a whole to look after the fuel requirements of the country.

He advocates a full-time executive as the head of the National, one to whom the public may look with respect as well as one who can command the producer, large or small. The idea is not new, for, encouraged by the success of Judge Landis, Will Hays and Franklin Roosevelt with baseball, moving pictures and construction respectively, these coal men have been considering its possibilities in the coal industry. To Mr. Brydon has been given the task of putting the idea to work. As a means of consolidating a wide variety of interests and harmonizing a medley of opinion no happier solution has been voiced.

But it is because Mr. Brydon coupled with his recommendation for the new kind of leadership the suggestion for the organization within the soft-coal industry of the kind of machinery for public service that the anthracite operators have developed so well and time and again demonstrated its effectiveness that he may be credited with being in the way of removing the operators' "blind spot." Experience has demonstrated that the public is less inclined to be suspicious, is in fact, more tolerant and less exacting of any group of business men who give evidence of taking the people into their confidence. The way to the heart of the public lies in telling your good points rather than stressing the bad points of your associates.

The idea, for instance, has been fostered and allowed to grow that the soft-coal industry is inefficient and wasteful. In certain respects this is true, but not more so than of other industries. As between apologizing for its shortcomings and expounding the simple facts with respect to the big things the coal industry does accomplish, there is no argument as to which is better publicity. Restriction of output by the unions is an example of internal maladjustment the recital of which serves but to cast doubt on the ability of its management, whereas a widespread understanding of the development of mining machines, fast underground transportation, safety practices and equipment for cleaning and preparing coal for market will give the public a new confidence in the industry.

There is nothing novel in Mr. Brydon's suggestion of machinery for emergency distribution of soft coal. As regards the needs of the government in war time, the plan was successfully worked out in 1917 prior to the Fuel Administration. Considerably more than half the machinery and expense of the distribution machinery of the Fuel Administration was supplied voluntarily by the coal operators. In 1920 arbitrary distribution was urged by the operators' organization and made effective through the power of government. The operators went even further then and set up "fair-price" committees the effectiveness of which none may doubt.

Nor is it pertinent at this time to inquire as to how far anyone may commit the soft-coal industry to any particular line of performance. It is quite certain that it has no such large element as the feudalistically controlled Hudson Coal Co. in the anthracite industry to confound its combined effort in the public interest, or in its own interest, for that matter.

The program on which Mr. Brydon starts off is not a spontaneous extemporaneous outburst. It follows logically the thinking, planning and desires of the retiring president of the National Coal Association, Alfred Ogle, who surrenders the reins after the most turbulent year in the history of that organization.

Does It Pay to Restrict Expenditure?

NO ONE can deny that Frank Haas, in his paper before the West Virginia Mining Institute, printed this week, has chosen an admirable subject for consideration, nor can it be gainsaid that he has applied most valuable principles in reaching his conclusions on the value of economy in laying out a mine. Subtle methods of reasoning, however, need careful investigation or errors will creep in, not only mathematical errors but those having to do with assumptions. Consequently we are justified in questioning whether all Mr. Haas' premises are correct.

Is he, for instance, justified in assuming that the gross earnings per ton of expensively and inexpensively equipped mines are equal? We are not by any means convinced that this is true. Men do not spend $2 instead of 50c. per ton of annual production for building their plant, much less $8 and even more, as some are doing, without the hope that the gross earning per ton of coal mined will be increased and that the net earnings will be greater in consequence, though it is recognized that they will be reduced somewhat by the higher fixed charges.

Mr. Haas is right in holding that if the gross earnings per ton are not increased by greater expenditures they will justify the conclusions he has reached, but granted that better equipment and outlay does more than raise tonnage, then his results must be accepted with appropriate reserve.

Here it should be stated that large tonnages themselves have a way of reducing labor bills and so with any given price for coal they increase gross earnings. Expenditures on certain classes of machinery improve quality and raise the selling price, thus also increasing gross earnings. These facts cannot be waived aside as matters of no commercial importance. In fact we are afraid that in making his calculations Mr. Haas has quietly and unintentionally assumed that which he wishes to prove, and that done, all that follows is quite to be expected.

Nor are we clear that obsolescence is to be satisfactorily disposed of as Mr. Haas has indicated. There is obsolescence of two kinds in a mine—one due to machinery becoming antiquated and another due to inherent mine obsolescence. The mine in time becomes difficult to ventilate; airways that are adequate in a young mine are less equal or even unequal to the work of ventilating an old one. The fan becomes inefficient from the same cause, the equivalent orifice of the mine changing. Larger locomotives become necessary. New airshafts must be sunk or new openings made. These are progressive changes, growing with the progress of the mine.

We may not perhaps scrap or sell the machinery, but if we do not, we face a steady and far heavier loss. The burden of using obsolete machinery or running with obsolete conditions is even heavier than that borne by the man who brings his mine up to date. If we scrap the equipment and buy new, if we make further development to supplement that which is inadequate, we add to the fixed charges. Consequently we decrease the net earnings. This obsolescence is likely to be less if the first equipment is fully abreast of the times when installed and its purchase not too closely based on the principle of keeping down equipment costs. It will be distinctly less if the early development is conceived on a sufficiently liberal basis.

If we assume that the mine is allowed to remain obsolete the fixed charges will remain the same but the cost of labor will increase. If the excess of selling price over payroll and material costs is 50c. when the mine is opened, can we assume that it will still be 50c. when the mine has been working 20 or even 40 years? The operating cost may be so high by that time that there may be no net earnings. Of course, other competitive mines are being subjected to a similar increase in operating costs, and in consequence the price of coal may be kept at a level giving the same excess over payroll and material costs, but that is an assumption not very safe in the United States with new mines always opening, some of which are in new territory.

Mr. Haas has led the way to a new kind of thinking. His mistakes are not easily corrected but we are convinced that some of them will make a revision necessary, and we prophesy that the author of the paper will be one of the first to venture on their correction, as his logical precision and long experience will fit him to do.

Eliot's Eight Points

CHARLES W. ELIOT, president emeritus of Harvard University, set forth for the coal operators assembled at Atlantic City last week the eight points which he considers represent what the public has a right to expect the United States Coal Commission to cover in its recommendations.

Those points dealing with the necessity of provision for keeping order in the coal fields and for protection of the public against monopoly either among employers or employees will be readily accepted, as should the proposal for incorporation of the union. Two of Dr. Eliot's points deal with development of a partnership relation between management and labor, one aspect of which, of course, would be the elimination of restriction of output. Partnership involves the idea of participation in profits. Just how much further Dr. Eliot would have the industry go than at present in this regard is not stated but the fact remains that through the exercise of its "economic strength" the miners' union has exacted its share of the profits from an industry that until the war had no profits. The union has gone further and assumed a large share of management. In the union fields the mine workers are partners just so far as they are willing to take on that relationship.

The remaining three of the eight points have to do with arbitration of industrial disputes. Here most assuredly lies the greatest public interest, for the public suffers most from lack of coal when the mines stop. Dr. Eliot points out the "high value toward prevention and settlement of industrial disputes of face-to-face discussion between parties before an impartial tribunal whose decision is effectively published." This is a fair statement of the problem that has been facing the coal industry, but who is to induce the United Mine Workers to accept any form of arbitration?

By Sumner S. Smith
Eska, Alaska

SO MUCH has been written in a general way regarding Alaskan coal fields that a description of the Eska mine, though it be small as compared to Eastern standards, may be warranted at this time because to date, it is the largest producer of coal in Alaska and is characteristic of this field.

The mine is approximately 60 miles from Anchorage, at the terminus of a three-mile standard-gage spur from the Chickaloon branch of the government railroad. The mine openings are on Eska Creek, a rather short, turbulent stream which rises in the Talkeetna Mountains to the north, follows the valley on the eastern flank of Wishbone Hill and flows into the Matanuska River near Mile A-18 on the railroad branch.

The natives who lived in the Matanuska Valley for many years knew of the existence of coal and mention is made of these beds in 1898 by W. C. Mendenhall, who accompanied Captain Edwin F. Glenn as geologist on the military expedition from Prince William Sound toward the Tanana by way of the Matanuska River. The earliest recorded locations were made about 1903 and much prospecting was undertaken on Moose, Eska, Coal and O'Brien creeks, Chickaloon River and Kings River. Reconnaissance parties from the U. S. Geological Survey made investigations in 1905, 1906 and 1909, and in 1910 a detailed study of the valley was made by Dr. G. C. Martin.

In 1906 all the coal lands in Alaska were withdrawn from entry by an executive order of the President and were not restored until 1916, following a subdivisional survey by the U. S. Land Office in 1915, when the areas believed to contain coal of commercial importance were laid out in leasing units.

In 1912 President Taft sent a commission to Alaska to report on the feasibility of constructing a railroad from the coast to the interior of the territory and in 1914 Congress passed an act authorizing this project. In the spring of 1915 the President selected what is commonly known as the Broad Pass route, which has its ocean terminus at Seward, follows round the head of Turnagain and Knik arms, crosses the Matanuska to the Susitna drainage, goes through Broad Pass, down the Nenana and up the Tanana drainage to Fairbanks.

It was stipulated that a branch should be constructed up the Matanuska Valley to open the coal fields. The route selected for the main line was approximately 470 miles long and the branch route 40 miles. The town of

Note—Headpiece shows the Eska coal mines. The building with the dog is the mess house, that on the near side of it is the store; the house next to it toward the foreground with the projecting roof is the office; the long building still further in the foreground is a bunk house and the small building with white roof is the hospital. The power house is seen over the dump on the left and the two trestles to the right are for Martin East, Shaw East and Eska East Mines and for the Maitland Mine, respectively. The small stream in the foreground is the turbulent Eska, kept in place by sundry cribbings. (Cut captions added by editorial department.)

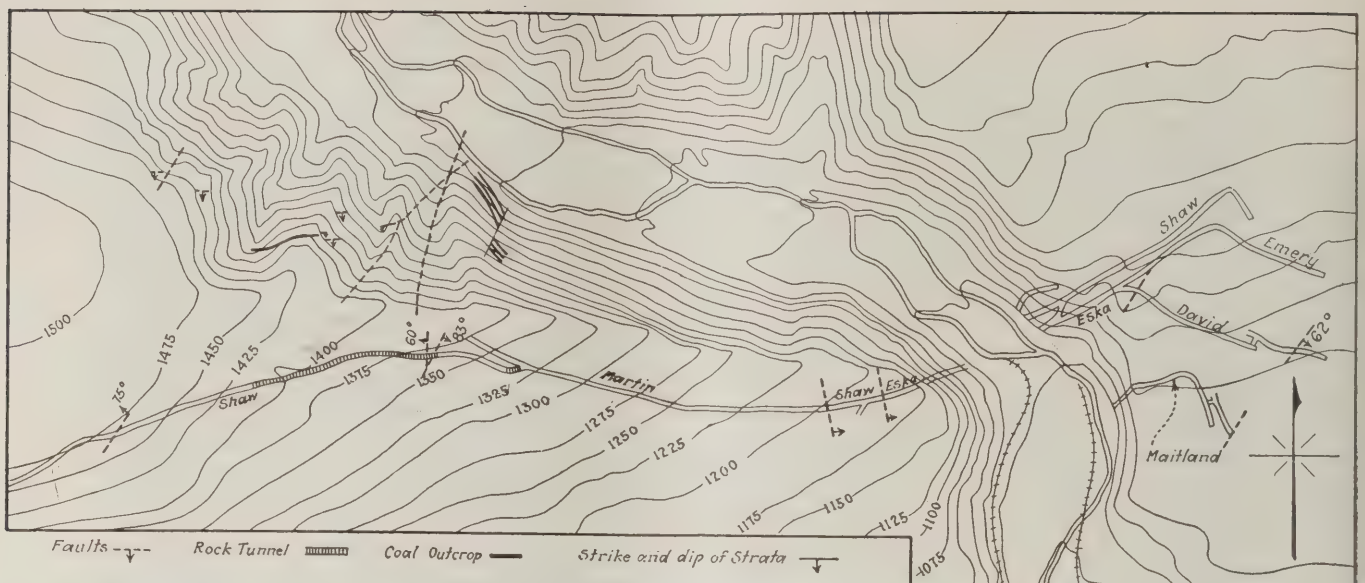

FIG. 1—MAP OF ESKA MINES

The Eska, Shaw and Martin are within a short distance of one another, and the faulting makes it possible to go from the Eska to the Shaw and from the Shaw to the Martin on easy grades, the Eska being the higher bed and the low beds being lifted by faults to the level of the Eska and then raised again so that the road in the Martin is on a level with the road in the Shaw.

Anchorage was established as a base in 1915 and construction of the road started in May of that year. The Matanuska branch was started in 1916 and completed in 1917.

The Alaskan Engineering Commission commenced contracting for its fuel locally in 1916, when a number of small contracts were let to local operators to supply coal for railroad work. In the autumn of 1916 William Martin, an attorney of Seattle, who was interested in lode gold mining in the Willow Creek district, applied for and was granted a lease on Unit No. 7, the greater portion of which lay on the western side of Eska Creek on the eastern flank of Wishbone Hill. This lease was later assigned to the Eska Creek Coal Co., which corporation commenced work in January, 1917, erecting log buildings for use as dining room and bunkhouse with several tents for living quarters and warehouses.

Five entries were started, three on the west and two on the east side of the creek, and open cuts were made which exposed several other beds, although all of these seams were thin, the biggest being less than 5 ft. thick. The company obtained a contract to supply a portion of the fuel used by the Alaskan Engineering Commission and hauled the coal in sleds from the mine to the railroad, a distance of approximately three miles. With the advent of spring the coal could not be hauled with any satisfaction in sleds or wagons, so a standard-gage spur was constructed on the property and another contract let based on the delivery of coal in railroad cars at the mine.

Soon after the completion of the spur the coal in the entries driven by the lessees was cut off by a somewhat complicated series of faults, and as the company did not care to assume the expense of opening other beds,

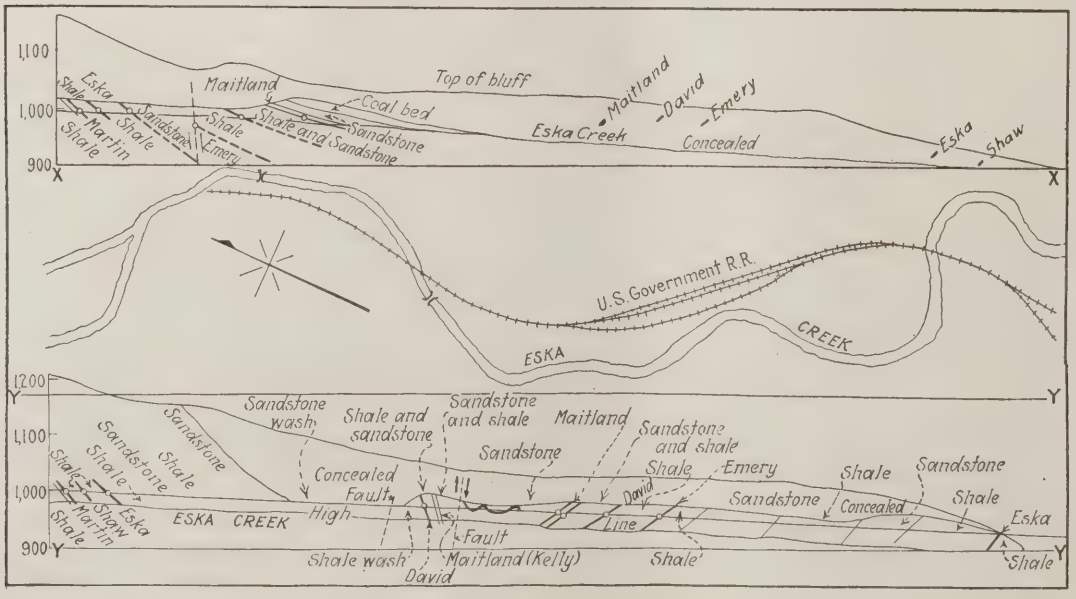

FIG. 2

Geological Map, Eska Field

Plan and two cross-sectional elevations taken at XX and YY. A steep-sided syncline runs across the Eska River. The measures also are faulted and in eastern section are cut by igneous dykes.

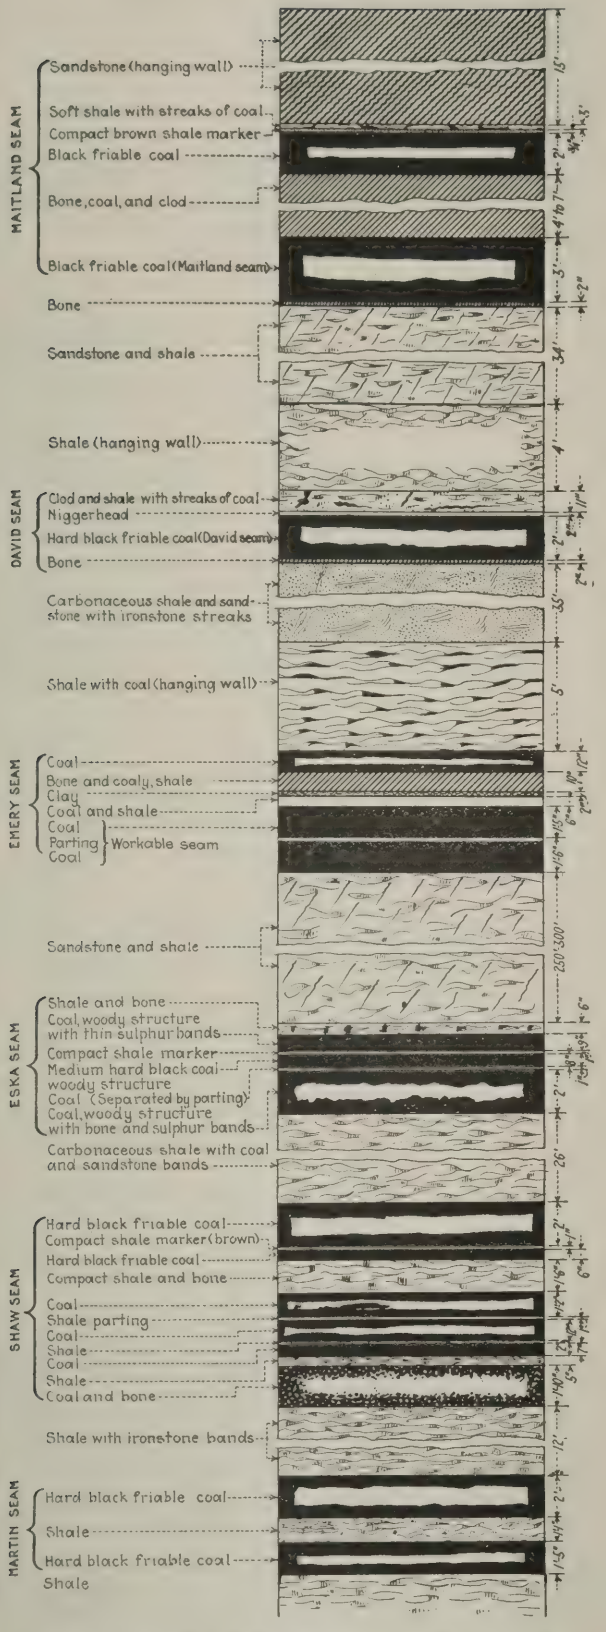

FIG. 3—CROSS-SECTION OF COAL MEASURES

The Eska measures are in two divisions, the upper and the lower. The upper consist of the Maitland, David and Emery, and the lower of Eska, Shaw and Martin. The sandstones and shales between the two groups are 250 to 300 ft. thick. Breaks have been made in the section where the bigger intervals occur.

though their outcrops indicated an abundant supply of fuel, the property was sold to the Alaskan Engineering Commission in June, 1917.

Upon taking over the property, the commission enlarged the dining room, constructed an additional bunkhouse, a washhouse and change room, an office, store, power house, first-aid hospital and six cottages for married employees. Water, sewer, light and telephone systems were installed and work started on a hand sorting plant where the coarser refuse was picked from the screened coal. This and a railroad yard were completed in 1918, since which time three cottages, a staff house and a 48-room dormitory which is modern in every respect have been added to the living quarters. In October of 1921 the mine was closed and all fuel for the railroad purchased from local operators, but in November, 1922, a fire in the adjoining property closed that mine and cut off the commission's chief supply of bituminous coal, which is used for all engine service, and the Eska property was immediately reopened.

The Matanuska Valley is a sunken fault block between two rugged mountain ranges, the Talkeetnas on the north and the Chugach on the south. Here the coal-bearing measures of the valley have been folded and bent and, in the eastern end of the district, invaded by igneous dikes. The coals are of the same geologic age as the Cook Inlet lignites, but, due to the processes mentioned, have advanced in grade till all types, ranging from lignite on the west to anthracite on the east, may be found throughout the valley. The medium-rank bituminous coals are excellent steam or domestic fuels and the higher-rank coals of this grade are first class for blacksmith use or the manufacture of metallurgical coke. On the recent tests made by the navy these coals were demonstrated the equal of the coals of navy standard of the Atlantic coast. The two analyses in Table I are typical of bituminous coals of different rank from different portions of the field:

TABLE I—TWO ANALYSES OF MATANUSKA COALS

	Coal, Air Dried	Coal, As Received	Coal, Moisture-Free	Coal, Moisture-and-Ash-Free
Maitland Bed, Eska Mine				
Moisture	3.23	5.06	.....	.....
Volatile Matter	42.82	42.01	44.25	47.90
Fixed carbon	46.58	45.70	48.13	52.10
Ash	7.37	7.23	7.62	.....
	100.00	100.00	100.00	100.00
No. 3 Bed, Chickaloon Mine				
Moisture	0.5	1.4	.....	.....
Volatile	18.5	18.4	18.6	20.3
Fixed carbon	73.0	72.2	73.3	79.7
Ash	8.0	8.0	8.1	.....
	100.00	100.00	100.00	100.00

The above samples are selected because of the similarity of their ash content. It is probable that the average samples cut at Eska would run higher in ash and those at Chickaloon somewhat lower than the above.

The stratigraphic cross-section shown in Fig. 2 was worked out by Dr. George C. Martin and Theodore Chapin, of the U. S. Geological Survey, and the following quotation is taken from Bulletin 712-E of the Survey by Chapin: "The coal-bearing rocks at the Eska Mine occur in an open syncline whose axis strikes across Eska Creek near the center of the mine camp. The coal beds have been identified on both limbs of the syncline and on both sides of the creek, which crosses the coal tract and divides it into two parts. Stratigraphically the coal beds occur in two groups of three each, separated by a thick integral of sandstone and shale. Although the coal and the enclosing sediments vary in character and thickness from place to place, the coal beds have prominent markers which are persistent enough to identify the beds with little doubt wherever they have been opened."

In mapping the structural geology of the mine a crushed or faulted zone was noted about 1,500 or

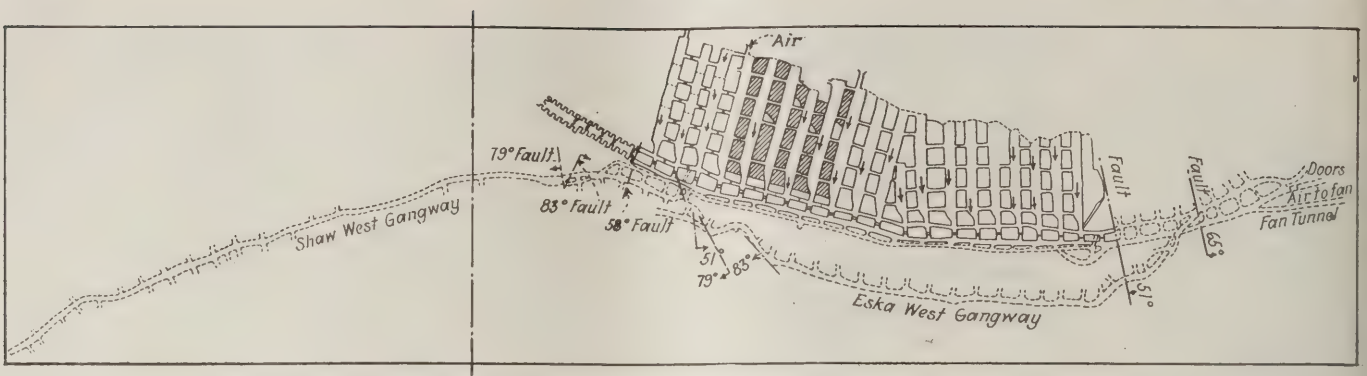

FIG. 4—PROGRESS PLAT OF MARTIN WEST MINE IN LOWEST SEAM OF SERIES
This also shows in broken lines the roadways driven in other beds of coal, the Shaw and the Eska, some of these roadways in other seams being part of the ventilation and transportation system of the Martin West workings though not in that bed.

1,600 ft. west of the portal of the Eska West gangway. This zone was several hundred feet in width and its position indicated that the coal on the northern limb of the syncline would be off when the gangway reached a point along the strike of this fault. Fragments of the known coal beds were uncovered on the surface in this area, and the seams traced to points where the structure appeared fairly regular (Fig. 2). From a series of observations on the dip and strike of the strata along the outcrops of the coal beds the probable position of the beds on the same level as the Shaw gangway was plotted on the map and this entry driven nearly 700 ft. through the rock to pick up these seams.

All haulageways, or gangways, are driven on the coal, the standard timber set being 6 ft. wide at the top, 9 ft. at the bottom and the collar 6½ ft. above the rail. Forty-pound steel is used on the mine tracks, which have a gage of 36 in. and a grade of 0.6 per cent in favor of the loads. The airways, which are from 5 to 6 ft. wide and approximately 4 ft. high, are driven so as to leave a 30-ft. pillar between them and the haulageways. Chutes are 8 ft. wide, giving 4 ft. for the manway and 4 ft. for the coal chutes, which are lined with sheet iron. The coal is mined by the room-and-pillar system, the rooms being driven 20 ft. wide and on 50-ft. centers. Crosscuts are driven between rooms every 50 ft. On the west side the pitch varies from 25 to 45 deg. In consequence, the coal runs readily in the chutes, but on the east side the Maitland and David seams dip approximately 10 or 12 deg. on the northern limb of the syncline where they have been opened. On the Maitland bed the practice has been to use a McGinty with two small cars running in balance to convey the coal from the face of the rooms to the gangway, but on the David roof conditions were such that a large quantity of material had to be gobbed and but little room left for tracks. Here a chute and manway were carried close to one rib, the chute being well lined with sheet iron. A water main from tanks just above the David workings was laid along the gangway with branches to each room. With water thus supplied the coal was flushed to the cars below. The volume of water per ton of coal moved was fairly constant regardless of the distance from the face of the room to the gangway. About 218 gallons of flushing water was used for each ton of coal thus conveyed.

The coal is sheared on one side of the room and shot with permissible powder, Monobel No. 5 or Miners' Friend No. 5, both proving satisfactory for this work.

FIG. 5—MINERS' DORMITORY, ESKA MINES, JULY 23, 1921
Alaska blooms in her short summer. This does not look like a land of snows. The Alaska Engineering Commission's operation is marked by all due frugality. Neither the nation nor the nation's people can afford to venture too far from economical business principles, and Eska shows no prodigal expenditure of the taxpayers' money.

When the rooms are driven rapidly and the pillars removed promptly no trouble is experienced with squeezing along the entries or caving in the rooms, but if the rooms are driven and the pillars allowed to stand a long time the recovery of the pillar coal becomes a difficult matter.

Fig. 3 gives stratigraphic cross sections which indicate the thickness of the beds and the mining conditions better than any description.

The coal is hauled about 2,500 ft. from the mine to the cleaning plant, where it passes over a ¾-in. shaking screen, the lower end of which acts as a picking table where the coarser of the refuse is removed. As practically all the coal is used by the railroad the fine and the picked oversize is allowed to run into the same car and is shipped as run-of-mine, although it can be loaded separately as lump and steam coal. The coal as thus shipped will average about 20 per cent ash. With proper washing this probably could be reduced to 14 per cent. There are, however, several other properties in the Eska district the run-of-mine coal from which has an ash content which is only a trifle in excess of 10 per cent.

The mine is ventilated by two Jeffrey double-inlet stepped multi-bladed reversible fans belted to steam engines. As there is practically no gas in the mine, the main haulageways are made the returns, thus preventing the water in the ditch from freezing and overflowing the track in winter time. The details are shown on the mine maps.

Because of the physical condition of the seams and the lack (in the past) of proper washing equipment it was considered better to pay day wages rather than contract the mining of the coal. Skilled underground laborers such as miners or timbermen are paid $8.60 per 8-hour shift, unskilled underground labor $7.80, skilled surface labor $6.60, semi-skilled surface labor $5.20 and unskilled surface labor $4.50. Board costs $1.50 per day and rooms 25c. per day.

Over a period of six years, one of which the mine was idle, the production of coal has amounted to some 200,000 net tons, the average cost of which has been $6.50 per ton divided as follows: Investment, $1.20; maintenance and operation, $5.30. As compared with the coal imported from the States the Eska mine has saved the commission approximately a million and a half dollars and had the mine been operated continuously the total investment could be written off when the cost is compared with the price paid to private operators in the field.

Removing Coal from Under the Susquehanna River Where Cover Is Shallow

By Dever C. Ashmead*
Kingston, Pa.

IN MANY PARTS of the anthracite region and particularly in the Northern or Wyoming Field, much of the mining is under the Susquehanna River and what is known as the "Buried Valley." This latter is a prehistoric river valley that was filled with drift during the glacial period. As there is no drainage from the valley and as the Susquehanna River flows over the surface the glacial material is saturated with water and contains large areas of quicksand.

In consequence when any of the mine workings approach this valley or the river itself, great care has to be taken so that neither the sand nor gravel from the valley flows into the mines and that water from the river shall not come down through cracks that may extend from the mine to the surface. When the beds being mined are not near the surface the operations known as first mining are conducted in practically the same manner as usual and the percentage of coal extracted in that part of the work is as large as it would be if the river and the Buried Valley did not exist. Even second mining is now being undertaken in parts of the region where the beds are well covered by preglacial strata.

At one colliery the Red Ash bed, which is about 15 ft. thick, is being completely extracted directly under the Susquehanna River. The depth below the surface, however, is about 1,200 ft. Although this coal is being com-

*Now of U. S. Coal Commission.

FIG. 1

Mining Under Susquehanna

At the Cortright Slope of No. 14 Colliery of the Pennsylvania Coal Co., between Wilkes-Barre and Scranton, coal is extracted by pairs of headings 135 ft. apart. This is the first mining. After the coal is extracted the headings are rock-filled. Then the pillar is split by another pair of headings, which also are piled full of rock for fear that they might collapse after having been worked and might let in such a quantity of surface water as would close the mine. No pillars are drawn.

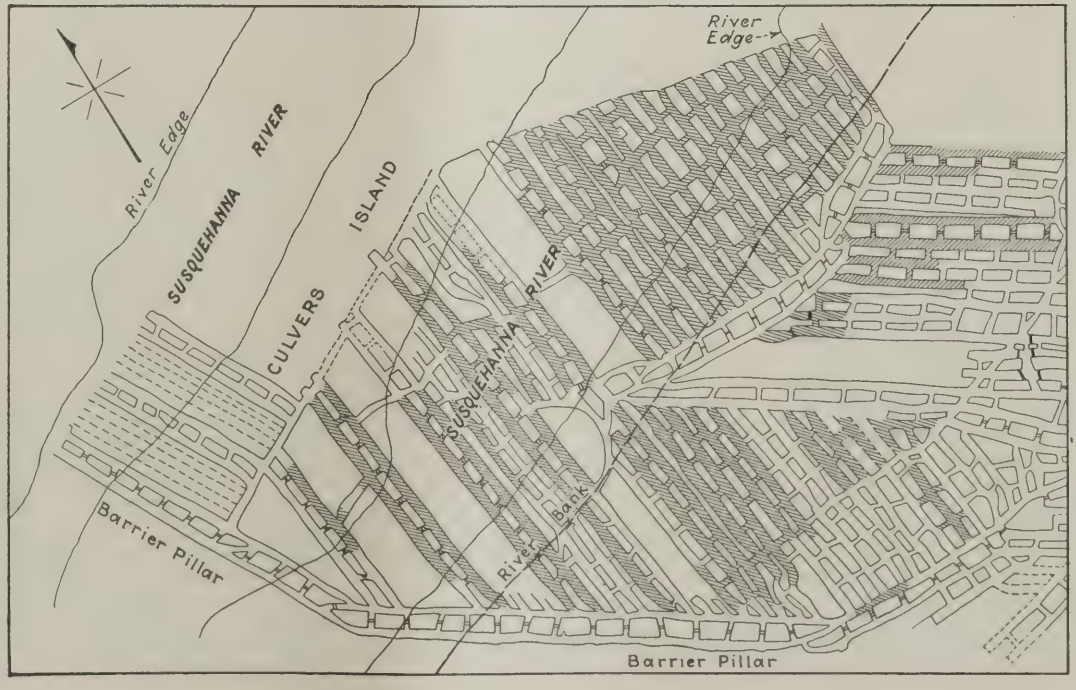

FIG. 2—FILLING HEADINGS WITH ROCK

Rock is brought in mine cars from the breaker, two miles away. Frequently rock barriers are built one by one across the heading, and loose rock is piled in behind them. The coal is over 7 ft. thick, so that in unloading the rock the unloader can get into the car as the man in the illustration has done. The coal rib shown on the left is lost, as is also that on the right also, which cannot be seen.

pletely taken out it is not thought that it will so seriously break the overlying rock that water will flow in from the river.

The greatest difficulty in mining in this vicinity is in the upper beds, where the cover rock is light, the coal of good quality, of reasonable thickness and too valuable to leave. Here great care has to be exercised in the mining so that the roof will not settle and cause cracks that will extend to the surface and permit the inflow of water or quicksand. If this were to happen the operation would have to be abandoned.

At the Cortright slope of No. 14 Colliery of the Pennsylvania Coal Co., between Wilkes-Barre and Pittston, the Hillman bed, which at this place is about 88 in. thick, is being mined. This seam extends under the Susquehanna River and it has only a comparatively light cover. The elevation of the surface of the river is approximately 517 ft. above tide and the elevation of the bottom of the coal is about 420 ft. at this particular point.

The bottom of the coal, however, shows elevations varying between 374 and 432 ft. At the borehole where the elevation first given was taken the wash and river constituted 62 ft. of the cover and the rock is only 25 ft. thick. This thickness of rock is inadequate so no mining can be done at this point. It is not considered safe to mine in places of this character if the rock is less than 50 ft. thick. One company, however, is working coal under a rock cover as light as 30 ft.

With as thin a cover as 50 ft. it is, of course, impossible to remove all the coal, for this would cause surface breaks and water would be admitted to the mine. But though complete extraction is scarcely possible, it is feasible to plan a method of mining that will permit a large proportion of the coal to be removed without danger to the men or the mine.

The method used by the Pennsylvania Coal Co. is distinctly different from that used by other companies in the anthracite region. The usual gangways are driven to develop the area. From these gangways parallel headings, or narrow rooms, as they would be termed in many mines, are driven in pairs and on 30-ft. centers. These headings are about 15 ft. wide, and the pillars are of the same width. They are driven to a maximum length of about 500 ft. When they have reached their limit they are filled with rock.

This rock is brought from the breaker of the mine, which is located about two miles away. It is transported in the mine cars which take coal to the breaker. The rock is unloaded from these cars and is packed by hand in the rooms. Walls are built at short intervals across the heading and then the rock is thrown back of these walls until it is filled to the roof.

These parallel room pairs are driven so as to leave between adjacent pairs a pillar of 75 ft. and when any two pairs have been driven to their limit and have been rock-filled, another pair of rooms is driven up between them, and when these are finished then these likewise are filled with rock. By this means it is possible to recover about 57 per cent of the coal from the bed, which is an unusually high percentage of recovery from beds of this character. Other companies which do not use rock-filling methods recover only a small percentage of the coal.

It readily can be seen from the illustration that in the first work of this character the recovery was not as great as it has been of late, for when the work was first commenced it was considered necessary to leave larger pillars, and it is probable that the recovery was only about 50 per cent.

Urge Fixing of Standards and Adoption of Net Ton in Coal Industry

Legislation which would fix certain coal standards is favored in a resolution adopted by weights and measures officials from the various states who met in Washington recently at their annual conference at the Bureau of Standards. The resolution pointed out that there are no definite specifications as to coal quality; that the heat values of the various varieties are unknown and that there is no general knowledge as to the effect upon coal when sheltered or exposed. It was the sense of the meeting that suitable action should be taken by Congress "to the end that an adequate legislative remedy be afforded the people of this nation by fixing the proper standards." The conference also recommended that the several states adopt as their standards those fixed by Congress or by its authorized agencies.

Another resolution adopted at the conference provides for the use of the net ton as the universal standard in the sale of coal. The fact that Pennsylvania uses the net ton for bituminous coal and the gross ton for anthracite was cited as indicative of the lack of system in handling the principal unit used in the coal trade.

The third resolution calls upon Congress and upon the legislatures of the several states to enact laws establishing the hundredweight as the unit rather than the bushel for the trade in vegetables, grain and similar commodities. The use of the bushel, it was declared, leads to confusion and presents constant opportunity for fraud. The entire abolition of dry measures was advocated. The conference elected the following officers to serve during the ensuing year: Dr. George K. Burgess, Director, Bureau of Standards, president; Wm. B. McGrady, chief, Pennsylvania Bureau of Standards, first vice-president; I. L. Miller, Commissioner of Weights and Measures for Indiana, second vice-president; F. S. Holbrook, Bureau of Standards, secretary; J. H. Foley, superintendent of Weights and Measures for New Jersey, treasurer. It was decided at this meeting to take up for discussion at next year's conference the whole subject of taximeters.

The tolerances for heavy duty scales recommended last year were adopted.

COAL PRODUCTION OF HUNGARY during 1922 was 7,117,910 metric tons or an average of 593,159 tons per month, as compared with 6,419,861 tons in 1921.

Determining What Is Most Economical Life for a Mine*

Too Much Spent on Some Mines for Maximum of Profit—Must Consider Not Only Net Earnings but What Sums of Money Would Earn Annuities Equal to the Several Net Earnings

By Frank Haas
Consulting Engineer, Consolidation Coal Co., Fairmont, W. Va.

CHOICE of this subject was prompted by observing that certain coal mines in Fairmont and other regions had been developed and equipped in a manner that suggested errors in judgment. These errors have not, except in a few instances, made themselves apparent by actual financial failures and some may never be so detected, but the losses of money are inevitable even if not readily perceived.

In the opening of a coal mine the question presents itself—although it is not always seriously considered—as to the amount that should be spent to obtain from the investments the best returns. During the war small economies were overlooked in frantic efforts to get coal and more coal, and some of the things that were done during that desperate period were both warranted and excusable, but in the times that are before us with the prospects that the margin of profit will be cut to a small figure, not only must strict economies be practiced in the operation of coal mines but the executive management in planning what shall be expended on them must likewise take advantage of all the economies that will lower the cost per ton.

We all know in a general way that if a coal property is worked out too rapidly certain losses occur, and the same is true if the process of extraction is extended over too long a period. It is the purpose of this paper to discuss some of the fundamental features which govern such economies and to explain the method of determining what are and what are not economies and to end by drawing some practical conclusions.

The problems involve many factors most of which are beyond control and cannot be anticipated; among these might be mentioned car supply, labor shortage and fluctuations in operating costs and in the selling price of coal. The effects of such variations are not, however, of a fundamental nature and may be disregarded in considering the subject from a theoretical standpoint. The fundamental features are the size of and price paid for the coal lands, the cost of the plant and equipment, together with the value of money as expressed in percentage rate of interest. In other words it involves only what are ordinarily termed the fixed charges.

An individual or a group of persons, having decided to enter into the industry of producing coal, usually has, or should have, a fairly clear and matured idea as to the magnitude of the project as well as a close approximation of what profit is anticipated. Without such preconceived ideas and anticipations one more hazard is being added to a business which by its nature already has many. The selection of the coal lands is the first consideration. In a region so intensively operated as the Fairmont field it is rather a case of what is available, hence the size of the coal field and the price paid is the controlling, if not the most important factor.

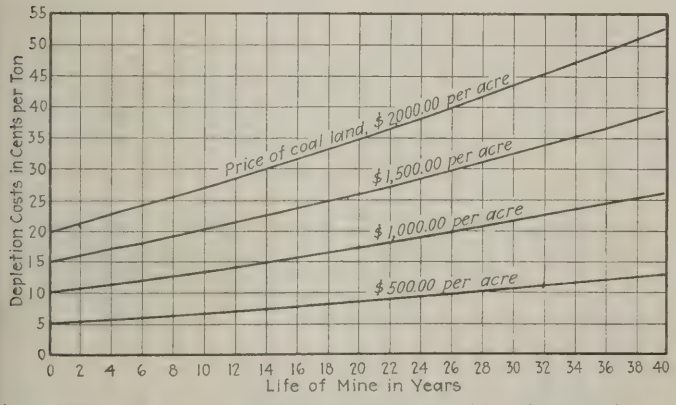

FIG. 1—COST PER TON FOR COAL ON LAND SELLING AT VARIOUS PRICES, ALLOWING FOR INTEREST CHARGES AND RETIREMENT OF CAPITAL

As the coal which is mined in the course of many years is subject to a heavy interest charge the cost of coal per ton increases with the life of a mine in years. If all of it could be taken out on the day of purchase the cost per ton would be the price of the coal land divided by the tons in it. Gradually mined out in forty years it will cost 165 per cent more. In making this diagram the product per acre was assumed to equal 10,000 tons, which is about what may be expected from the Pittsburgh seam in West Virginia.

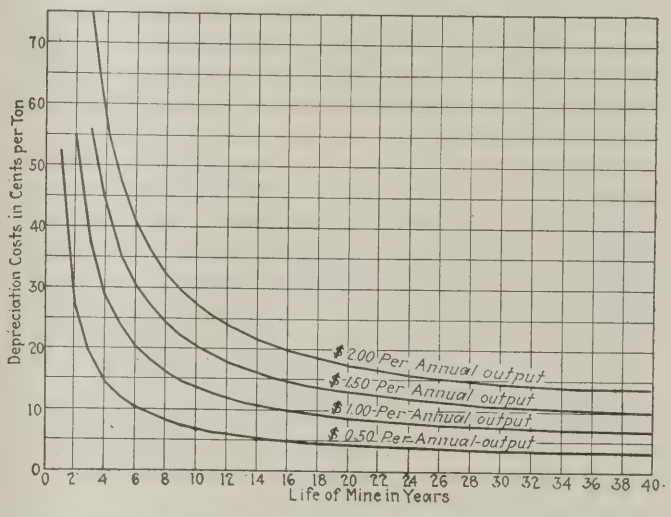

FIG. 2—COST PER TON FOR DEPRECIATION WITH VARYING CONSTRUCTION COSTS

Curves of depreciation run precipitately and then slowly but steadily downward with increased length of mine life, whereas the graphs of depletion as shown in Fig. 1 steadily rise.

We are now ready to discuss what effect the life of a coal field has on the cost of coal and ultimately its value. In Fig. 1 are shown some curves with the life of the mine varying from one to forty years and the cost per ton for different prices per acre of coal. The life of the mine is determined by dividing the recoverable coal by the average output of the mine. The costs per ton represent the charge that must be made to each ton of coal when mined to cover the original cost of the coal and to pay the interest charges at 6 per cent until such capital has been wiped out; these will be referred to as the depletion cost.

It will be seen at a glance that the longer the life the

*Article entitled "The Economic Life of a Mine," read at the West Virginia Coal Mining Institute, Clarksburg, W. Va.

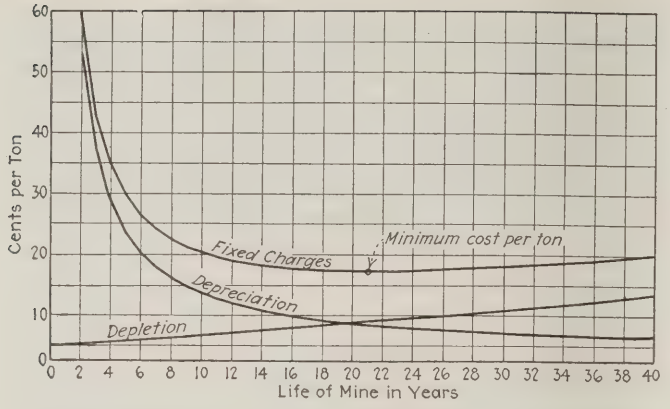

FIG. 3—DEPLETION AND DEPRECIATION GRAPHS TOTALLED FOR ANY ONE YEAR GIVE A CURVE OF FIXED CHARGES

The graphs shown here are those based on a value of coal land costing $500 per acre and a plant expenditure of $1 per annual ton. This is about one-eighth of the expenditure customary in anthracite mines. The minimum cost per ton is obtained with a life of twenty-one years but this is not the period that would give the greatest earning as further inquiry develops.

higher the cost per ton of coal, and if this was the only factor to consider there would be no problem. Before leaving these curves it might be well to point out some features which they illustrate, which while of no connection with the subject at hand, yet may be of interest. Each one of these curves represents an equivalent basis for royalty.

As the value of a lease depends on three factors, (1) the present value of the coal; (2) the term of years the lease will run and (3) the value of money, it is evident that by changing one of these factors either or both of the other factors must be changed. A person or corporation having decided to lease a coal property to an operating company would logically determine first what the present value of the property is, then would determine how long the lease is to run.

For instance, if they value their land at $500 per acre it would be immaterial to them whether they leased the coal for a term of forty years at a minimum that would exhaust the area within that time at a royalty of $0.1329 per ton or leased it for twenty years at double the minimum at $0.0872 per ton, or finally, sold it for cash at $0.05 per ton, assuming that it has a merchantable yield of 10,000 tons to the acre, as has the Pittsburgh bed.

Coming back to our original subject we find in depreciation, the second factor, more complications than in depletion. Considering but one object, improvement or machine depreciation is easily and fairly accurately determined, but in the total of plant and equipment of a coal mine we have a large variety of improvements and machines each of which has a specific life and therefore a different rate of depreciation.

To attempt to work out each item separately would be an endless task and while of value for other purposes is not necessary in these calculations. The subject of depreciation has been much discussed and greatly mystified by such terms as "replacements," "betterments" and "obsolesence" which have not been uniformly interpreted and have thereby caused confusion. Depreciation as we expect to use it in this discussion will be simply that the loss of the capital which has been expended on plant and equipment for the purpose of making them produce a certain output.

Taking "one ton per year" as our unit we find that we can determine with fair accuracy how much money must be expended to produce this tonnage. In the Fairmont region this sum varies from 50c. to $2. In other words if we attempt to build a mine to produce, say, 100,000 tons per year it will require $50,000 to $200,000 to accomplish this, depending on the natural facilities or obstacles encountered. Such things as betterments, replacements and obsolescence exist and care must be taken of them, so I suggest that they be considered as operating cost under repairs and supplies, and we have found that all these questionable features can be grouped and estimated as an annual charge of approximately 5 per cent of the original investment. It will cover all these items.

If this is a constant quantity it is immaterial whether it is included as depreciation or operating cost, and in order to simplify a problem which may to some seem complicated enough we leave it as the second. I am aware that with a small mine the purchase of a haulage motor, for example, would have a considerable effect on the cost sheet of a single month, but this could be handled in a suspense account over a period of a year instead of capitalizing it.

In Fig. 2 is plotted a curve which shows how the average cost of depreciation varies in mines of varying life. It will be noticed that on a short life this cost is prohibitive, but the curves drop off rapidly. The various points on the graph are determined by considering the depreciation charges as an annuity which, divided by the output corresponding to a particular life, gives the cost per ton. The tendency is directly opposite to that of depletion and the diagram plainly indicates that the longer the life the less the depreciation, or its cost per ton.

In Fig. 3 we take a particular case. With the value of coal at $500 per acre and the cost of the plant and equipment at $1 per ton of annual production I show both the depletion and the depreciation curve, and as the sum of these two is the total fixed charges I have added a third curve which represents this total. This curve shows a downward tendency at first but reverses the direction to an upward movement. Under the conditions assumed the minimum fixed charge is at a life of twenty-one years. The first impression is that as the cost is at its lowest with a life of twenty-one years this would be the period of greatest earnings, but this is not so, as will presently be shown.

With the selling price and all operating costs per ton known it is possible to determine the gross profits, and if we were to assume an arbitrary figure as representing the gross earnings (by gross earnings I mean the differ-

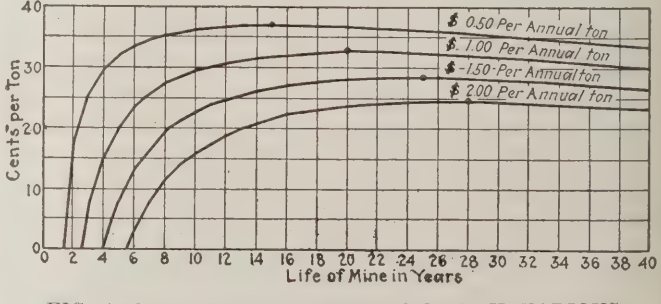

FIG. 4—NET EARNINGS PER TON WITH VARIOUS CONSTRUCTION COSTS AND MINE DURATIONS

This is based on a coal cost of $500 per acre and gross earnings of 50c. per ton with the fixed charges deducted. In a mine of short life on which much money has been expended, nothing remains of gross earnings after such deductions because they are so large. This is shown by the fact that all the curves rise from the base or zero line of the figure. In a mine of longer life the net earnings are larger.

ence between the selling price and all costs except the fixed charges) we can determine the net earnings and their relative value.

In Fig. 4 I have assumed a constant figure of 50c. per ton as representing the gross earnings and by subtracting from this sum the variable fixed charges I get a curve showing the net earnings per ton. On this diagram I am still holding to the assumption that the original cost of the coal is $500 per acre and have introduced four different costs of plant and equipment, 50c., $1, $1.50 and $2 per ton of annual production in order to show the effect of cost of plant and equipment on the economic life of the mine.

This series of curves shows conclusively, so far as annual earnings are concerned, that the economic life of a mine increases with the increased cost of plant and equipment. With an original cost of 50c. per annual ton for plant and equipment the largest average annual net earnings are attained with a 15-year life irrrespective of the size of the coal area and irrespective of cost of the coal per acre. For $1 equipment the life is twenty years; for $1.50 equipment it is twenty-five years and for $2 equipment it is 28 years.

We have previously intimated that the highest average earnings do not realize the highest value nor do they indicate the most economic life. The reason for this is that it is not only necessary to know how much money is to be earned but also just when it will be earned. In order to introduce this factor it will be

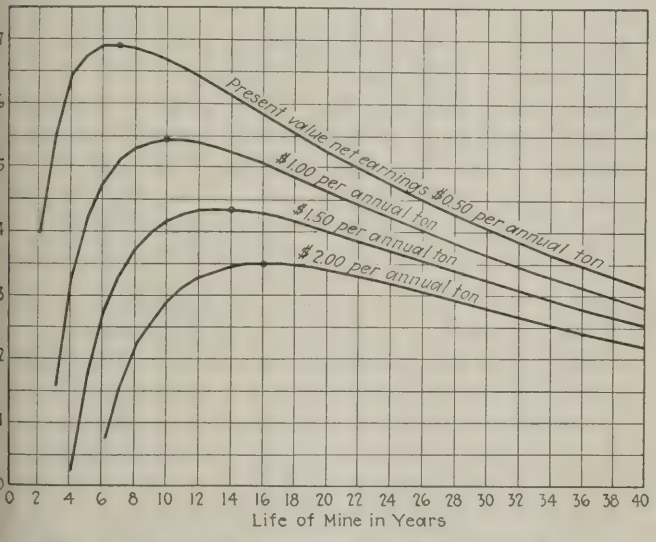

FIG. 5—PRESENT VALUE OF NET EARNINGS
This is based on four different rates of expenditure per ton of annual production with various lengths of mine life.

necessary to establish a fixed time and determine the value of each series of earning. The present time is the most convenient and we have constructed in Fig. 5 four curves which represent the present value of the net earnings.

It is seen in these curves that the most economic life is considerably shortened as compared to and indicated by the highest average earnings per ton. These curves, or rather the maximum points in these curves, give us the answer to our problem. For a mine costing 50c. per ton of annual output the most economic life is seven years. For $1 equipment it is ten years; for $1.50 equipment it is thirteen years and for $2 equipment it is sixteen years, all irrespective of size or cost of the coal field.

Having demonstrated the most economic life of a

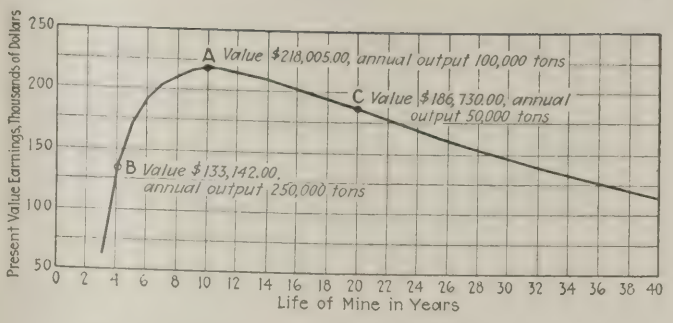

FIG. 6—PRESENT VALUE OF PRODUCT FROM THREE MINES
Here the total production over the life of the mine is 1,000,000 tons in each case. One is exhausted in four years, one in ten years and one in twenty years. According to the author's calculations the mine which is exhausted in ten years brings the greatest profits.

mine we will now attempt to show the practical effect and for this purpose we will assume that three men, indicated by *A*, *B* and *C*, each owning a tract of 100 acres of coal, for which they paid $500 per acre, with uniform conditions and operating cost and the selling price giving each the same gross earnings, and see what happens to them. *A* builds a plant and supplies equipment to produce 100,000 tons per year, which would give his mine a life of ten years. *B* puts in a plant to produce 250,000 tons per year with a life of four years and *C* puts in a plant for 50,000 tons per year, or a 20-year life. We find as indicated by the curve in Fig. 6:

A realizes a profit the present value of which is $218,005,

B a profit the present value of which is $133,142 and

C one the present value value of which is $186,730.

Therefore *A* makes practically 64 per cent more out of his property than *B* and 17 per cent more than *C*.

The above comparisons are no exaggeration; in fact greater variations can be found in the Fairmont field. What may to some appear merely a tendency really assumes large proportions and in extreme cases results in disaster from this cause alone.

ALL MEMBERS OF THE STAFF of the U. S. Geological Survey who are available for field work are now thus engaged. R. K. Lyn's party reached Kanatak, southwestern Alaska, June 7. A. I. Jonas is engaged in field work near Westminster, Md. Joseph L. Gillson, who is associated with Edward Sampson in the preparation of a report on the Pend Oreille district, Idaho, is in Washington to complete his part of the report. He will complete this work late in June, when he will join Prof. L. G. Westgate in the examination of the Pioche district of Nevada. Professor Westgate left Delaware, Ohio, for Pioche June 15. A. F. Melcher is continuing work connected with core drilling in the Burbank district, Osage County, Oklahoma. W. W. Rubey is at Moorecroft, Wyo., continuing work on the Black Hills rim. He is being assisted by Alexander Stepanoff. The headquarters of the Spieker party have been changed from Price to Huntington, Utah. Prof. C. R. Longwell, of Yale University, is at Las Vegas for summer field work. Dr. R. C. Moore has been assigned to work as geologist to the Grand Canyon surveying party in charge of C. H. Birdseye. J. B. Mertie, Jr., reached Alaska June 7. G. C. Martin left June 11 to visit some of the oil fields of California. On July 5 he will sail from Seattle to study the geology of the oil deposits of Alaska Peninsula.

THE CONFERENCE ON WASTE IN FREIGHT TRANSPORTATION which was to have been held this month in Washington under Commerce Department auspices has been postponed until such time that it will be possible to have a more representative attendance than could have been obtained on such short notice at this time when traffic men and others interested in transportation are particularly occupied.

Will Find What Makes Steel Castings Fail

THE Electric Steel Founders' Research Group held a regular meeting of executives of the five electric steel foundries conducting co-operative research work, at Wernersville, Pa., on May 14 to May 17. Those in attendance were W. J. Nugent, vice-president, Electric Steel Co., Chicago, Ill.; C. S. Koch, president and H. J. Koch, secretary, of Fort Pitt Steel Casting Co., McKeesport, Pa.; W. H. Worrilow, president, T. S. Quinn, treasurer, and K. V. Wheeler, general manager, of Lebanon Steel Foundry, Lebanon, Pa.; R. F. Flinterman, president and H. A. Neel, manager, of Michigan Steel Casting Co., Detroit, Mich.; C. R. Messinger, vice-president, E. J. Doty, vice-president, and B. Fleeger, treasurer, Sivyer Steel Casting Co., Milwaukee, Wis., and R. A. Bull, research director of the group.

The various phases of the research work being done by the members of the group to improve the quality of steel castings and increase efficiency in methods were discussed in detail. Formal reports giving the status of the present research investigations were read on such subjects as facing sand mixtures, core-sand mixtures, electric-furnace practice, heat treatment of steel castings, production control, porosity in castings, etc.

At this meeting plans were made for conducting research investigations into other problems of steel founders. The results obtained from the work done so far have been so beneficial as to make it highly desirable to study intensively some of the other complex problems involved in making electric steel castings of thin section and intricate design.

Small Cartridges Inefficient and Unsafe

EXHAUSTIVE tests on the action of explosives in use, when made into cartridges of small diameter, have just been completed by the U. S. Bureau of Mines. They prove that in the interest of safety, economy and efficiency in mining and other work small cartridges should not be used.

"One of the most serious and dangerous features in the use of explosives," says Dr. Charles E. Munroe, "is the frequency with which cartridges 'misfire' or fail to fire. Such cartridges must be eliminated."

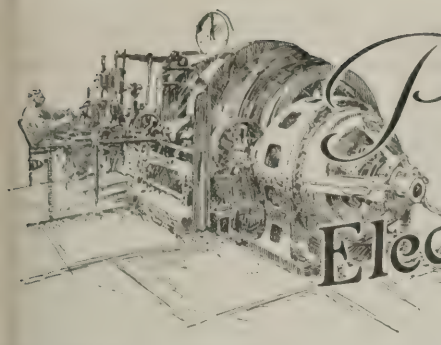
The growing use of high explosives by the general public, in addition to their use by the mining, road-building, and agricultural industries, brought about by the constant distribution of surplus war explosives, makes it necessary, Dr. Munroe believes, that the public become better acquainted with explosives and their use. Hundreds of thousands of pounds of dynamite, trinitrotoluol, picric acid, smokeless powder, and other similar high explosives have been and are being distributed throughout the country by the federal government, in order to use up the surplus materials left over from the war. Dr. Munroe has been one of the government's chief expert advisers concerning this distribution. He said:

"The bureau has found that the size of the cartridge used is vital if further economies, additional efficiency and increased safety are to be effected. The tests recently completed prove that we cannot get efficient work from an explosive when it is confined in a cartridge of small diameter. Heretofore, explosive users have believed that they could save money by making small holes and using cartridges of a size suited thereto. That has now been proved to be false economy.

"The bureau's tests prove that we can excavate more ground, blow up and take out more rock and stumps by making larger holes and using larger cartridges. They prove also that the customary and practically standardized cartridge, measuring in diameter 1¼ in. and in length 8 in., is small enough in the interest of safety. If it is made smaller, misfires may occur and 'duds' will be left around to be exploded at unexpected moments. For these reasons users of explosives must employ that size in the future."

Pennsylvania Mines Department Co-operates In Plan for Education of Coal Miners

By Frank Hall
Deputy Chief, Pennsylvania State Department of Mines



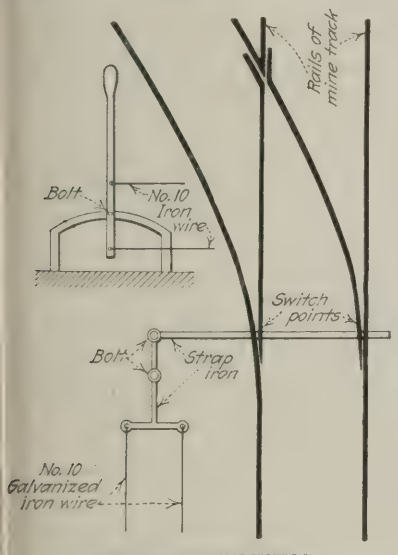
THE advantage of education in all lines of activity is daily becoming more apparent as the demands of modern business grow more exacting and more critical. But the scope of an education should not be limited to the specific things that pertain to a particular occupation; it should include also as much general knowledge as possible, for it is a truism that the better the education, other things being equal, the better will be the service performed.

The Department of Mines of Pennsylvania has found by experience that, even with the most stringent enforcement of the mining laws enacted by the state and the mining rules and regulations formulated by the operators, a large number of casualties occur in and about the mines that should be prevented.

The question naturally arises, What can be done to remedy this condition? One thing to do is to educate the mine workers. The mining department has always recognized this great need, realizing that an occupation so beset with dangers as coal mining is made more perilous by lack of knowledge and inefficiency. The agencies, such as the vocational schools, mining institutes, the Y. M. C. A. and the Scranton schools, have, therefore, all met with encouragement from the department, as they are practical in their methods of instruction and have proved to be a power in increasing the efficiency and carefulness of the mine workers.

The Department of Mines is at present co-operating with the Vocational Bureau of the Department of Public Instruction and the Mining Department of State College in the preparation of courses of study to be used throughout the state in the vocational schools, where miners receive instructions during the evening hours in all branches of the mining industry. The courses are being made comprehensive and include the most modern thought upon all subjects connected with coal mining; but they have been wisely kept in the simplest form possible so that they may afford thorough instruction without demanding too much effort on the part of the student.

The mining industry of Pennsylvania is so great that there always are thousands of men who are seeking, by educational means, to improve their condition, and it is expected that the courses now being prepared will bring to these ambitious workers an opportunity to acquire a fund of valuable knowledge that will enable them to seek with confidence higher and more responsible positions in and about the mines of the commonwealth. These men will be a potent factor in adding to the intelligent operation of the mines and in bringing about safer conditions for the mine workers.



Practical Pointers for Electrical and Mechanical Men

Simple Mine-Track Switch Thrower

WHERE it is desired to throw a switch when handling several cars, as is frequently the case in mine haulage, I have found the following arrangement very satisfactory and efficient.

A layout such as is shown in the figure herewith is used, which consists of merely lengthening the regular crossbar between the switch points and fastening a T-shaped piece of iron to the extended end by means of bolts. The T-shaped piece of iron must be pivoted so as to move freely from side to side. This may be accomplished by using a loosely fitting bolt. To the ends of the T-shaped piece of iron are fastened two iron wires. No. 10 iron wire usually is strong enough for the purpose. These wires are actuated by means of a hand lever arrangement as shown in the figure. This consists simply of a vertical piece of iron bolted to a frame. The wires from the T-shaped piece of iron are fastened as shown in the sketch. The upper part of this vertical iron is shaped to make the operation of the lever as easy as possible.

SWITCH-THROWING ARRANGEMENT

Considerable time may be saved by throwing the switch from the locomotive. Such an arrangement is safer than the usual method of kicking the latch over with the foot.

Considerable time may be saved by using this arrangement, as the switch may be thrown from the cars or locomotive without running to the switch points and kicking the switch over with the foot.

Tokay, N. M. CECIL ROWE,
Assistant Manager, Kinney Coal Mine.

To Overcome Smoke with Low-Volatile Coal

(1) The heat from low-volatile coal comes mainly from the red-hot incandescent coke and not from gas.

(2) To obtain constant heat keep about 75 per cent of the fuel bed in the rear red hot and generally from 8 to 12 in. thick.

(3) Throw green coal in the front part of the fire box, usually 8 to 20 in. high, for the purpose of coking it.

(4) While green coal is in the early stages of coking, smoke will be created, but in flowing over the very hot fuel bed in the rear it will be consumed and its valuable gases saved.

(5) When the green coal has given off practically all smoke, push it back and level off the fire bed.

(6) In a few moments repeat the process of coking green coal in the front as before.

(7) Do not permit black spots and holes to occur in the fire bed.

How to Get Best Results from a Battery

IN ORDER to assure best results the following condensed instructions have been issued for the use of Exide Ironclad batteries:

Care.—Solution in cells (the electrolyte) should always cover the plates. To replace evaporation, add pure water only, bringing level to bottom of filling tube.

Add water before a charge or immediately after starting charge. It should not be necessary to add water oftener than once a week. Otherwise the battery is being given too much charge or is too hot.

Never add acid to a cell, except in case solution has been spilled, then replace with new solution of same specific gravity as that of surrounding cells.

Filling plugs should be properly locked in place at all times, except when adding water or taking hydrometer readings.

Cleanliness of the exposed battery parts is very necessary.

If electrolyte is spilled or wood trays or compartment is damp with acid, apply a solution of cooking soda and water, then rinse with water and dry; do not allow soda solution to get into cells.

If this soda treatment is given two or three times a year and the battery kept clean between times by means of weekly washings with water or blowing off with a steam or air jet, the life and service of the battery in general and the trays in particular will be increased considerably.

Discharge.—In ordinary service do not use more than the rated capacity of the battery. In an emergency, take out all that it will give.

Charging.—A charge must always be completed at a rate not higher than about 1 amp. for each plate in a cell; for example, 15 amp. for a 15-plate cell.

A charge may be started at a high rate, provided the current is lowered and never exceeds the reading of the ampere-hour meter, until rate falls to about one ampere per plate.

The temperature of the cells must not exceed 110 deg. F. Open up battery compartment while charging.

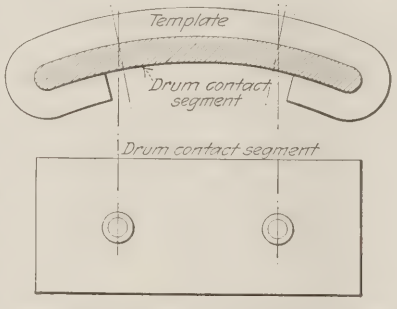
An equalizing charge must be given once a week. (See instruction book.)

Once a month, after an equalizing charge, take and

record the specific gravity of every cell. If the specific gravity is not between 1.250 and 1.285 notify the company.

Caution.—To avoid a possible explosion never bring a lighted cigar, match, open miner's lamp or other flame near a battery.

Never lay tools on top of a battery.



Always remove the covers from the battery box when charging.

Keep all parts of the battery clean.

For Detailed Instructions.—The instruction book gives complete information. Read it and obtain best results from the battery. For this book or other battery information, write to the company, specifying in what service the battery is used—whether in mine locomotive, industrial truck, street truck, etc.

Mine-Made Controller Segments

DRUM segments can easily be made in the mine shops. The diameter of the controller drum with the drum segments removed should be taken. This will be the inside diameter of a copper tube of suitable thickness, which, when cut up, will provide drum segments with the same curvature as those already in use. The copper tube may be purchased in lengths of a few feet, being placed in a lathe and cut into rings of the required width. These are then cut up as required. The drum segments should have their holes accurately drilled, and they should be interchangeable. Therefore it is best to make them in a template as shown in the figure. This can be made out of $\frac{1}{4}$-in. or $\frac{3}{8}$-in. iron. It should be shaped and drilled to a new drum segment supplied by the makers, the same one being kept as a standard. The template and drum segment should be the same width so that when the latter is inserted and entirely covered by the template the holes will be drilled in the proper location.

TEMPLATE FOR LOCATING THE HOLES IN CONTROLLER DRUM SEGMENTS

Accuracy in the location of the segments of the drum cylinder is important if arcing is to be kept at a minimum.

Drum segments of course burn on only one end, and therefore they should always be reversed in order to get out of them the maximum service. A spare set of these should be kept so that no filing is done in the controller.

When filing a drum segment the end should be properly rounded as shown in the figure. This insures a quick connection where the moving drum segment encounters the fingers. If they are filed at an angle as shown dotted, then contact is established and broken much more slowly, and burning is more severe.

R. F.—E.

H. F. YANCEY, assistant chemist, and Thomas Fraser, assistant mining engineer at Urbana (Ill.) experiment station of the Bureau of Mines, have completed a preliminary study taken to determine the amenability of coal to improvement by the dry-cleaning process. The distribution of the impurities in all of the coals was found to be such as to make them amenable to treatment by either the wet or dry process.

Determining Boiler Capacity and Requirements

DUE to the fact that the electric load at one of our mines has high peaks but of short duration, I am inclined to the belief that a very large boiler installation is hardly necessary. In proportion to the load I believe we are operating too many of our boilers. Much of the time we are working under the boiler horsepower rating. Will you kindly give me some information as to evaporating capacity of the average boiler per square foot of heating surface, the heating surface required per boiler horsepower and the possibilities of working boilers above their normal rating for short periods.

MINE PLANT OPERATOR.

The best efficiency under ordinary working conditions with most boilers, is obtained when evaporating about 3 lb. of water per square foot of heating surface per hour, from a feed temperature of 212 deg. F. into steam at atmospheric pressure. This is equivalent to allowing nearly 12 sq.ft. of heating surface per boiler horsepower.

However, at the present time 10 sq.ft. of heating surface ordinarily is considered the equivalent of one boiler horsepower.

In electric generating plants where the heat load is of short duration it is not particularly necessary to have the capacity of the boilers too liberal because most boilers may be pushed to 200 per cent load without seriously affecting their efficiency.

By dividing the total number of pounds of steam that are to be evaporated from and at 212 deg. F. per hour by 3 for fire-tube boilers and 3.4 for water-tube boilers, the amount of heating surface for plants with a constant load may be obtained with reasonable accuracy.

Plow Steel Rope for Mine Uses

FOR mine haulage, including endless-tail rope systems, gravity hoists, as well as coal-dock haulage and roads operating small grip cars a plow-steel transmission rope may be used to great advantage. When replacing a softer crucible steel rope where it is necessary to obtain increased strength and the physical requirements render it impossible to alter the working conditions a plow-steel rope may be used to distinct advantage. Under these conditions it is rarely necessary to increase the diameter of the rope.

A plow-steel transmission or haulage rope made up of six strands of seven wires per strand and having a hemp center has the following qualities when properly made:

Diameter in Inches	Circumference in Inches	Approximate Weight per Foot in Pounds	Approximate Strength in Net Tons	Proper Working Load in Net Tons	Diameter of Drum or Sheave in Feet Advised
1 1/4	4 3/8	3.55	82	16.4	11
1 3/16	4 1/8	3	72	14.4	10

PARTY LINES MAY BE DISAPPEARING in this country, but coal lines are forming.—*Brooklyn Eagle.*

How Many More Years Can Southwestern Coal Fields Keep Up Heartbreaking Fight Against Oil?

Lower Costs Are Vital Yet Unions Even Refuse 11c. Machine Differential—Coal Loses More Than 12,000,000 Tons of Market Among Railroads, Industries and Homes

By C. F. Butcher
Kansas City, Mo.

A MAN familiar with coal conditions in the southwestern district, one who has diagnosed afflictions of the industry with considerable accuracy in times past, has given the mines of Kansas, Oklahoma, Arkansas and Missouri "ten years more to live." In his opinion the industry is gradually succumbing to the high cost of production, and oil and electric competition. A cut in costs is a vital necessity.

It is a district capable of normal production of more than a million tons of coal a month with present equipment. At such a rate of production, in acreage now being developed, it should have a natural expectation of at least fifty years more of activity. It has undeveloped acreage estimated potentially to be good for from 300,000,000 to 600,000,000 tons additional. This is the Southwest's armor against exorbitant oil prices. It will always be ready to yield coal for every purpose. Yet there is no doubt of the sincerity of coal men who say the sun is setting on Kansas, Arkansas, Oklahoma and Missouri coal.

The "ten years" statement was repeated to many operators recently. Although not all are as pessimistic as that, they agreed that Old King Coal is a sick man at least as affects that part of his anatomy distributed over these four states. But, as one views the situation, it is well to bear in mind the admonition with which the general commissioner of the Southwestern Interstate Coal Operators' Association concluded a survey of conditions in the district for members of the association. "The coal industry," he wrote, "has in the past survived many adversities, and will no doubt be equal to the task of readjusting itself under these circumstances."

Note—Headpiece shows typical Oklahoma oil field, spiked with derricks, laced with pipe lines and spotted with field storage tanks from which main pipe lines carry oil to refineries any distance from 15 to 200 miles.

The high wage scale of last year remains effective for another year. Concerning the possible trend of wages or the stability of labor after the expiration of the existing contracts, no one will risk a guess. Operators attribute to present high operating costs much of the success of competitive fuels. And so far there is no sign of operators and miners coming closer together.

The other day a conference of representatives of operators and miners adjourned in Kansas City after arguing intermittently more than six weeks over a difference of 5c. in a machine scale differential for Kansas mines, where it is proposed to install machines. Operators offered an 11c. differential—the miners demanded 6c. About the time the conference adjourned, miners of Jackson-Walker mine No. 16, in the southeastern Kansas field, were petitioning Governor Jonathan Davis to force the company to resume work in the mine, which had been shut down because of lack of business. This indicates the attitude of union miners toward the obliteration of their jobs.

The competition of electricity is steadily increasing. In 1922 public-utility power plants produced and distributed an average of approximately 85,000,000 kw.-hr. of electric energy a month, while new projects are under way for centralizing the electrification of almost every town of 5,000 or more people in eastern Oklahoma, eastern Kansas and western Missouri into a dozen or so large power plants. In addition to making it possible to substitute electrical energy for steam in many plants now using boilers, engineers for the interested power companies estimate that centralization will effect a reduction of 20 to 25 per cent in the amount of fuel required for their plants.

And finally, there is the constant encroachment of fuel oil upon the coal market. Immediately before,

"TANK FARM" IN THE CENTER OF A GREAT SOUTHWEST PRODUCING FIELD

Here oil is collected by millions of gallons for general field storage on its way out of the region via one of the several main pipe lines. The bulk of the oil shipped out of the Southwest field never uses a tank car nor does it clutter up a railroad en route.

during and since the war, oil production in the mid-continent field has grown by leaps and bounds. Great new fields have been opened in Oklahoma, Texas, Arkansas and Kansas. A network of pipe lines has been laid over the states, affording economical transportation to refineries and loading points. No strikes have occurred in the oil fields to tie up production, and selling agencies have not overlooked the argument afforded by this fact in seeking replacement of grates by oil burners.

Before the war, oil competition was negligible. There was some experimentation, but for the most part such plants as installed oil burners vacillated from coal to oil and from oil back to coal with the fluctuations in price of the two fuels. During the war there was such a demand for all forms of fuel that no effort was made to tabulate the comparative popularity of the various types. It was not until the autumn of 1919 that any attempt was made to discover the relative positions of coal and oil in the Southwest. At that time, W. L. A. Johnson, general commissioner of the Southwestern Interstate Coal Operators' Association, requested from all coal-selling organizations of the Southwest the names of their customers who had replaced grates with oil burners and the amount of coal displaced in each plant. The replies to the query, as submitted to the Bituminous Coal Commission in Washington, D. C., early in 1920, revealed that in 385 establishments, including both industrial plants and railroads, 12,484,750 tons of coal a year was being displaced by fuel oil. Displacement in industrial plants was 5,881,900 tons and on railroads 6,602,850 tons. No survey has been made since, but there has been a steady increase in displacement in the last two years.

In considering these returns it must be borne in mind that they are for ten states, and embrace territory supplied only in part by mines of Kansas, Arkansas, Oklahoma and Missouri. Even so, the total is startling, exceeding as it does the total production of coal in the four states in either 1921 or 1922.

In Kansas City alone in 1922 oil displaced some 695,000 tons of coal. Of this displacement, approximately 542,000 tons was industrial, 153,000 tons domestic. On May 1, 1922, there were 9,220 oil burners in Kansas City domestic heating plants. Now there are in the neighborhood of 15,300. This increase in the summer of last year is attributed largely to the uncertainty of labor conditions. The public had no assurance that the strike would be settled before winter. It had had previous experience with "coal famines" produced by labor troubles and with prices prevailing at such times. The skyrocketing of prices on such coal as was obtainable in the summer augmented its fears.

So with industries. Rather than risk a shut-down for lack of fuel, many companies installed oil burners.

Railroads are converting virtually all their divisions south and southwest of Kansas City to oil. Almost every railroad of the Southwest and the middle South taps one or more of the scores of immense pools of Texas, Arkansas, Oklahoma and Kansas. Transportation costs are reduced by the proximity of the lines to the fields. Within a few months the southern divisions of the Frisco, Katy, Rock Island, Santa Fe., Missouri Pacific, Southern Pacific, Kansas City Southern and Cotton Belt all will be using oil exclusively. All roads in Texas already are using only oil.

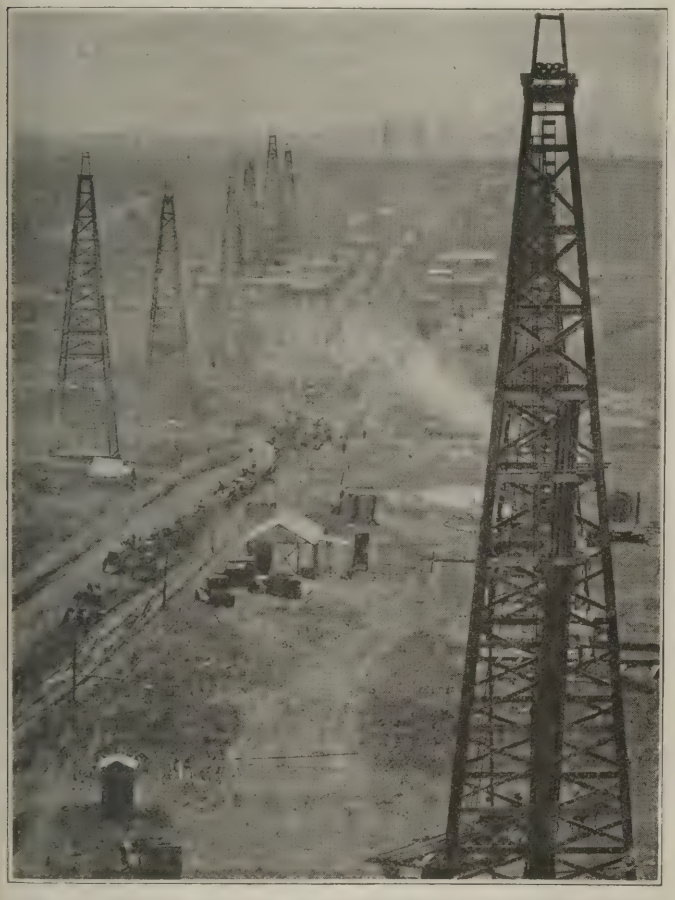
It is considered probable that the Southern Pacific will install oil on its transcontinental lines. It has contracted for the erection of a steel storage tank at Lordsburg, N. M., that will have a capacity of 2,500,000 gallons. A recent contract made by the Missouri Pacific with the Great American Oil Co., to run three years, provides for oil to be used on all southern divisions of the system. The company will erect twenty-three 55,000-barrel steel storage tanks, and expects to equip 100 locomotives with oil burners, at a cost of $200,000.

The Cotton Belt recently contracted with the Houston Oil Co. for 4,000,000 barrels of fuel oil to be used at the rate of 10,000 barrels a day. It is equipping 119 locomotives with burners, and is building storage tanks with a capacity of 500,000 barrels. The Frisco has a three-year contract for fuel oil to be used on its Southwestern lines. The Rock Island recently announced its intention to convert all locomotives to oil, and to close its mines in Hartshorne and Haileyville, Okla., until the cost of producing coal is reduced. The Katy is burning oil in all engines running between Parsons, Kan., and Denison, Texas, and in its shop boilers at Parsons.

These changes entail a coal-market loss of approximately 30,000 tons a day.

As to comparative costs of the two fuels there is no agreement. Purchasing agents for companies using coal say coal costs less to use than oil. Those for plants burning oil swear oil is the cheaper—that the greater initial cost and the expense of substituting burners for grates is offset by a cheaper handling cost. Most home owners who have substituted oil for coal agree that, in addition to the cost of necessary changes in their heating plants, their oil bills run from 20 to 25 per cent greater than did their bills for Arkansas

IF COAL MINING SPOILS LANDSCAPES, WHAT DOES OIL MINING DO?



This countryside yielded its every claim to beauty and devoted itself to raising this crop of derricks and hulking odorous tanks which help to keep pipelines full and give the producer a chance to keep his wells pumping even though the demand may be slack.

TABLE I—INCREASE OF ELECTRIC POWER GENERATED IN THE SOUTHWEST WITH AMOUNTS OF FUEL CONSUMED *

Year	Kw.-Hr. Produced by Water	Kw.-Hr. Produced by Fuels	Fuels Consumed — Coal, (Net Tons)	Oil, (Barrels)	Gas, (M. Cu.Ft.)
ARKANSAS					
1920	1,373,000	117,337,000	123,019	83,816	2,698,740
1921	1,438,000	123,014,000	128,539	155,355	1,954,493

OKLAHOMA					
1920	2,006,000	211,822,000	102,072	345,685	5,608,484
1921	2,343,000	212,275,000	70,029	552,308	4,503,294
1922	5,337,000	238,756,000	61,176	507,140	4,547,636

* Based on returns from plants producing 10,000 or more kw.-hr.

semi-anthracite, the domestic coal most generally used in Kansas City. "But," they explain, "there are no strikes in the oil fields. We know we can get fuel oil

THE KLONDIKE RUSH HAD NOTHING ON A RUSH FOR OIL

When a strike is made a new field sprouts up overnight. Roads begin to run oil, machinery, tanks and pipe. Shacks are thrown together, gangs throng in from everywhere and nowhere, drills bore day and night, everything is forgotten by oil men except that a pool of oil is right there under their feet and that the first man into it begins to cash in first. Reckless waste marks every move.

as long as the railroads run." This likewise is the reason most frequently heard among industrial buyers for converting to oil.

And yet last autumn, as soon as it became apparent that the labor situation in the coal fields was more or less stabilized, several plants which had been using oil during the months of uncertainty returned to their grates. Among them was the Armour packing plant, one of the largest industrial fuel buyers in Kansas City.

As this is written fuel oil is quoted by the tank car, f.o.b. Oklahoma shipping points, at $1.15 a barrel.

COAL MINE TOWNS SHINE BY COMPARISON

While of course there are oil companies which build comfortable houses for employees, the footloose oil man must hop around suddenly from place to place, and his home usually is a shack like one of these. The wooden box in the foreground has a "Rooms for Rent" sign on it.

Kansas coal, f.o.b. mines, is $4.50 for lump, $4 for nut, $3.50 for mine-run, and $2.50 for screenings. Taking 4½ barrels of fuel oil as the equivalent of one ton of Kansas bituminous in B.t.u. value, it is apparent that oil to do the work of one ton of coal would cost $5.175.

Electricity forms the third point of the competitive fuel triangle. But, whereas its participation in the competition is more or less simple, electric power itself provides a market for which its two competitors must struggle. And although each month the U. S. Geological Survey publishes statistics on the number of kilowatt-hours produced by water power, and by various fuels in each state, engineers refuse to attempt to estimate the amount of fuel displaced by a specified number of kilowatt-hours of electrical energy. Such a compilation, they say, would be affected by too many unstable factors to be made to apply generally through all industries. It would vary for each plant.

Table I, taken from the Geological Survey, does show, however, a steady increase in the production of electrical energy in the four states in the last three years accompanied by a steady increase in oil burned to generate electricity and a decrease in coal consumed for

THE "TIPPLE" OF THE OIL INDUSTRY

About 500 refineries of various sorts raise their distilling columns in air in various large communities near the oil fields. Here the gasoline and gas oils are removed, leaving approximately 20 per cent of the original volume, which is fuel oil.

the same purpose. It further illustrates the magnitude of the power-plant market for oil and coal, and the quantities of each used.

From the first two columns of Table I may be obtained an idea of the steady increase in production of electrical energy during the three years. From the third and fourth columns are obtained the figures on the increase or decrease of the use of coal and fuel oil in power plants shown in Table II. It will be noted that the minus signs are in the majority in the coal column, the plus signs in the oil column. This is especially significant in view of the fact that oil men say power-plant reports may be taken as a fairly accurate gage of the relative popularity of the two fuels in other industries of the district.

TABLE II—INCREASE OR DECREASE IN AMOUNT OF COAL AND FUEL OIL CONSUMED BY PUBLIC UTILITY-POWER PLANTS

Year	Coal (Tons)	Oil (Bbls.)

Research Fellows Study Dust Explosions, Heat Conductivity and Stray Current

A STUDY of the factors causing mine explosions will be made at Carnegie Institute of Technology. The study of mine-explosion causes will be divided into investigations of (a) modification of Stokes law for settling of coal-dust particles; (b) time-pressure relations in dust explosions; (c) conductivity and specific heat of coal; (d) static charges in coal mines; and (e) effect of electric field in propagation of explosions.

Six college graduates will be appointed to research fellowships to conduct the investigations in co-operation with the U. S. Bureau of Mines and an advisory board of Pittsburgh coal operators and mining engineers. September, 1923, will mark the beginning of the third consecutive year that the Department of Co-operative Mining Courses at Carnegie Tech. will devote to mine research.

Other subjects for investigations during the coming year will be geology, acid mine waters, coal mining, coal washing, utilization of coal, safety and efficiency, and coal storage. The results of the work will be published at the end of the ten months devoted to it.

Magnitude in Anthracite Mining Operations

FROM President Loree's remarks at the banquet in celebration of the centennial of the Delaware & Hudson Co. it may be possible to get some idea as to the large quantities of material used and of the magnitude of the work performed at anthracite collieries. As he well says:

"Some of the mechanical measurements are startling. This company elevates to the surface 14 tons of water for each ton of coal that is prepared and sent to market from its mines. The mine tracks, underground, in its collieries, have a combined length of 650 miles, or more than two-thirds the length of the great railway system that has been developed incident to the marketing of the coal. Each miner is a shipper, who must have several mine cars delivered one at a time during the day, and 20,000 of these cars have been loaded and unloaded in one working day.

"Anthracite is recovered from ten to twelve superimposed beds at a single operation, each bed extending over an area of from 8 to 10 square miles, making a total of from 80 to 120 square miles for one colliery operation. Owing to the greater depth of anthracite mines and the complicated and costly apparatus required in the preparation of hard coal, the present cost of a new operation capable of an annual output of 1,000,000 tons is about $8,500,000 for the anthracite region, whereas in the bituminous fields the average cost of a plant capable of similar output would be approximately $2,500,000."

Bituminous Movement to Tidewater in May Exceeds That of March and April

Soft coal moved through North Atlantic ports in May, according to the U. S. Geological Survey, totaled 3,731,000 net tons, as compared with 3,366,000 tons in April and 3,315,000 tons in March. Each of the ports shared in the increase. The total shipments and the quantity of coal exported in May were larger than at any time since the summer of 1921. Coastwise shipments to New England decreased.

TIDEWATER BITUMINOUS COAL SHIPMENTS FOR MAY, 1923
(Net Tons)

Destination	New York	Philadelphia	Baltimore	Hampton Roads	Charleston	Total
Coastwise to New England	182,000	115,000	114,000	718,000	.....	1,129,000
Exports	1,000	74,000	329,000	405,000	38,000	847,000
Bunker	250,000	45,000	65,000	182,000	5,000	547,000
Inside capes	.....	198,000	180,000	32,000	.....	410,000
Other tonnage	565,000	.....	9,000	219,000	5,000	798,000
Total	998,000	432,000	697,000	1,556,000	48,000	3,731,000

Retail Anthracite Sales in Massachusetts Fell Off 20 Per Cent in 1922-3

Distribution of domestic anthracite by the retail dealers of Massachusetts fell off 1,100 000 tons, or about 20 per cent, in the coal year 1922-1923 as compared with the previous coal year. The detailed figures, in net tons, including the monthly receipts shown below were compiled by the Massachusetts Special Commission on the Necessaries of life:

Stocks on hand April 1, 1922	726,611
Receipts, April, 1922	226,312
May	98,801
June	97,668
July	70,847
August	46,871
September	95,059
October	449,681
November	449,853
December	472,777
January, 1923	476,169
February	472,210
March	609,627
Available for distribution	4,292,486
Stocks on hand April 1, 1923	181,887
Distributed in year	4,110,599

Stocks in the dealers' yards on April 1, 1923, were considerably less than in previous years, as shown below:

Stocks on hand in dealers' yards, in net tons:

April 1, 1920	342,925
April 1, 1921	803,029
April 1, 1922	726,611
April 1, 1923	181,887

Receipts of anthracite through the New England rail gateways show 458 cars per day during April to the 23rd. The daily average receipts of anthracite in the 1921-1922 coal year through these gateways was 417 cars per day.

ALMOST ANY SYSTEM of government will work if the people will.—*Springfield State Register.*

West Virginia Mining Institute Discusses Mine Development, Fires and Housing

Many interesting papers were read at the twenty-seventh semi-annual meeting of the West Virginia Mining Institute held in Clarksburg on June 12, 13 and 14, over which Professor A. C. Callen, of Morgantown, head of the department of mining engineering of the West Virginia University, presided. Hugh G. Scott of the Smith Bros. Coal Co., of Clarksburg, delivered the address of welcome, response to which was made by J. B. Hanford, of Morgantown, president of the institute when first organized in Clarksburg about 15 years ago.

J. W. Knowlton, chief of the testing department of the West Virginia Coal & Coke Co., of Elkins, read the first paper entitled: "What the Future Holds for Coal." Mr. Knowlton in his address said that the difference between prosperity and business depression is only 10 to 20 per cent instead of 100 per cent as many were inclined to believe.

He expressed the opinion that there was no need for the opening of additional mines, stating that there were sufficient plants to meet the needs of the present and the immediate future. He said that was especially true in this age of the utilization of coal when central power plants and byproduct plants are employed to utilize fuel to its greatest extent. Mr. Knowlton thought that the principal problem to be solved in the future was that of transportation and that the main difficulty in obtaining our fuel supplies would lie not so much in the mining as in the moving of coal.

An interesting paper on "The Economic Life of a Coal Mine" was read by Frank Haas, consulting engineer of the Consolidation Coal Co. of Fairmont. His paper was of a technical nature and appears on another page in this issue of *Coal Age*.

In reading a paper on "Informing the Consumer as to the Hazard and Expense of Coal Production," Captain W. J. German, technical representative of E. I. du Pont de Nemours & Co., of Huntington, contended that the coal industry should let the general public know more of the various hazards and expenses entering into the costs of producing coal. Captain German illustrated what he meant by saying that he had had occasion to ascertain in Chicago not long ago just what the public knew about coal mining. The answers he had received disclosed the fact that people in general were under the impression that coal lies in thick deposits and that all the work to be done was to dig it and roll it into railroad cars.

Dr. C. L. Jones, of the Mellon Institute of Pittsburgh, talked of entirely new methods in fighting mine fires in a paper on "Fighting Mine Fires with Carbon Dioxide." He mentioned the fact that the coal in the Bitner mine of the H. C. Frick Coke Co., near Connellsville, Pa., had been burning fully two months before the fire was checked by resorting to the use of carbon dioxide. He also stated that those connected with the company have expressed the belief that the fire could not have been extinguished if carbon dioxide had not been utilized.

Dr. Jones described how stoppings were built and the entire area sealed. Then carbon dioxide was injected through boreholes through which water was forced to extinguish the flames. It was stated by Dr. Jones that 230,000 lb. or the equivalent of 4,600 tanks which hold 450 cu.ft. of carbon dioxide were used in the successful drive to extinguish the mine fire. He said that the success of the treatment at the fire described has been due to sealing off the area of fire; cooling the temperature of the area by means of water; the smothering effect of carbon dioxide and the fact that the gas to a certain extent prevents the inflow of outside air to the fire area during the period of contraction.

Other papers read at the meeting were "Housing the Coal Industry," by L. Brandt, of Pittsburgh; "The Low Temperature Distillation of Coal," by R. D. Lamie of the Huntington Coal Distillation Co., of Huntington; and "Where to Build Our Mining Towns," by Thomas F. Downing, Jr., general manager of the Lundale Coal Corporation, of Lundale, W. Va.

Production of Byproduct and Beehive Coke Continued to Gain in May

Output of byproduct coke in May, according to the U. S. Geological Survey, was 3,328,000 net tons, an increase of 122,000 tons, or 3.8 per cent, over the April output. This gain was partly due to the greater number of working days and partly to an increase in the average daily rate of production. The quantity of coke produced was 89.2 per cent of the capacity of plants in existence. The total count of plants is now 69, two formerly reported separately having been consolidated. Of these, 63 were active and 6 idle.

The production of beehive coke also increased in May. The output was 1,829,000 net tons, as compared with 1,776,000 tons in April. Thus the total output of all coke was 5,157,000 tons, of which byproduct coke constituted 64.5 per cent and beehive coke 35.5 per cent.

MONTHLY OUTPUT OF BYPRODUCT AND BEEHIVE COKE IN THE UNITED STATES(a)
(In net tons)

	Byproduct Coke	Beehive Coke	Total
1917 Monthly average	1,870,000	2,764,000	4,634,000
1918 Monthly average	2,166,000	2,540,000	4,706,000
1919 Monthly average	2,095,000	1,638,000	3,733,000
1920 Monthly average	2,565,000	1,748,000	4,313,000
1921 Monthly average	1,646,000	462,000	2,108,000
1922 Monthly average	2,374,000	669,000	3,043,000
March, 1923	3,256,000	1,749,000	5,005,000
April, 1923	3,206,000	1,776,000	4,982,000
May, 1923	3,328,000	1,829,000	5,157,000

(a) Excludes screenings and breeze.

Coal consumed in the manufacture of coke in May is estimated at 7,667,000 net tons, of which 4,782 tons was used in byproduct ovens and 2,885,000 tons in beehive ovens. The following table presents for comparison the average monthly consumption of coal for coke-making during the past six years.

ESTIMATED MONTHLY CONSUMPTION OF COAL FOR MANUFACTURE OF COKE a
(In net tons)

	Consumed in Byproduct Ovens	Consumed in Beehive Ovens	Total Coal Consumed
1917 Monthly average	2,625,000	4,354,000	6,979,000
1918 Monthly average	3,072,000	4,014,000	7,086,000
1919 Monthly average	2,988,000	2,478,000	5,466,000
1920 Monthly average	3,684,000	2,665,000	6,349,000
1921 Monthly average	2,401,000	706,000	3,107,000
1922 Monthly average	3,411,000	1,056,000	4,467,000
March, 1923	4,679,000	2,759,000	7,438,000
April, 1923	4,607,000	2,801,000	7,408,000
May, 1923	4,782,000	2,885,000	7,667,000

(a) Assuming a yield in merchantable coke of 69.6 per cent of the coal charged in byproduct ovens and of 63.4 per cent in beehive ovens.

Railroad Reports Show Amount of Coal Carried by Roads Last Year

The following statistics from annual reports of railroads give the coal and coke freight tonnages moved by the carriers during the calendar years 1921 and 1922. Originating tonnage as well as that received from connections are included in these totals, which are all in gross tons.

	Anthracite		Bituminous		Coke	
	1922	1921	1922	1921	1922	1921
N. Y., N. H. & H.	2,026,680	3,433,352	3,926,888	3,475,663	210,337	126,393
Long Island R. R.	1,358,558	1,754,093	350,790	285,625	22,436	13,941

Problems of Operating Men

Edited by James T. Beard

Disposal of Slate Refuse When Working Twin Coal Seams

Complete Extraction of Coal a Controlling Factor —Method of Working Adopted an Important Consideration — Advantage in Longwall Plan

IN TWO recent articles that appeared as Inquiries in that department of *Coal Age*, attention has been drawn to the economic disposal of slate refuse. The first of these inquiries appeared in the issue of April 12, p. 608, under the title "Gobbing Slate in Rooms in Mines." The second is found in the issue of May 10, p. 762, under the title "Working Coal Seams With Heavy Slate Parting."

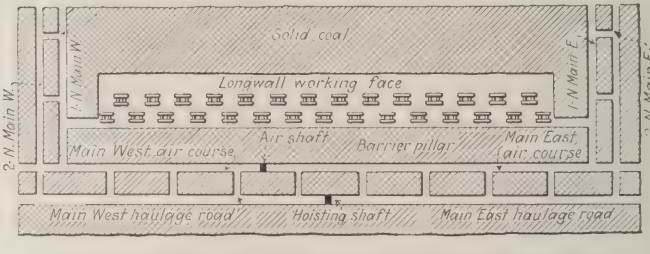
In treating this question, due regard must be had to the efficiency of the operation; but probably the controlling factor is the complete extraction of the coal made possible by the method of working adopted. Assuming that the gob is thrown back into the waste, as the rooms are driven up in the first working, unless particular care is taken in the stowing of this refuse, it will often hinder the extraction of the pillars. If it becomes necessary to move a portion of the refuse, the extraction of the pillars will be made more difficult and much coal will then be lost.

It is this consideration that makes me say that the complete extraction of the coal may often prove the controlling factor in the matter of the disposal of the waste, especially where there is much of that material to handle, which is no doubt the case in the mining of twin seams of coal separated by 30 in. of slate parting, as stated in the second inquiry mentioned.

New Methods Needed to Eliminate Waste

Looking to the future of coal mining and the limitation of our natural resources, in this particular instance, operators view with increasing uneasiness the question of waste in the mining of the coal. While many are loath to leave the old-established methods of mining and adopt another plan than that with which they are acquainted, the fact is becoming more generally realized that other methods of working will often give increased efficiency and eliminate much waste of the coal.

This remark applies particularly to the hesitancy in abandoning the common room-and-pillar method of working and adopting in its place the longwall method.



In that respect, let me suggest that the longwall method of working is far superior to the room-and-pillar method, in reference to securing the complete extraction of the coal where there is much refuse to handle, as appears to be the case in each of the inquiries here mentioned.

In regard to working the two seams of coal mentioned by the second inquirer, the seams having a thickness of 52 in. and 30 in., respectively, and being separated by 30 in. of slate parting, I have prepared and beg to submit a diagram giving an outline of the plan I would adopt.

The accompanying figure shows the main entries and air-course driven east and west from the hoisting shaft and the air shaft, respectively. On the right and left of these shafts, two pairs of cross-entries are driven, leaving a pillar of solid coal, 50 or 100 yd. in width, as may be desired or the conditions may permit.

Starting the Longwall Working Face

Both the main headings and the cross-entries are flanked with barrier pillars of sufficient thickness to protect them from squeeze or creep. The work of opening out a longwall face is now started by driving a cross-heading just behind the barrier pillar left for the protection of the main air-course. The inby rib of

PROPOSED PLAN OF LONGWALL PANEL WORKING

this cross-heading will then form the longwall face, the advancing method being employed in order to give earlier returns on the investment.

All entries should be driven just wide enough to hold up the slate or "middleman," as it is called, and prevent its falling on the roads. If possible, this width should be great enough to avoid the payment of yardage in driving these entries. My plan would be to use a 7-ft. machine for mining the coal, driving hardwood wedges under the coal, behind the cutting machine.

Supporting the Roof by "Chocks" or "Nogs"

For the protection of the men at the working face, I would build a line of "chocks" parallel to the face of the coal and at such a distance from it to permit the passing of the machine. As the work advanced, I would build a second row of chocks between the first row and the face of the coal. These chocks should be staggered in checkerboard form.

When the third cut has been made across the face, it would be time to withdraw the rear row of chocks; but this must not be done all at once. I would follow the plan of having enough material for building an extra chock at the face, before withdrawing the corresponding chock in the rear row. The chock then drawn should be used at the face and placed in position there, before withdrawing a second chock in the rear row. This plan should be followed the entire length of the longwall face.

These chocks or "nogs," as they are sometimes called, should be of hard wood, 8 in. square and 2 ft. 8 in. long, built up in log-cabin style. In order to make the task of withdrawing the chocks easier, the first course should be laid on from 3 to 6 in. of bug dust that can be easily picked out when removing the chock. The distance apart of setting the chocks, center to center, will depend on the conditions of roof and floor and will vary from 3 to 6 yd.

While this method may seem costly at first, it will generally prove a saving of time and money in the end. It also serves to make the men feel that they are safe, which is an important item in the successful operation of a mine, particularly when starting a new method of working unfamiliar to the men.

Longwall Affords Room for Stowing Waste

In closing, let me say that one of the chief advantages obtained in the adoption of the longwall method of mining is the opportunity afforded for the handling of the waste material, which is the chief concern of the inquirers to whom I have previously referred. All such waste material can be economically used in the building of good packwalls, which take the place of the timber required in the room-and-pillar system of working. With sufficient capital, it is a good plan to push the cross-headings to the boundary and open out the longwall face at that point and extract the coal on the retreating plan.

My experience has taught me that the longwall plan of mining coal, under conditions that favor the method, has the advantage of affording greater safety, efficiency and economy than the room-and-pillar method of working. If mine operators could only assume a perspective view, comparing these two methods of working, in mines that have been operated say ten years, under 500 ft. of cover and normal roof conditions, the result would convince them of the many advantages of the longwall method, which requires less timber, less deadwork, fewer mine fires and a lower cost of production, per ton of coal mined, than is possible by the other method.

Linton, Ind. W. H. Luxton.

Can Mine Explosions Be Prevented?

Why a mine becomes dangerous—Investigation of numerous explosions has always revealed some one's mistake—Need of closer supervision—Strict discipline insures safety in the mine.

THE records of the last few months have made the subject of coal-mine explosions one of deep interest. There is a reason for everything and explosions in mines are no exception to the general rule. A person loses his health because of continued disregard of the laws of hygiene. In the same way, a mine becomes dangerous because the management are disregardful of the laws of safety.

Indifference to the little bad practices of mine workers, or the known bad conditions of any portion of the workings in a mine, on the part of the management, breeds contempt for the finer points that make for safety in its operation. According to the laws of probability, disaster will take its toll sooner or later, depending on the extent to which the standards of safety are esteemed and supported by those who are in responsible charge of operations.

A little reflection impresses one that long time has been required to bring man to his present state of perfection and still the best of us are not exempt from mistakes. Experience proves that the man who has made no mistakes has never accomplished anything worth while.

The logical conclusion of these rambling thoughts is that the occurrence of mine explosions can only be hopefully prevented by more effectually striving for improvement in the management of our mines. Never was there greater need of the closer supervision of underground work than at present.

Reviewing the eleven mine disasters in which I have assisted in the work of rescue and recovery of the mines, I fail to find anything that is particularly mysterious regarding these calamities. In every instance, investigation has shown that some one, through ignorance or willful disregard of the requirements of safety, failed in the performance of his part in making the mine safe and the disaster followed as the result.

More than ever, I am impressed with the thought that our greatest need to prevent waste and destruction is supervision of the highest order. Let me say that an organization of this kind does not come about naturally; it is not self-creative, but must be developed gradually, by close and thoughtful study of all the conditions surrounding the work in and about the mine.

Little Regard for Possible Accident

There are many mines that are being operated with little thought of what tomorrow may bring forth. Any suggestion of disaster never enters the mind of the management. If approached on the subject, mine officials console themselves with the thought that they have been operating a long time, on the same scale as that which marks their present undertaking, and have been able to get by without serious accident. Such is their excuse for setting up no new standards, or putting in practice new rules and regulations in place of those at present in force.

Yes, they are aware that a neighboring mine blew up only a short time ago, but say, "We were not surprised for they were surely careless in their methods of operating." As a matter of fact, however, both operations are of the same class and reason suggests that it is only a matter of time when this self-satisfied operator will have a similar experience.

Allow me, here, to refer to another condition that prevails in many mines, but is seldom given much thought. Any one familiar with the inside workings and happenings, in coal mines today, knows that there are many near catastrophes, owing to a blownout shot here, a local explosion of gas there, or a runaway trip in another place. In all of these, it often so happens that conditions are not quite right to make a disaster. We all know, however, that it is good luck and not good management that is keeping many of us from entering the great beyond.

Again, many men working in the mines have a desire to gamble. They take chances and do things that may end in their destruction, simply because it is a little easier or will save a few moments of time. This statement does not apply alone to the ordinary workman, but includes mine officials responsible for the safety of the men in their charge. Nor is it hard to find an instance of this attitude on the part of mining men.

For example, it is well known that substantial concrete or masonry stoppings are absolutely necessary on main flats or entries, in order to insure a properly ventilated mine. In the end, the cost of such stoppings

is doubtless less than the usual makeshift, board stoppings that are so ineffectual in conducting the air forward to the working faces where it is needed. Notwithstanding, however, we find many poorly ventilated mines owing to such worthless stoppings.

Discipline Makes a Safe Mine

By way of illustration, allow me to cite an instance of an operation that was planned to make a safe mine from the first shovelful of dirt thrown out, and has been since and is now operated on the same safe practices. The management have always recognized that safe practices are profitable in every way. From the start, the planning of the mine was carefully executed and adhered to rigidly.

As so often happens, a change of foremen at that time did not mean a change in the plans. All stoppings were built of brick and when the last crosscut holed through, the one behind was closed at once. The foreman or assistant foreman who could not attend to matters of this kind was promptly given a job that better suited his ability.

Gas was reported on the record book and the foreman who countersigned the report made a special report to the management. Standing gas was nowhere allowed and things went bad with the assistant foreman when a fireboss would report "gas," in the same place twice in succession. The district mine inspector who visited this mine was the real thing—the kind worthy of the name of inspector. Several times I had the pleasure of going over the mine with him, and I fail to recall his ever missing a single working place.

In his inspection of pillars and falls, he always gave special attention to their condition. It was a sad day for the fireboss whose dates were not found at the top of all falls where they were required and showing that the places had been examined that day. Old workings were fenced off and signs posted as a warning to persons to keep out. Every detail of the state law was strictly enforced and no thought was ever given to slight any requirement of the law.

Some managers, I am aware, will argue that miners will not submit to any such rigid discipline. In the mine to which I have referred, however, it was found that the workmen accomplished more with less effort and were better satisfied under the strict discipline that prevailed. I want to say that if all mines could be handled and planned like this one, accidents would be few and disasters far between.

Pikeville, Ky. George Edwards.

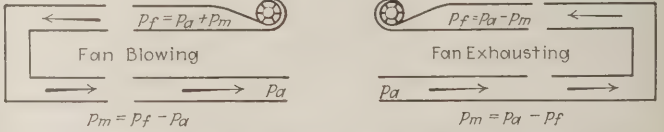
Inquiries Of General Interest

Position of Water Gage When Taking Mine Readings

What Water Gage Reading Represents—Estimating Power on Air from Ventilating Pressure—Power on Air Determines Efficiency of Ventilation

IF IT is not asking too much we would appreciate seeing in *Coal Age* an explanation regarding the correct position of the water gage, as used in mining practice. My desire is to know where it should be placed, in order to give the best results and what the reading of the gage represents. Should the reading be taken in the fan drift, as some claim, or can it be taken at the mouth of the mine? This question is of much interest to us at the present time. Mine Manager.

Carlinville, Ill.



In replying to this question, the first point to make clear is the purpose of taking readings with the water gage and know what such reading represents. As has often been explained in these columns, a water-gage reading indicates the difference of pressure acting on the water in the two arms of the gage. In every circulation of air, there are always two pressures acting, the greater serving to produce and the lesser one to resist the movement of the air. The difference between these two pressures, as indicated by the water-gage reading, is the pressure producing the circulation.

Observe that when the fan is blowing air into the mine the greater pressure is that within the fan drift. This pressure is created by the action of the fan, but caused and measured by the resistance of the shafts and airways. The lesser pressure is that of the atmosphere at the discharge opening. The difference between these two pressures, or the pressure due to the fan less the atmospheric pressure, is the pressure producing the circulation against the resistance of the mine and the shafts. The reading of the water gage represents the unit of ventilating pressure, or the pressure in pounds per square foot, since each inch of water column corresponds to a pressure of 5.2 lb. per sq.ft.

Multiplying the gage reading, in inches, by 5.2 and that result again by the sectional area of the airway or fan drift, as the case may be, gives the total pressure producing the circulation. This total pressure is equal to the mine resistance and includes the shaft resistances if the reading is taken in the fan drift.

If, however, the reading is taken between the main intake and return airways, on the shaft bottom, the result represents the mine resistance only and does not include the shaft resistances, since the gage reading in that case is the difference between the intake and return pressures.

A water-gage reading taken at any point, in the mine, between an intake and return airway, represents

COMPARISON OF BLOWING AND EXHAUST METHODS

only the resistance of the airways inby from the point where the reading is taken. Thus, a reading taken at the mouth of a split or section of the mine represents only the resistance of that split or section.

On the other hand, it should be clear from the foregoing that when the fan is exhausting air from the mine, the greater pressure is that of the atmosphere acting at the intake opening of the mine or the downcast shaft, while the lesser pressure is that due to the action of the fan, decreased by the mine resistance or, in other words, the depression created by the fan

in the fan drift. In this case also, the difference of the two pressures, or the atmospheric pressure less the depression produced by the fan is the pressure producing the circulation, as indicated by the water-gage reading.

In mining practice, the purpose of taking the reading of the water gage is to ascertain the actual power on the air, which makes known the degree of efficiency of the ventilating fan, the efficiency being the ratio of the power on the air to the power applied to fan shaft. When the power applied is taken from the engine card, the result includes the combined efficiencies of the fan and engine. In order to eliminate the power absorbed in driving the engine, so as to obtain the efficiency of the fan alone, it is necessary to determine the brake horsepower of the engine and make allowance for it. The power on the air is found by multiplying the unit of ventilating pressure, which is 5.2 times the water-gage reading in inches, by the quantity of air in circulation (cu.ft. per min.), the result being the foot-pounds per minute, or the power on the air.

The accompanying diagram will assist in making clear the fact that, whether the fan is blowing or exhausting, the mine pressure including that of the shafts is always the difference between the terminal pressures, or the pressures due to the fan and the atmosphere, respectively. Also, when the fan is blowing air into the mine the greater pressure is that due to the fan; while exhausting air from the mine the greater pressure is that of the atmosphere.

Examination Questions Answered

Hoisting Engineers' Examination, Springfield, Ill., Mar. 19, 1923

(Selected Questions)

QUESTION—*What are the laws in reference to persons seeking certificates as hoisting engineers?*

ANSWER—The Illinois Mining Law (Sec. 2g) requires the applicant for a certificate of competency as hoisting engineer, to be a citizen of the United States, at least 21 years of age and to have had at least two years' experience as fireman or engineer of a hoisting plant. He must be of good repute and temperate habits and pass an examination regarding his experience in the handling of hoisting machinery and his practical and theoretical knowledge of the construction, cleaning and care of steam boilers; care and adjustment of hoisting engines; management of pumps, ropes and winding apparatus; besides proving his knowledge of the laws of Illinois relating to signals and the hoisting and lowering of men in mines.

The requirements of a permit to operate a second-motion engine, at mines employing more than ten men, are similar to the foregoing, but require only one year's experience. The application must be signed by three persons willing to testify to the good reputation and personal habits, knowledge and experience of the applicant. The permit applies only to the mine named in the certificate.

An applicant for a certificate of competency as electrical hoisting engineer must produce evidence similar to that required of a steam hoisting engineer, with the exception that the experience and knowledge of the applicant relates to the construction, care and adjustment of electrical hoisting engines, pumps, ropes and winding apparatus.

QUESTION—*What are the duties of the hoisting engineer?*

ANSWER—A hoisting engineer should be on hand a sufficient time before taking charge of his engine to enable him to examine carefully its condition and ascertain the need of oiling and adjusting any accessible parts and giving the same the needed attention. After assuming charge of his engine, the engineer must not leave his post until relieved by another engineer or other competent person. It is a hoisting engineer's duty to know and understand the system of signals in use at the mine and to answer promptly every signal given, never moving the cage except in response to a clearly understood signal. He must use every precaution to avoid accident, in the hoisting of men, taking care not to exceed the speed limit for such hoisting. An engineer must not rely on the accurate working of indicators to determine the position of the cage in the shaft or when hoisting a trip on a slope. He must watch the ropes, which should be so marked as to avoid the danger of overwinding when proper precaution is observed. An engineer must not converse with persons while he has charge of the engine, nor allow persons to loiter in the engine room to detract his attention from the safe operation of the engine.

QUESTION—*A pair of hoisting engines has cylinders 30 in. in diameter and a 60-in. stroke. If the steam pressure is 90 lb. per sq.in., how many revolutions per minute must these engines be making when generating 11,000 hp. per hour?*

ANSWER—It is wrong to speak of "horsepower per hour," estimating the power developed by an engine or pair of engines. The power developed is expressed in foot-pounds per minute, or foot-pounds per hour, but is continuous at that rate while the engine is in operation. In this case, the sectional area of a 30-in. cylinder is $0.7854 \times 30^2 = 706.86$ sq.in. Assuming a mean effective pressure of 90 lb. per sq.in., the power developed in a single cylinder, during one stroke of the engine (60 in. or 5 ft.) is $90 \times 706.86 \times 5 = 318{,}087$ lb. A pair of engines generating 11,000 hp. must develop in a single cylinder $(11{,}000 \times 33{,}000) \div 2 = 181{,}500{,}000$ ft.-lb. per min. Therefore, each cylinder of this engine must make $181{,}500{,}000 \div 318{,}087 = 570 +$ strokes per minute; or $570 \div 2 = 285$ r.p.m., assuming the given pressure is the mean effective pressure in the cylinder.

QUESTION—*Find the horsepower of an engine having two cylinders, 30 in. in diameter and a 5-ft. stroke, when making sixty strokes per minute, with an average steam cylinder pressure of 30 lb. per sq.in., and an average back pressure of 4 lb. per sq.in.*

ANSWER—In this case, the net mean effective or average cylinder pressure driving the engine is $30 - 4 = 26$ lb. per sq.in. The total force acting on the piston in a single cylinder is then $26(0.7854 \times 30^2) = 18{,}378.36$ lb. The engine making sixty strokes per minute, the piston speed is $5 \times 60 = 300$ ft. per min. At this speed, the power developed in the two cylinders is $2(18{,}378.36 \times 300) \div 33{,}000 = 83.538$ hp.

National Coal Association Plans Aggressive Program In Labor and Public Relations

Resolves in Convention to Follow Officers in Active Policy to Be Mapped Out by Committee—Salaried Head to Be Employed Soon—J. C. Brydon Chosen President

Unity and backbone are the two qualities for which the National Coal Association is now striving. At its sixth annual convention within earshot of the surf at Atlantic City, June 19-22, it made a strong effort to begin another year with a forceful policy to be carried out in a determined way under the direction of an unflinching new president John C. Brydon. Almost everything on the program sounded a warning against a continuance of the selfishness and backbiting between mining fields that has almost always marked operators' affairs. Speaker after speaker did this but to marshal the 400 men present into a solid phalanx ready to back President Brydon in a broad and active policy of relations with labor and the public.

The convention heard the stalwart declarations of both Alfred M. Ogle, retiring president, and Mr. Brydon that the association should hesitate no longer but should take an active hand in dealing with labor. It then elected Mr. Brydon and authorized him to appoint a policy committee of the directors to aid in carrying out whatever program shall become necessary. But many a member, voting with apparent firmness for more definite activities by his officers, went out of the convention wondering just exactly what those definite activities are to be. Mr. Brydon said he will select the policy committee within two weeks.

The convention authorized the directors to employ a full-time salaried president at the urgent suggestion of President Brydon, who, however, is expected to remain at the helm at least until the United States Coal Commission goes out of existence, Sept. 22. Mr. Brydon has had direct contact with the commission for months as chairman of the Bituminous Operators' Special Committee. No names of men fit to succeed Mr. Brydon were suggested but it is generally hoped that an untrammelled individual of highest standing and of deep influence can be found.

The nearest thing to a dispute on the convention floor occurred while a resolution was being adopted favoring the reporting of miners' earnings for 1920 to the Special Committee. Of course, there was opposition by men who pointed out the tremendous expense of furnishing that same data for 1921, but the resolution passed. The report of the Special Committee to the association was considered one of the most essential things on the convention program. A number of operators outside the association but who have contributed to the support of the committee's extensive and expensive work—notably a delegation from Illinois—were present but took no active part in convention events. The Illinois men heard the report, were informed as to the prospective activity of the association for the coming year and departed to think it over.

The treasurer's report showed the association to be in sound financial condition and with its normal expenses, other than those incurred in connection with the Special Committee's work, reduced. From January to June the grand total expenditures were $305,000 and receipts $376,000. Treasurer S. Pemberton Hutchinson's report showed a bank balance on June 16 of $104,000.

The new officers of the association are: President, John C. Brydon, Somerset, Pa.; Vice-Presidents, Ira Clemens, Pittsburg, Kan.; E. L. Douglass, Cincinnati; Michael Gallagher, Cleveland; Treasurer, S. Pemberton Hutchinson, Philadelphia; Executive Secretary, H. L. Gandy, Rapid City, S. D.

These directors at large were selected: Frank S. Love, of Pittsburgh, Pa.; Michael Gallagher, of Cleveland; J. B. Pauley, of Chicago (as a member from Indiana); S. Pemberton Hutchinson, of Philadelphia; and E. C. Mahan, of Knoxville. The directors at large were selected upon the recommendation of the nominations committee, which included in its membership Ira Clemens, W. M. Henderson, W. J. Sampson, E. L. Douglass, G. H. Caperton, Hugh Shirkie, T. W. Guthrie and S. L. Yerkes.

In his inaugural address Friday morning near the close of the convention Mr. Brydon minced no words. He is noted for not mincing words. After declaring that officers and directors would be expected to devote time and close attention to association affairs during the coming year he said there should be much closer contact between all fields and all groups because the National must be active, and every man in it must be alive to his responsibilities.

His three suggestions for an active program, were adopted on motion of Phil Penna, of Indiana, amended by T. W. Guthrie of the Hillman Coal & Coke Co. at the close of the address.

The first suggestion was that a policy committee be created to map out activities for the association as the need arises, that the publicity campaign be continued, that the association's bureau of coal economics be expanded so as to collect and complete masses of data on many subjects, and that a study be made to develop methods of getting the best out of employees at a fair daily wage.

His second proposal was that a "minute man" organization of operators be maintained all over the country, trained and ready at anytime to meet emergencies such

as the present situation involving relations with the U. S. Coal Commission.

The third main suggestion was that the presidency be made a full-time, salaried job. He thinks the president should be a broad-gage, capable man unhampered in his association work by any connection with divided or competing coal interests.

Mr. Brydon wound up by frankly speaking of evidences of selfishness and distrust among operator groups during the past year and said such feelings must be forgotten. His address, in more detail, appears in another column.

The convention offered an opportunity for much good fellowship, many plunges in the salt and invigorating waves and for some sober thought. At its close Mr. Ogle, the retiring president, remarked that probably the most valuable service it had performed was the awakening of the association to a willingness to face facts.

For the first time in the history of the National, an invocation was offered. The Rev. Dr. Elwood, of the Boardwalk Church, followed his prayer with a sparkling, forceful talk on the value of unity.

Harry L. Gandy, executive secretary, who succeeded J. D. A. Morrow last winter after Mr. Morrow had resigned, read an annual report summarizing much of the association's work, pointing out the need of better contact between the operators of various fields.

Then came Gray Silver, Washington representative of the American Farm Bureau Federation, advocating a panacea for all the transportation ills of the coal industry—a type of affliction which he thinks the most serious the industry has to face.

"Encourage hydro-electric development" said Mr. Silver in striking his keynote. "Use the country's coal to generate electricity. Transport current, not coal, and all the worries of car service and motive power and railroad congestion will end." Eight million farm homes are awaiting the time when cheap electricity will be available to them. The market for light and power is almost unlimited. The demand for coal to generate that current will be steady and tremendous. Your mines could produce more coal and sell it at a lower price. Your excess labor would have employment. Strikes would be fewer. There would be less chance for a continuance of misunderstanding between coal men and the public because you would be recognized as the men who help to reduce drudgery and increase happiness in homes."

Mr. Silver solemnly warned the coal men that the great and powerful farmer in this country has many troubles of his own and the coal men should take care not to add any more, lest the farmer be one of those to rise and force a remedy for the ills of the coal industry. He reminded them that the American government is a government of checks and that it is sure that if an evil that harasses the people is not corrected by those directly concerned, then the people will set up machinery to correct it themselves by government regulation.

"And it is only a step from regulation to nationalization," said he. Mr. Silver strongly urged mutual helpfulness between the coal industry and the farmers, who form, he said, the biggest single group of coal consumers.

What the Convention Did

(1) Elected J. C. Brydon, of Somerset, Pa., president.

(2) Created policy committee to lay out active program along any line that seems worth following. President Brydon to appoint members of this committee soon.

(3) Authorized officials to set up "minute-man" organization of operators all over the country to be ready for such emergencies as the one raised by U. S. Coal Commission.

(4) Authorized directors to employ full-time president on salary. Mr. Brydon to withdraw in his favor when he is chosen, possibly after U. S. Coal Commission dissolves.

(5) Heard bituminous operators' special committee's report.

(6) Resolved that earnings questionnaire for 1920 will be filled out similar to that for 1921, already supplied to Coal Commission.

(7) Heard much exhortation to unify and forget selfishness and mutual distrust.

(8) Plunged daily into Atlantic Ocean.

The National has learned some things about the art of publicity during the year, C. E. Bockus, chairman of the publicity committee, said in his report. It has learned that in order to get the attention of the people sensational things must be said. And so sensational things are being said through a publicity organization, with the result that information of many types about coal, all aimed to give the public a better understanding of the industry, is getting newspaper and magazine space never before available for the defense of coal. These sensationalisms are not untruths. They are merely facts dressed up in a style which "goes."

Mr. Bockus reported a vast distribution of material to high schools, colleges and centers of public opinion, aimed to combat the movement toward nationalization and government control. He reported that the association's weekly paper, *Coal Review*, is now practically on an earning basis.

The railroad relation committee got the convention to adopt its report opposing the Warfied car-pooling plan which provides for the pooling of railroad cars under Congressional authority. The report was read by C. H. Jenkins of Fairmont, W. Va., in the absence of E. C. Mahan, who is ill.

Vice-President Ira Clemens, of Pittsburg, Kan., took the chair at this juncture. A letter from Senator A. O. Stanley, of Kentucky, who was sorry he could not attend, was read. A cable message from J. G. Bradley, former president of the association, said: "Regret absence. Good luck."

Retiring President Ogle, in his address ending this official service, took no backward step. Instead of closing his year with a few generalities and pleasant words of thanks and commendation to his officers and the association, he declared once more his program laid down at the convention a year ago at Chicago. He wants the association to adopt

an active policy for labor and public relations, each mining district striving to handle its labor affairs in its own way and each advising and co-operating with every other district. He granted it might not be practicable for the machinery for such activity to be worked out in detail by the convention but the directors should be empowered to do it soon.

If a bureau had been at work in the spring of 1922 with wholehearted support from every operators' quarter, directing a definite program, the outcome of the strike might have been different, he declared. Unity would have saved the day. Since then the coal industry has become a political football because public and labor relations were hardly attempted. However, the brief effort at educating the public made during the strike was successful enough to prove that such work should be carried forward on a big scale.

But lack of contact between operator groups and individuals and the more serious fact that efforts of one group often were discredited by others, were criticised most severely by Mr. Ogle. However, he was not for bewailing spilled milk. He was for profiting by the lessons of the year. He was for the adoption of a method, which he did not describe, for handling the labor, which accounts for 68 per cent of the cost of coal and 98 per cent of coal's trouble. And he was for a concerted, level-best effort by operator's to prevent strikes before some outside force steps in and does some unintelligent thing.

"Protection against such difficulties as those of 1922 is demanded by an irritated public," said he. "How is this to be obtained? That, I believe, is for us to say. An opportunity far beyond anything the industry has ever had before has been put within our hands. The Coal Commission at Washington is today, we are convinced, completely anxious, in fairness and without favor, to help the industry work out its problem. It extends to the industry a helping hand.

"With all possible conviction I want to express the belief that the commission will find as a result of its studies that the surest means of serving the public will call for a minimum of legislation and a maximum of self-determination within the industry. That self-determination must, of course, to be acceptable be exercised with due regard to the interest of all parties concerned, namely the coal-mine owner, the coal-mine manager, the coal-mine worker and the coal consumer."

When Mr. Ogle had finished, the convention rose, en masse, and lustily applauded the retiring president.

The convention was remarkable in that there was no banquet. On Wednesday evening the association replaced that time-honored function with a program of vaudeville and boxing at an athletic club where Atlantic City's prize fighting is held. Both delegates and their ladies listened to the songs and skits and looked on while the meat-faced and "tin" eared athletes did their stuff in four eight-round bouts.

Thursday morning a letter from Dr. Charles W. Eliot, president emeritus of Harvard University and recognized as an authority on industrial economics, was read by Goldthwaite Dorr, of counsel for the Bituminous Operators' Special Committee. Dr. Eliot declared the need is great for order in all coal fields, for public protection against every form of monopoly, whether by labor or capital, for impartial arbitration and for incorporation of labor unions. The letter is printed on another page.

Recognizing Harry N. Taylor, former president of the association in the audience, Mr. Ogle called him to speak. After a few graceful words of appreciation Mr. Taylor declared it is pitiful for an industry to be in such condition that its product is consistently sold below the cost of production, as the product of the coal industry is sold today, according to official reports of the Department of Commerce. In more hearty co-operation, between operators lies the cure, he said.

The report of the Bituminous Operators' Special Committee was then heard. Mr. Brydon, chairman of the committee, read it to a convention of deeply interested delegates. The reading of the report was one of the outstanding events of the convention. Officially it was the report of the government relations committee of the association, but the activities of that large body were principally performed by the smaller Special Committee, which has been supplying the U. S. Coal Commission with the "broad essential facts" of the industry. The Special Committee is made up of Mr. Brydon, its chairman; Michael Gallagher, T. W. Guthrie, George B. Harrington, F. W. Lukins, R. H. Gross and E. L. Douglass.

The report traced events leading up to the Special Committee's creation and the resignations, for various reasons, of Harry N. Taylor, E. C. Mahan and J. G. Bradley. It recited the activities of counsel in developing facts, proving a case of labor monopoly against the United Mine Workers. In briefs on labor violence it was set forth to the Coal Commission that the unlawful acts of the United Mine Workers were directed not against operation but against the public and that they "afforded striking illustration of the un-American policy endorsed by the miners' union—that no member should be allowed to mine coal in the United States under peril of death." Four of these briefs were filed covering cases in Ohio, in the Consolidation Coal Co.'s properties in northeastern Kentucky, in Herrin and on the abuse of the check-off. Similar briefs on events in Indiana, Utah, Alabama, Colorado and West Virginia are to come.

Cost of living and community life studies have been made, the data to be used later. A brief on margins of profit, pointing out that no standardization of costs and profits is possible in such a competitive industry has been filed.

A special study of transportation is now in progress, local operators' associations have been encouraged to file briefs of their own cases. A large amount of both economic and statistical work has been done by staffs aiding counsel. The field work is about finished but many economic studies are now being made on: (1) Comparison of financial results of bituminous coal operation before 1916 and since; (2) effect of strikes on the price of coal; (3) effect of increasing labor costs on coal prices; (4) comparison of pay in coal and other industries; (5) profit sharing in England and English wage-regulating methods; (6) attempts that have been made to base wages on changes in the cost of living; (8) working rules imposed on men by United Mine Workers. A large legal, field, statistical and clerical force is used for all this work.

It is costing operators between $5,000,000 and $10,000,000 to answer the commission's questionnaire forms C-1 and L-1, the report estimates.

After speaking of the various questionnaires it had sent out the government relations committee remarked that lack of cohesion in the industry was a serious obstacle it had to meet. It urged "various interests of the bituminous coal industry to free their minds of suspicion each for the other and to meet each other in a spirit of friendliness, confidence and tolerance."

The committee said it at first refrained from public propaganda but after the miners had violated their promise not to propagandize, the committee was released by the Coal Commission to do likewise. So a department of public information was organized and is serving out coal publicity to all sorts of papers and magazines.

To pay the bills of all this activity an assessment of four mills per ton was levied against association members Oct. 11, 1922, for three months and repeated April 11, 1923. No further assessment is expected during the life of the Coal Commission, which ends Sept. 22, 1923.

Following this report a resolution of sorrow at the death of John J. Tierney was adopted.

Then Colonel Henry L. Stimson, of counsel for the Special Committee, spoke for 20 minutes, forcefully advising unity. He said the experience with the Coal Commission has taught operators the value of a united industry viewpoint and shown the necessity for constructive leadership in the industry. The wide divergence between union and non-union fields observed at first have turned out to be merely differences of detail, he said, advising that all the main differences be now wiped out so that the industry can correct its own ills rather than suffer the correction from without.

Three sorts of labor relations are now operative in the mines, he said. They are unionism, non-unionism and direct dealing of operator with his own men. The latter is not common, but its success, he declared, is marked. However,

no two of them should be abolished in favor of the third. That would mean industrial war. Tolerance of the other fellow's idea of proper relations is essential. Impartial arbitration is the best preventive of industrial warfare. That's the only way the people can learn the facts of a controversy. However, it is vital to operators that they unite, show their strength and stand on their legal rights, else they will have no legal rights.

Colonel Stimson warned that the troubles of the industry won't end Sept. 22, when the U. S. Coal Commission goes out of office, and operators should take a long look ahead.

A little verbal passage at arms accompanied by a faint odor of brimstone followed the appeal of Mr. Dorr, of counsel, that operators fill out from 1920 an earnings questionnaire similar to that filled out for 1921. But the decision was finally in favor of the members filling it out.

Mr. Dorr said the Coal Commission asked for 1921 earnings because that was the most recent full year previous to the strike. But being a year of depression, the figures are not showing the commission a true picture. Earnings per man are going to appear low.

Several men at once pointed out the tremendous trouble and cost of getting out such a report for 1920. Included was Charles F. Richardson, of western Kentucky. But the association leaders were for it. T. W. Guthrie pledged himself to do all in his power to get all the operators in his region of Somerset County, Pennsylvania, to supply the data. Tom W. Lewis argued for the 1920 figures. President-elect Brydon said 1920 data are essential in order that nothing may be left to commission conjecture. It was finally decided to send out a circular letter to get the 1920 information, with the hope that the response would be a lot better than the 30 per cent average response to previous questionnaires of the Special Committee.

JOHN C. BRYDON
Newly Elected President of the National Coal Association

Governor Morgan of West Virginia was invited to speak at the opening of the final day's session. He paid his respects to the many investigators who have misrepresented conditions in his state and hoped the U. S. Coal Commission would do something constructive.

A rising vote of thanks was given W. H. Cunningham and his committee on convention arrangements. The reluctant Walter was dragged into the spotlight by his loving friends, whereupon he delivered himself of the following lengthy oratorical gem: "Mister President, I'm a man of few words and not many of them. I thank you."

"A good speech," commented Ogle from the chair.

Bolshevism appeared as a real and immediate menace to America and to the coal industry during the next 45 minutes of the convention. Colonel Guy D. Goff, former general counsel to the Shipping Board and until recently assistant attorney general, made such an able case against "The Poison in a Democracy" that many a man present got a new vision of what is going on in the one-third of the world now under Red control and of the Red activities to gain the upper hand in this country.

Following Colonel Goff's address, which won an intent hearing and hearty applause, the new board of directors organized, President-elect Brydon made his address and the resolutions of the convention were adopted. Routine resolutions ratified the activities of the retiring officers, and directors, especially Retiring-President Ogle, expressed appreciation of the work done by the Bituminous Operators' Special Committee, did the usual courtesies to those who had to do with the convention, thanked the visiting speakers and changed the by-laws in a few unimportant details, one of which added an extra directorate to be filled when a paid, full-time president shall have been employed.

The final resolution provided that "the board of directors may provide for compensation to the president if the president devotes his full time to that office" and may elect from outside their number, a paid vice-president.

Directors elected by state groups and announced by the committee on nominations were as follows: Maryland, G. Marshall, Gillette; Pennsylvania, John C. Brydon and Edward Soppitt; West Virginia, C. H. Jenkins and C. C. Dickinson; northeastern Kentucky, E. L. Douglass; Missouri, F. W. Lukins; Tennessee and Georgia, L. C. Crewe; Utah and southern Wyoming, Moroni Heiner; Michigan, R. M. Randall; Ohio, S. H. Robbins, Tri-State Coal Stripping Association, W. J. Sampson.

The appointment of the following new members to the Bituminous Operators' Special Committee, which is co-operating with the U. S. Coal Commission in its investigation of the soft-coal industry, was announced on June 25, by Chairman John C. Brydon: A. M. Ogle, of Terre Haute, Ind., retiring president of the National Coal Association, and S. L. Yerkes, vice-president of the Grider Coal Sales Agency, of Birmingham, Ala., and director of the National Coal Association.

"Both Mr. Ogle and Mr. Yerkes have been invaluable in an advisory capacity since the formation of the special committee," Chairman Brydon declared. "I am gratified that circumstances have made it possible for Mr. Ogle and Mr. Yerkes to see their way clear to accept appointment to the two vacancies created some time ago and to become active special committee members. Their acceptance completes the membership of the committee, which is now composed of nine members who represent the bituminous industry well geographically.

"The work of the Special Committee is now approaching its most important period. The field work and the assembling of statistical data from the various fields within the thirty coal-producing states is virtually completed.

"It now remains to compile the facts and data which have been collected and to present them to the Coal Commission, working out from those facts suggestions and policies of how the bituminous industry can best serve the public and insure at all times a steady flow of good quality coal to the consumer at fair prices."

The complete membership of the Special Committee follows: John C. Brydon, chairman, of Somerset, Pa.; R. H. Gross, of Boston; E. L. Douglass, of Cincinnati; Michael Gallagher, of Cleveland; Tracy W. Guthrie, of Pittsburgh; George B. Harrington, of Chicago; F. W. Lukins, of Kansas City; A. M. Ogle, of Terre Haute; S. L. Yerkes, of Birmingham.

President Brydon Makes Three Proposals in Speech Of Acceptance to National Coal Association

The speech of acceptance of John C. Brydon after his election as president of the National Coal Association at the Atlantic City convention June 22, in which he proposed a policy committee to lay out an active program for the association, that a "minute-man" organization of operators be built up and that the association presiding be made a full-time salaried job, follows:

"For some months I have been serving you in the capacity of chairman of the Bituminous Operators' Special Committee. You have now elected me to the highest office within your power. In accepting that office I do so with profound appreciation of the confidence which you, by your votes, have expressed and also, I must add, with a very deep and definite realization of the responsibilities which you have placed upon me.

"The National Coal Association, created in order to unite the coal industry into a harmonious whole for helping our country win the war, is like our country in its form of organization. It is a federated body composed of distinct and separate members, each with its own local organization for dealing, in its own way, with its own local problems; but all joined together in the work of advancing the good of the entire industry.

"The history of the year just closed makes it clearly evident that our association must deal with national problems, and so, in certain broad and fundamental matters, must act for the great body of its members. No single group should, nor can, direct its policy. This policy must be national in its scope. Individual ideas regarding fundamental matters, when opposed to a majority idea in the interest of the general good, should be submerged. In matters which affect the industry as a whole, the minority should willingly subject themselves to the settled experience and convictions of the majority.

"In attempting to act for this majority, however, it is often difficult to determine what this majority's attitude is on a given question in time to take the right step at the most effective moment. The causes of this are two in number: (1) An insufficient acquaintance on the part of the national officers with the general thought of the industry, due, often, to their inability to enjoy proper frequent personal contact with the component parts of the organization; and (2) The general apathy and indifference of the various component and more or less scattered units, as to the problems of their neighbors and associates in the industry. Sometimes these local groups appear to take only a passing interest even in their own affairs.

Acceptance of Office Carries Responsibilities

"To accept an office in the national body, is to accept very genuine responsibilities. It demands from an official his most careful thought and consideration. This applies not only to the national president, vice-presidents, secretary and others in the national headquarters; it applies equally to every single director on the National Coal Association's board. Too often the duties of your directors are held lightly; too often your directors are absent from meetings. This should not and must not longer be allowed to continue.

"It is not only incumbent upon the directors to consider their responsibilities to their constituents; it is equally incumbent upon the membership of this association to see that they do. Furthermore, when the directors give their best it is up to the entire membership to assist them with its fullest co-operation. Unless we can have a board of directors who will at all times have the responsibilities of their office uppermost in their minds in the service of a body of members which is informed, alert and sympathetic, we cannot act properly on any matter of interest to the Association.

"Secretaries of local associations are oftentimes the only ones who have the time or opportunity to give their undivided thought and attention to the general conditions and needs of their districts. They are often the only contact point between one district and another. With these local secretaries the National officers should at all times aim to keep in close personal contact. In every possible way they should be helped to build up solid, substantial, successful organizations. Their interest should be ours; ours should be theirs. Hurt to one of us is harm to all.

"In order to promote this purpose more actively, it is proposed that frequent contacts be made not only with the secretaries but with the operators in the various districts by means of visits by the National officers to the local associations and by conferences of local secretaries and officials. In addition to such contacts in the field, the headquarters at Washington must at all times be kept available for the benefit and help of the local operators and secretaries. For that purpose there soon will be provided rooms in the National offices which will be considered the headquarters of any operators or secretaries who may be visiting the national capital. In these rooms will be found every possible facility for their work while in Washington. But, gentlemen, I submit that after this past year's experience, we ought to plan for still other ways to help each other and our industry.

Policy of "Encouragement" Lacking

"The third clause of the National Coal Association's certificate of incorporation says that the object of the organization is to 'the encouragement and fostering of the general welfare of the bituminous coal-mining industry of the United States.' But up to the present time the National Coal Association has had no positive, well-defined policy for carrying out this object. In spite of that, as we have seen, our organization has been officially recognized by government officials as the legitimate—and practically the sole—representative and spokesman for the entire bituminous-coal industry. The responsibility which this recognition represents came to us as the result of a great emergency in which both the country and the industry found themselves.

"Gentlemen, I submit to you that the meaning of all this is plain and unmistakable. It means that we must no longer allow our association to be the mere creature of such emergencies as may chance to come upon us. We must organize in advance of their arrival; we must try to *keep them from arriving!* It is no longer for us to choose whether we will speak authoritatively for our industry or not. Fate has made that decision for us. Fate, you might say, has forced us to comply without articles of incorporation! It has made us get under the responsibility which we then saw only dimly, but which we now see plainly.

"All this means that the time has now come when, as an "association for the encouragement and fostering of the general welfare of the bituminous coal-mining industry in the United States," we must outline a more definite, more positive, more aggressive policy of organization and action. I therefore recommend that there be added to the standing committees of the association a 'policy committee,' which shall proceed to consider and formulate the steps which should be taken. In the past the tendency of the coal operators has been to sit back and admire themselves for their probity and honesty of purpose, failing meanwhile to tell the public either what they were doing or why they were doing it.

"All of us now recognize the gratifying results recently obtained by the Bituminous Operators' Special Committee through their bureau of public information in the correction of such an unorganized and unsatisfactory situation. The public has long been misled, but it is now beginning to learn the truth. I submit that what this committee has started, the association, with the approval of its 'policy committee,' should perpetuate in the interest of our industry. We must stand ready and willing at all times to keep the public informed of the true situation in the field of bituminous coal.

We must organize to put ourselves regularly and continuously into closer contact with the public's interest and the public's mind. If we do this and if the 'policy committee' and the directors keep us doing new and worthwhile things for the improvement of our industry, every editor in the country will be glad to publish the facts. That is all we ask.

"Our bureau of coal economics has for some time been obtaining statistical information on certain subjects of decided value to the industry. The Bituminous Operators' Special Committee has learned in the course of its relations with the commission and the public that this statistical material has not covered enough of the facts to meet the needs which we now see are certain to arise. I believe that this bureau should become part of a larger department which would aim to have at all times on hand or easily available the full information, statistical or otherwise, relating to any specific matter likely to be of use either to our members or to the public's better understanding of the aim and the activities of those members.

"Such a department or bureau would help us all to do our work better. It would provide a central meeting point for discussing and exchanging experience and information concerning the biggest problems or the best practices throughout the length and breadth of the soft-coal fields of America. How can an operator get the best out of his mine, the best out of his machinery, the best out of his materials? For all such information our organization should, in ways to be recommended to the executive committee by the policy committee, make itself the clearing house—the point of central collection, digestion and dissemination. In my opinion also we should not fail to include in such information the study of the greatest problem of all—how to get the best out of our men, how to secure the utmost of an efficient, willing day's work in return for a proper day's wages. Recent experience has shown that the association may, with propriety—and, in fact, for the holding of the confidence of the public, *must*—arrange to give this matter of securing the best from our workers the thought and attention which represents the attitude of the industry as a whole.

"Only in these ways can we make sure that the association is properly fulfilling its obligations to the operators and the entire personnel of the industry and to the public. In connection with the last named I wish to make a proposal in line with the further extension of the kind of service which we have been able to perform for the government since our organization in 1917.

"It was my misfortune—or good fortune, as the case may be—to be a part of the U. S. Fuel Administration throughout all of its life and so to have a chance to observe its activities. It will be recalled by all of you that at first the practice was to exclude from this work all those who had at that time any connection whatever with the industry which they were asked to help direct. The disastrous results of this practice are inevitable; in this particular instance no semblance of order was brought about until the U. S. Fuel Administrator called to his aid the practical coal men of the country.

"Now, in view of this distressing experience, I wish to propose that this national body, here assembled, take occasion at this time to offer to the government the expert knowledge of its membership in the production and the distribution of soft coal. The acceptance of this offer would mean that, in co-operation with the proper governmental and transportation officials, we would work out in advance a nationwide plan which, in the event of any national emergency, would instantly place at the disposal of the government the nation's entire resources of soft coal, ready for efficient distribution and use.

"This plan of coal mobilization could be so comprehensive that it would apply not only to the central organization at government headquarters but even to the remotest coal-producing district in the whole United States. Its details should so definitely specify the personnel that the moment an emergency arose, every man would proceed instantly to his prearranged post, and at once begin to function for the protection of the nation's life.

"One more proposal and I am done. My experience as chairman of your Special Committee has taught me another basic fundamental truth which I want to lay before you for your most serious consideration. It is this. I believe that no man can serve this huge, vital and widely scattered industry in the capacity of its chief executive unless he is free to give it his entire attention—unless, he is a full-time man. There are many reasons for this. I will mention only one.

"Now that our association has come to represent the soft-coal industry throughout the nation, its chief executive cannot fulfill his obligations unless he thinks of the industry in terms of the whole industry, without prejudice for or against any group and regardless of his own individual interests. With our organization playing such a part in the life of the country it is manifestly unfair, either to the association or its chief, to place any man in this position of divided and competing interest.

"I recommend, therefore, to your most earnest thought and action a full-time man to be the executive head of this organization. I say to you further and in all sincerity and earnestness that in my opinion this selection should not be delayed. I shall willingly and gladly pass over to him all those responsibilities which you have thought proper to put upon me the moment such a man is found. I recommend that this convention here and now proceed to set in motion the machinery which will enable the directors to take the step I believe is proper and for the best interests of the association and the industry.

"In this as in all things, there must be confidence expressed by each of you for the other, and there must be a ready response of each for the good of all. Selfishness and distrust must be forgotten. Confidence and willingness to serve must take their place. Without this we cannot be of use to each other inside the industry, nor to our fellow citizens outside. With this we can hope to face the year ahead of us in full belief and confidence that our industry and our organization will meet and make the most of such great possibilities of nationwide service and nationwide recognition as we have never hitherto been bold enough to dream of."

Dr. Eliot Says Miners Union Should Incorporate If Peace Is to Be Had

Incorporation of unions, arbitration as a means of teaching coal facts to the public and the abolition of every form of monopoly either by labor or capital were advanced as necessary to peace in the coal industry by Dr. Charles W. Eliot, president emeritus of Harvard, in a letter written to the National Coal Association in convention June 19-22 in Atlantic City, N. J. Said he in his message:

"That part of the American people which thinks about the existing industrial warfare from the consumers' point of view and with a forward look to the general welfare is hoping that the U. S. Coal Commission will see its way to make recommendations on the following subjects:

"(1) The keeping of order in all the coal fields of the country, unionized, non-unionized, and those managed by direct negotiation between the employer and his employees, to the end that the country's supply of coal may be fully maintained, while indispensable improvements in industrial relations in the coal industry are being devised and brought into use.

"(2) The protection of the public against every form of monopoly in the coal industry, whether attempted by labor or by capital. The American people have already shown by their votes, their voluntary actions in emergencies, and through the press, that hereafter they will not have the supply of coal to the factories, households, and carriers of the country abridged, much less stopped, by any monopolistic control whatever. The reaction of the public all over the country to the police strike in Boston was instructive on this matter.

"(3) The high value toward the prevention and settlement of industrial disputes of face to face discussion between the parties before an impartial arbitrator whose decision is effectively published. It is not essential that the arbitrator should have power to enforce his decision on the disputants. It is enough that public opinion is informed through him about the nature of the dispute and the motives of the disputants. A striking illustration of the value of such published discussions occurred last year in Canada,

which has now enjoyed for many years its excellent Industrial Disputes Investigation Act. In that year not a single working hour was lost through industrial disputes of any of the railways or in any of the railway shops of the Dominion. In the same period strikes among railroad employees caused heavy loses to railroad labor and capital in the United States, caused many distresses and much loss of valuable time to the American public at large.

"(4) The incorporation of all unions which relate to the coal industry and the industries that distribute coal. In the public interest it is inexpedient that these secret societies, which collect large sums of money from their members, and use all their resources to support strikes however violent, should continue to be exempt from the usual legal processes to prevent violations of contract and enforce payment of damages. The steady resistance of all unions to incorporation should have revealed to the American public long ago the illegitimacy and dangers in a republic of their policies and aims. They possess great power, but claim exemption from responsibility for the use of that power.

"(5) The creation of industrial commissions for numerous districts or localities within which peculiar but recognizable local conditions exist, commissions with powers of public investigation and recommendation in industrial disputes. The idea of uniformity in wages, hours, conditions of work and mode of life among workmen in city and country, in cold climates and hot, in lowlands and highlands, in industries that must be continuous and in those that need not be, and in highly seasonable employments and those that are not, may fairly be said to be completely unreasonable. In practice it has proved to be pernicious. Hence the need of local or regional industrial commissions.

"(6) The inculcation among the classes or groups that carry on the industrial war of the doctrine that within the past 150 years science, art, popular education and politics have achieved so much progress as to make now possible the substitution of conference, discussion, conciliation and arbitration as means of securing human rights, for the former inevitable method as destroying property and killing or wounding adversaries.

"(7) The development of the partnership relation between the employer and his employees, as distinguished from the landlord and tenant or the master and servant relation. This partnership idea does not exclude from a mill, shop or factory methods which imply subordination, discipline, punctuality and systematic co-ordination. Far from it; but the discipline and co-ordination must be co-operative. It does exclude the sharing of losses as well as gains by all the industrial partners, because the 'hands' in most industries are not in position to meet losses of capital in the business from which they earn their livelihood. If thrifty, they are acquiring capital, but as yet have acquired but little.

"(8) The abandonment by all concerned of the policy of reducing individual, group or a community productivity as a means of promoting individual, group or community welfare and national prosperity. The success of democratic institutions depends, in the long run, on *every* citizen's doing *his* best for the common welfare. Slackers and malingerers belong in a society based on slavery, not in a society of freemen. The progress of democracy depends on the successful development in all sorts and conditions of men of personal initiative, interest in the work that yields the livelihood, joy in work loved and ambition to excel in it. Every successful industry is characterized by increased production, not by diminished. Every effective and happy human being yields a similar result."

Southwest Operators Recite Difficulties of Producing Coal in That Field

The Southwest Interstate Coal Operators' Association, representing the soft-coal industry in Missouri, Kansas, Arkansas and part of Oklahoma, reported to the U. S. Coal Commission on June 2, 1923, that oil is driving the production of their mines out of the market and the coal industry in this section is facing ruin. The mine workers are accused of interfering with operations, restricting output and otherwise making it impossible for the operators to compete with oil and with coal from other fields.

The report sets forth that "the policy and practices of the United Mine Workers of America have become insuperable obstacles to the efficient and regular production of coal in the Southwest. This policy has involved wholesale violations of contract, interference with the legitimate functions of management, maintenance of an exorbitantly high wage scale, resistance to the introduction of labor-saving machinery and safety devices, and the use of intimidation and violence to prevent any operator or worker from mining coal except under the domination of this labor monopoly."

The right to hire or discharge men, vested in the management, according to a contract with the union, has been consistently violated, according to the statement, which says:

"The utter inability of the operator, on account of interference by the United Mines Workers of America to exercise free and untrammeled management from the viewpoint of economy, good judgment, or scientific mining, has increased the cost of production at least 25 per cent in this territory."

The operators' report gave the following as some of the examples of this interference:

Refusal to allow miners to work at more than one job during an eight-hour day, thus requiring the employment of additional men to do work that could be done by one.

Dictation by union committees, which prevents miners obeying instructions of the mine foreman.

Passage of resolutions and arrogant rules by local unions, interfering with the right of management and the right to hire and discharge.

Strikes over petty disputes, which should have been settled by arbitration under the agreement, causing the shutdown of mines, and constant strikes over questions of time and pay which were provided for in the agreement.

Particular stress is laid by the operators on the hostility of the mine workers to the introduction of undercutting machines. The report further states that the rank and file of the United Mines Workers in the Southwest recognized the conditions facing the operators and are willing to give proper consideration to a readjustment in wage scales to meet these economic conditions "but are prohibited from doing so by the system of making and enforcing a national basic wage scale such as was negotiated in the last conference in New York by two and one-half states, under the name of a tri-state conference, representing a trifling per cent of the tonnage for the entire industry of the United States, and a tonnage which is not affected by oil and gas competition to any appreciable extent."

J. C. Brydon 33 Years in Coal Industry

John C. Brydon, newly elected president of the National Coal Association, was born in Bloomington, Garrett County, Md., in 1871, and began his business career in 1890, when he became mining engineer for the Davis Coal & Coke Co., one of the Davis and Elkins interests in West Virginia. He went up through the ranks to the position of general manager, which position he resigned in 1902. In that year he became general manager of the Somerset Coal Co., at Somerset, Pa., which was one of the first moves of the C. W. Watson interests into Pennsylvania representing a combination of a large number of individual operations in Somerset County, and which later became a part of the Consolidation Coal Co. Later he also took charge of the Maryland Division of what is now the Consolidation Coal Co. In 1906 he resigned to become president of the West Kentucky Coal Co., one of the subsidiaries of the North American Company, with headquarters in New York.

Resigning all salary connections with those interests, he went into business for himself in Somerset County, and organized the Quemahoning Creek Coal Co. and the Listie Coal Co. He is president of both of those companies, which operate four mines in two counties. He also is president of the Maryland Big Vein Coal Co., which he organized more recently. He is a stockholder in several West Virginia companies.

Letter by Wadleigh and Address by Parker Feature Coal Retailers' Convention at Scranton

Coal dealers from all over the country comprising the membership of the National Retail Coal Merchants' Association, gathered at Scranton on Monday, June 25, for a three-day session in their sixth annual convention. Association business and reports of committees occupied the morning sessions on Monday and Tuesday while Wednesday was devoted to a trip to the mines.

F. R. Wadleigh, Federal Fuel Distributor, who had been invited to speak before the convention, was unable to attend but wrote the following letter to Roderick Stevens, chairman of the Board, in which he explained to the retail coal dealers his purpose in making a study of community coal storage. The work was undertaken at the request of the Secretary of Commerce, Mr. Wadleigh says, "for the purpose of obtaining all facts and possibilities pertaining to the subject in general and to certain selected communities in particular.

"As there seems to have been considerable misunderstanding of the purpose in making this study, I desire to emphasize what I have previously endeavored to make clear by correspondence and conversation; namely, that the proposed study does not necessarily involve governmental ownership or operation, but is solely an effort to obtain all information bearing on the subject, together with its possibilities, so that we may know definitely whether it is worth developing, for the public benefit.

"In order to have the advice and co-operation of some of the leaders of the coal industry, I appointed an Advisory Committee of coal operators. The committee has had no meetings, the matter having been handled entirely by correspondence, as it was desired to take up, as little as possible, the time of the individual members.

"To make the necessary field investigations, I secured the services of E. A. Blake, until recently general superintendent, Eastern Division of the Norfolk & Western Ry. Co., Roanoke, Va., and of Geo. S. Pope, engineer in charge of the Government Fuel Yards, Washington, D. C. Mr. Blake is a railroad man of wide experience on coal-carrying railways and is thoroughly familiar with all problems of rail transportation of coal. Mr. Pope, in addition to being an engineer by training and experience, especially familiar with coal, has been in charge of the Government Fuel Yards at Washington since they were first put in operation.

"The places selected for a study of community coal storage were Chicago, Ill.; Detroit, Mich.; Buffalo, N. Y.; Minneapolis and St. Paul, Minn.; Worcester and Lowell, Mass.; Indianapolis, Ind., and Cleveland, Ohio.

"All of these cities were visited by Messrs. Pope and Blake and conditions at each carefully studied, with the assistance of local authorities, commercial and engineering bodies and the leading coal merchants. The field studies have now been completed and Messrs. Pope and Blake are preparing their final report, which will be sent to the advisory committee for their views and recommendations, after which the report will be placed at the disposal of the U. S. Coal Commission for use as a portion of their final report.

Discussing publicity and advertising for the coal industry, Mr. Wadleigh pointed out the prominence given to the coal question by the evidence of the past spring and winter, which, he said, "have advertised the industry to a much greater extent than had ever occurred before and have brought its problems actively before Congress and the public, no doubt to the ultimate good of the country and of the industry. One definite need of the industry in the past and today is a comprehensive scheme of co-operative publicity along lines that will increase the economical use of coal generally.

E. W. Parker, director of the Anthracite Bureau of Information, speaking on "Mining and Preparation of Anthracite" the second day of the convention, told the delegates that estimates of the life of the anthracite region at the present rate of production vary from 60 to 100 years.

"Two things are certain," he said. "One is that the peak of production has been reached, while the population of the anthracite-consuming territory is continuing to increase, which does not tend to lessen the demand. The other is that not many more years—a few decades at most—will elapse before the inevitable period of decline must begin. We are already face to face with the proposition that anthracite is becoming from year to year more and more a luxury fuel.

"There has never been a time in the history of the region," he added, "when more care and expense have been exercised in the preparation of anthracite than at the present time. I am speaking now of the responsible anthracite operators, not of the pirates who have seized upon the necessities of the public during the past winter to ship out as coal stuff shoveled into railroad cars from the old waste dumps. These sharks always get their money in advance for stuff that is absolutely worthless, or nearly so. A few years at the state rock pile is little enough for them, and I for one sincerely hope that they will be brought to book for the frauds they have practiced upon the dealers and the public."

Mr. Parker said that the members of the U. S. Coal Commission, during their recent visit to the anthracite region, were impressed with the fact that the engineering practice was all that could be desired and is far ahead of that in the bituminous fields. He said that Chairman Hammond is credited with the statement that anthracite is being produced as economically as efficient management and engineering practice can accomplish.

Labor cost rose from $1.60 per ton in 1913 to $4.05 in 1921. Engineers are busily at work devising means of burning bituminous coal without smoke for domestic use. Coke is becoming more and more of a menace to the anthracite trade, and the fuel-oil people are "as busy as dogs killing snakes" in their efforts to break into the domestic heating trade. He said it is a safe guess that the average net return for the anthracite sold in 1921 was not more than 35c. per ton, and as the average investment in an anthracite property at the present time represents about $8 to $8.50 per ton of annual output, this indicates an actual profit of barely 4 per cent on the investment. If production is to be restricted by the competition of other fuels, the cost must necessarily increase.

The news of the convention will be given in *Coal Age* next week.

Mine Workers Would Outlaw Members Who Join "Red" Organizations

The International executive board of the United Mine Workers of America, in session in the international headquarters of the organization at Indianapolis, June 21, issued instructions to all district officials to institute proceedings at once to place on trial any members who are affiliated with any of the movements seeking to undermine the strength of the union or affiliated with any of the "red" organizations.

The statement in which the instructions were embodied was issued after the board had considered a report presented by a subcommittee, which describes in detail the plans of the Nova Scotia district of the organization to affiliate with the Red International of Moscow, Russia.

It also denounces the "progressive international committee of the United Mine Workers of America," which is reported to be headed by Alexander Howat, a Kansan who has been attempting to overthrow the present régime in control of the United Mine Workers for years; William Z. Foster, Thomas Myerscough and Thomas Ray, all of the Pennsylavina district, as an organization which is attempting to gain control of the United Mine Workers' organization with the intention of overthrowing it.

Assigned-Car Practice Overthrown

The railroad practice of giving a preferential car supply to those mines which furnish railroad fuel was overthrown on June 27 by a formal opinion handed down by the Interstate Commerce Commission.

In summarizing this opinion the commission said: "The practice of the respondent in assigning private cars on systems or foreign-line cars for railroad fuel to bituminous-coal mines in excess of the ratable share contemporaneously distributed to bituminous-coal mines upon their lines which do not receive assigned cars is found for the future to be unjust and unreasonable and unduly and unreasonably prejudicial to mines not receiving assigned cars in favor of mines which are furnished such ars in excess of ratable proportions. Cars specially placed by order of the commission under provisions of paragraph 15 of Section 1 of the act may properly be treated as assigned cars and these need not be taken into account in determining the ratable distribution when order of placement so requires."

This constitutes an express victory for the National Coal Association, which took the lead in challenging this practice of the railroads. The association received important help from the United Mine Workers of America.

I. C. C. Bans Virginian Ry. Extension; Too Many Mines Now, It Holds

Because the Virginian Ry. has more coal mines on its roads than it can serve efficiently the Interstate Commerce Commission on June 25 refused that road permission to construct an extension of its lines in Wyoming County, West Virginia to serve mines being opened by the Pocahontas Fuel Co. This is considered to be the first decision of the commission under the new powers conferred by the Transportation Act to limit railroad extension for reasons other than financial.

The contention was made by the commission, it is said, that fewer mines would produce more coal, because rail equipment and facilities could be better concentrated. Another point was that during the last year there were twenty-eight weeks in which the Virginian Ry. was unable to supply more than 50 per cent of the cars needed by the mines in existence.

Work had already been started by the Virginian Ry. on the proposed branch, which was extended along the Guyandot River Valley.

No formal announcement was made by the commission besides the fact that the application had been denied, but it was indicated that the commission would, within a few days, make a full report, giving detailed reasons for its action.

The Pocahontas Fuel Co. has a 5,000-acre tract on the Guyandot River now developed by two mines on the south side. The extension asked for by the Virginian is less than half a mile in length, to cross the river and permit the opening of coal on the north side thus allowing the complete and proper development of the whole tract. There is nothing to prevent the coal company from doing at its own expense that which the Interstate Commerce Commission prohibits the railroad from doing.

President Says Coal Commission Will Bring New Understanding of Fuel Problem

President Harding told an audience at Cheyenne, Wyo., on June 25, on his trip across the country, that he is opposed to nationalizing the coal mines. "That," he declared, "would only be another step to the national paralysis which a sane America will everlastingly avoid."

Referring to the forthcoming report of the U. S. Coal Commission, the President said: "It is too early to say whether the commission will suggest plans of permanent cure which the Congress will adopt. I do know that it will bring us to a new understanding of a problem which must be solved. We shall have a publicity which will make greed impossible and point the way to solve a question which must be answered in behalf of a vital public interest.

"Meanwhile, we shall better guard against inconvenience and hardship if the consuming public will help as best it can, without expecting the government to assume all the responsibility.

"If the coal-consuming world would buy coal during the periods of scant consumption it would guard itself against price panics and dangerous shortages when consumption is at the peak. In the hope of lower prices, the buying is postponed and that very postponement is contributing to a decided price increase. There is need for some individual initiative and responsibility in preparing for the wintry days to come. There is a mistaken notion that somehow the government may wield a magic wand or strike with the iron hand, and produce cheap coal. It can do neither.

"Many mine operators, who were as much responsible for the strike as the workmen who struck, insisted that under law enforcement they could produce all the coal that was needed. The law enforcement was provided but no coal was produced."

Federal Trade Hearing on Charges Against Dock Association Drags Along

The hearing on the charges by the Federal Trade Commission against the Northwest Coal Dock Operators' Association is still under way in St. Paul. The evidence offered by the commission for the first week or more was largely documentary, consisting of letters and circulars issued by the dock association in the past, minutes and records, which are assumed by the prosecution to establish the charges made of price fixing, collusion, credit information, and steps toward monopolizing the coal business of the district.

Among the witnesses were: W. H. Groverman, for years secretary of the Northwest Coal Dock Operators' Association, who was asked to identify numerous letters and other documents; and a number of other well-known coal men.

Anthracite Miners Convene at Scranton to Prepare Wage Demands for Coming Year

Anthracite mine workers met at Scranton on Tuesday, June 26, to consider the demands they will present to the operators in the negotiations for a wage scale to replace the present one, which expires on Aug. 31 next.

Interest lies chiefly in whether the miners will renew their 1922 demands for a 20 per cent wage increase or will concentrate their effort on obtaining the check-off, which also was demanded last year. Some of the union leaders were of the opinion, it is reported, that most of the 1922 demands, none of which was obtained after a five months' strike, would be renewed. It is expected that negotiations will be opened by the miners with the operators immediately after July 4, when with the miners' demands and the report of the Coal Commission before them, progress can be made in reaching an agreement before the present one expires.

Change in Southwestern Rates Suspended

All new rate schedules filed with the Interstate Commerce Commission by Southwestern railroads previously ordered to become operative on June 30 revising freight charges in the lower Mississippi Valley and in the Southwest under decisions rendered in the Memphis-Southwestern investigation were suspended on June 22 by the Interstate Commerce Commission until Oct. 28 next.

Complaints by shippers, the commission said, have produced "sufficient showing to indicate that the suspended schedules produced increases in present rates not authorized or required by the decision." Further, the schedules contained a large number of errors and failed to conform to the commission's requirements.

The railroads concerned were instructed to confer with a shippers' committee on a second revision. General freight agents of Southwestern railroads were named on a committee to represent the carriers, and the commission asked for a report by July 20 on the possibility of reconciling differences. If the schedules can be corrected, the commission will vacate the suspension and allow new schedules to go into effect.

Harding and Daugherty Write to Coal Commission; Sequel to Capellini's Election Seen

By Paul Wooton
Washington Correspondent of *Coal Age*

Two letters of unusual importance were received by the U. S. Coal Commission last week. One was from President Harding urging the importance of an agreement being reached in the anthracite field. The other was from the Attorney General pointing out that it would be in violation our statutes if the alleged agreement exists whereby British coal diggers would not mine coal for shipment to the United States during a strike here and whereby the American union would conduct itself similarly during a strike in the British Isles.

It is apparent that the commission made no mistake in the appraisal of the value of the two propositions. The daily press attached great news value to the Attorney General's letter, but gave only incidental attention to the letter of President Harding. The President's letter undoubtedly was prompted by the election of Rinaldo Capellini to the presidency of District No. 1 of the United Mine Workers of America. This victory for the radicals among the workers in the anthracite region reaffirms the presence of a dangerous unrest among them, which had its first outbreak in the demand for nationalization. The fact that the radicals are in the saddle in District No. 1 increases greatly the difficulties which must be overcome before a settlement is reached. The President evidently caught the true significance of Mr. Capellini's election. The Coal Commission is even in a better position to know its important portent. That is why its members apparently attached so much importance to the letter from the White House and seemingly dismissed the letter from the Department of Justice with the statement that they have no information as to such a contract. Chairman Hammond stated positively that John L. Lewis on appearing before the commission, after his return from Europe, gave no intimation of having negotiated any such agreement.

A generally held opinion among coal specialists in Washington is that no such contract exists. The principal reason for believing that no such agreement was negotiated is the fact that Mr. Lewis is not in a position to control exports of coal. The coal which would move to England were the demand sufficient, is produced almost exclusively in non-union fields. The only way he could influence that movement would be to call a strike simultaneously with the British so that the non-union production would be required to meet the requirements of the domestic market, which naturally would have first call on this coal.

The report on Mr. Lewis' return that he had reached some such understanding with the British was not taken seriously by those really acquainted with the coal industry. Mr. Lewis has reached that degree of prominence that he cannot take a vacation without the comment on his visit being replete with speculation as to its purpose. If Judge Gary goes to Europe, articles are printed intimating that he is about to enter into some agreement with Mr. Stinnes or some other steel manufacturer with the idea of lessening competition. In similar fashion, when Mr. Lewis, another industrial magnate, goes abroad, there must be some sinister purpose. The real facts probably are that Mr. Lewis went to Europe on a much-deserved vacation. Naturally he saw the leaders of the British coal miners' organization. It would have been a discourtesy to them had he not done so. They may have talked a little shop, but the chances are that the matter of curtailing coal shipments during strikes was not even mentioned.

For these reasons the Coal Commission naturally may be expected to pay close attention to the imminent thing, referred to in the President's letter, and relegate for opportune consideration the rather fantastic suggestion of the Attorney General.

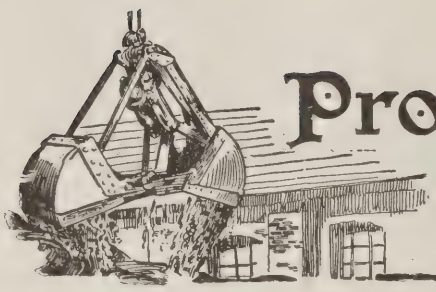
The importance of the report which the commission will make on anthracite has been increased many fold by the election of Mr. Capellini. When the situation was under the control of the conservative leaders, whose policies and attitude were well known from their long service, it was comparatively easy to forecast what might be expected. The general impression that there would be no strike this year in the anthracite region was based on the knowledge of the conservative policies of such men as Brennan and Kennedy. With the control wrested from their hands, there is doubt as to what the rabble in the union may demand.

Text of President Harding's Letter

The full text of the President's letter, which was addressed to Chairman Hammond, is as follows:

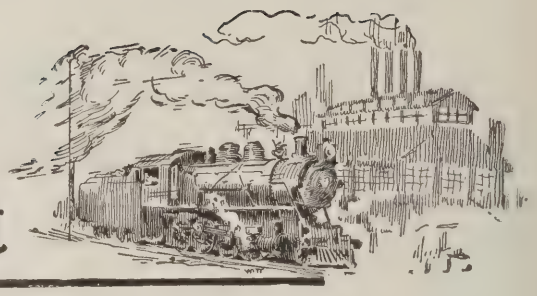
"In acknowledging your brief statement of the progress of the work of the Coal Commission, I wish to express again the high value I put upon the work you are doing. Though this is the season of the year when both temperature and vacation habits may tempt the average citizen to dismiss the subject of coal, the issue remains a serious one, and I therefore bespeak for the forthcoming report of your commission on the anthracite industry a most thoughtful reception. No solution of this vexing economic question can be found except as the general public thoroughly digests the facts you present and decides upon the proper action to take.

"I regret that those who serve the anthracite-consuming public as mine operators and mine workers have not already agreed upon the terms of a new contract, but with your report available on July 1 there should be no delay in reaching a speedy agreement. The public deserves prompt assurance that there will be no interruption after Aug. 31 in the flow of household coal from mine to market.



"As I believe your commission stated in an earlier report, industry and the home alike must be freed from the menace of constant interruption of their coal supply. To that end public opinion must be a well-informed public opinion, and I therefore trust that our citizens may keep up a lively interest in coal in season and out of season. The subject is a most interesting one, but it is much more; the issue is a vital one in that it affects the well-being of the whole nation, and not in a material way alone, for I know questions are before you that strike deep into the very heart of our American institutions."

The full text of Attorney General Daugherty's letter, also addressed to Mr. Hammond, is as follows:



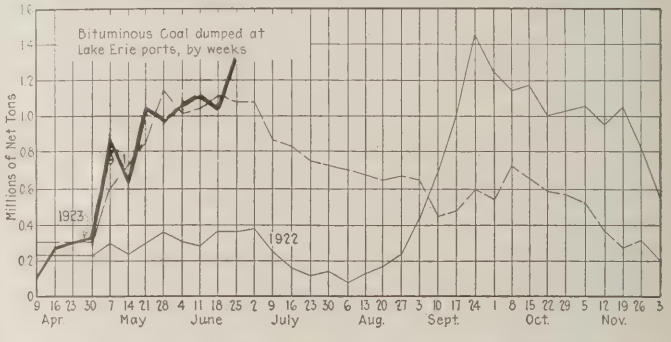
"My attention has been called by publication and otherwise to what is claimed to be a contract entered into or proposed to be entered into between certain officials of the United Mine Workers of America and others in this country with certain officials of a similar organization and others in foreign countries, represented to provide and to agree that in event a strike should be declared or in force in this country in the mining interest, no coal would be mined for shipment to this country by miners belonging to said organizations in such foreign countries during the period of a strike that might be in force in this country.

"I can hardly conceive that any person in this country would enter into such a contract, for I am satisfied that such a contract would be a violation of our laws. If coal were required for transportation purposes for use in interstate commerce in this country, any such interference with the supply of coal will be prevented by the Government of the United States promptly and forcefully.

"I shall be glad to be promptly advised as to the facts in possession of or obtainable by your commission in order that such action may be taken as is justifiable."

Production and the Market

Weekly Review

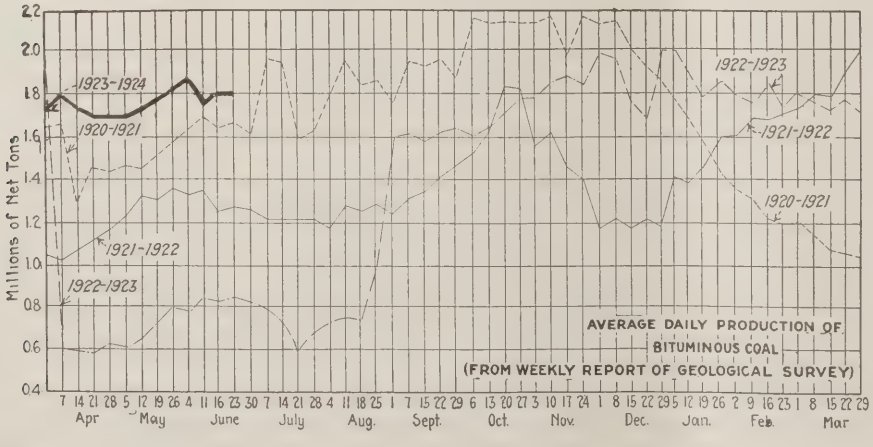


Signs are not lacking that the production of bituminous coal, which has been sustained at an average of 10,500,000 tons per week through the first half of the year, is due to fall off during July and August. Industrial revival is receiving a setback in the decreasing activity of the New England textile plants, where retrenchment in production of cotton goods has been going on quietly for the past two months. It is reported that the steel industry around Pittsburgh will suspend operations for the entire first week of July, ostensibly because of hot weather and Independence Day celebrations. In fact, however, buying of steel has not kept pace with production, and with decreasing orders on the books the steel industry is understood to welcome a week's vacation.

Production of bituminous coal at the rate of 546,000,000 tons per year is generally conceded to be well above consumption and it is well known in the trade that buyers have been taking in coal for storage in considerable quantities in the past two or three months. The movement to store coal is losing its impetus with hot weather and declining prices. Around St. Louis interest in piling up reserves has fallen off and at Chicago the large industries are now putting their money into low-priced "no-bills." In New England, buyers are cancelling orders placed last month. Buyers in this territory have been successful in beating the price down by playing Southern coals by water against Pennsylvania all-rail coal.

An ever-present prescription for active summer production—the Lake trade—also is due for an early slump. Accumulations at Lake Erie ports are now practically double normal, while the market for Eastern coals in the Northwest is being seriously challenged by all-rail coal from Illinois.

Coal Age Index of spot prices of bituminous coal at the mines for the second week in succession declined five points, standing now at 205, which corresponds to an average mine price of $2.48. The price will continue to fall so long as production is maintained at the present level, for there is not sufficient tonnage under contract to warrant operators throwing additional output on the market at prices that in a great many instances do not return cost of production. Shippers to New York Harbor have put on the brakes and accumulations at the piers are now sufficiently low to steady the price.



According to the Geological Survey the production of bituminous coal in the week ended June 16 was 10,775,000 net tons with approximately the same figure in the week ended June 23. The total for the six months ending with June will thus be approximately 273,000,000

net tons. Each week there is less complaint of car shortage and lack of demand has become the dominant factor limiting production, save in a strip of territory in the Appalachian fields from eastern Ohio south to Fairmont, southern West Virginia and through to eastern Kentucky and Tennessee, where the operators report demand for cars in excess of those furnished.

At Hampton Roads dumpings are steadily declining, both exports and New England shipments falling off. In consequence, the price of Pocahontas coal has been beaten down severely in the last few weeks.

Lake coal dumped in the week ended June 25 was the

(*a*) Subject to revision. (*b*) Revised from last report

highest recorded this year and very near the top record of any year. Cargo coal was 1,278,428 net tons and fuel coal 66,052, a total of 1,344,480, which brings the total for the season to date as over 9,253,000 tons.

The anthracite market is exceedingly active; production is at high level and distribution is keeping pace with production. Dealers are contending for coal on the one hand and competing for customers on the other.

The beehive coke market is easy because the merchant furnaces are uncertain about third- and particularly about fourth-quarter business. Both beehive and byproduct output, however, continue high.

Chicago Trading Is Stagnant

Coal continued to drag bottom in the Chicago market during the past week. Nothing was in demand except a fair volume of anthracite and smokeless for a slightly reviving domestic trade. Bituminous steam-coal consumers took what there was on the tracks at rock-bottom prices, thus relieving most mines of no-bills. However, buyers evidently consider this a market strictly belonging to them. Nobody is making any money on coal. The storage movement, which gained headway in this section only through the purchases of the Illinois Central, the Burlington and Big Four railroads and a few industrial plants, shows no sign of spreading. Northwest trade won by Illinois and Indiana shippers is proving a lifesaver for many a coal concern. However, dock operators are bidding strong to end the rail invasion of their old time territory.

Field reports from Illinois are that second-grade screenings in Williamson County have been selling down to $1.40 though that is far below the circular. But for that matter, independent operators have been undercutting the circular more than $1 on domestic sizes. Persistent reports of $3.75@$3.85 lump coal even from the association mines have spread over the Middle West. Independents sell nut and egg for $2.50@$3 and lump for $3@$3.25. But there isn't much business even at that price. Exceptional indeed is the mine that works over three days a week.

It's Warm in St. Louis

The warm wave which hit St. Louis during the week practically put an end to storage coal. It got the customer away from the thought of coal and it brought relief to the dealer because of the threat of a drivers' strike. Anthracite and smokeless for St. Louis have been practically shut

*Net tons, f.o.b. mines †Advances over previous week shown in **heavy type**, declines in *italics*.

Coal Age Index 205, Week of June 25, 1923. Average spot price for same period, $2.49. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

off with the claim that it must move eastward. Arkansas anthracite is hard to get on account of no market for the steam size. The coke situation eased up some and a little is available, but it is not being put in.

The coal that is moving best is Carterville, but not in any volume. The school coal is being put in and a little apartment house Standard, but Mt. Olive is not moving.

Kentucky Market Weaker

Further weakness was shown in some sizes over the past week, eastern Kentucky lump coal of the non-gas varieties slumping slightly, while screenings are a shade weaker. A fair movement is reported to the Lakes, which is causing weakness in screenings.

It is asserted that there is not much Lake business on the open market; it all being well pooled, or contracted with the big operators, while there is not much steel or big business reaching the open market. Byproduct buyers are not active.

General industrial business is being made up of numerous small orders, with a fair volume going to public utilities, which are meeting with a good current consumption. Railroads are giving Kentucky fields 95 to 100 per cent car supply.

Marked irregularity in the steam-coal market has taken place at the Head-of-the-Lakes and a drop of 50c. has come in all grades except screenings. The lack of demand has never been so noticeable at this time of year as it is at present, according to dock men, who report business at a virtual standstill. Strange as it may seem, in view of last year's suffering in hard coal, there is little demand for anthracite.

The Milwaukee market continues very quiet. Jobbers report absolutely no demand in the country. Prices on coal and coke are firmly maintained at the May schedule. Whatever cutting is being done in soft coal is kept well under cover. The inflow of coal by lake continues satisfactory.

At Minneapolis out of the scramble for business by all classes of all-rail and dock interests, there is developing a small amount of contract tonnage. This is proving somewhat surprising, for the rail trade has assumed that it had the dock trade beaten by better than $1 on steam coals.

Colorado Prices Stiffen

The price of bituminous coal was increased 25c. by all Colorado operators July 1. Lump coal from Walsen and Canon City is selling at $5.25 compared to the July price of $5.50. Nut coal is selling at 50c. less. No change has been noted in the price of mine run at $4 and slack at $2.50. Lump coal from Trinidad sells at $4.50 and nut at $4.25.

The cold snap of the past few days at Salt Lake City has made retailers busy filling small orders. Storage business has not increased. Production is increasing and the mines are working around three days a week.

At Kansas City with the prospect of another hike in the price of domestic grades of coal July 1, there still is no evidence of increased storage. A little threshing coal is moving more briskly as the harvest moves north. There is scarcely enough business to keep mines operating one day a week.

Slowness Pervades Ohio Markets

The trade at Columbus continues dull and quiet. Buying is at low ebb and large users, especially of steam coals, are content to buy in the open market. Lack of demand has caused many mines to close down. Railroads are good buyers. Contracting for large tonnages is not active and efforts to make renewals have not met with much success. The market at Cincinnati is slow. There is plenty of coal to be had but buyers are not in the buying mood. Demand for domestic 4-in. lump and block has fallen off. Quotations for West Virginia 2-in. lump on June 25 was $2.50@$3, as compared with $2.75@$3 the previous week, and for southeastern Kentucky 2-in. lump $2.50@$3, there being no change from the previous week's quotations. Demand for the steam coals in the Cleveland market has dwindled to a standstill. Operations at some of the mines has been curtailed because of the lack of orders, while others have been closed entirely. The retail trade is quiet. Production in the eastern Ohio No. 8 district for the week ended June 16 was 414,000 tons, a decrease of 9,000 tons from that of the preceding week.

The spot market at Pittsburgh is easy, with prices at about last April's level. While production is less than it was early in the month, it is still above that in the early part of the year, the increase being represented in the demand for lake trade.

Buying at Buffalo is slow. Consumers are in no hurry to buy.

Dullness Marks New England Market

The New England steam-coal market is settling down into old-fashioned midsummer dullness. Buyers are not interested, and in spite of declining prices there are few who will avail themselves of opportunities to stock coal for the fall and winter. Purchases made a month ago do not look so good, and in more cases than might be supposed there have been requests to suspend shipments, and even cancellations where buying had been more extended than justified by the current rate of consumption. A great many manufacturing plants are curtailing, and each day we hear new instances where textile mills have been obliged to shut down either for two or three days a week or for a period of two to three weeks together.

Pocahontas and New River grades are in ample supply at all points, with Hampton Roads prices softening almost from day to day; $5.75 per gross ton f.o.b. vessel is now an open figure for Navy Standard coals and several of the

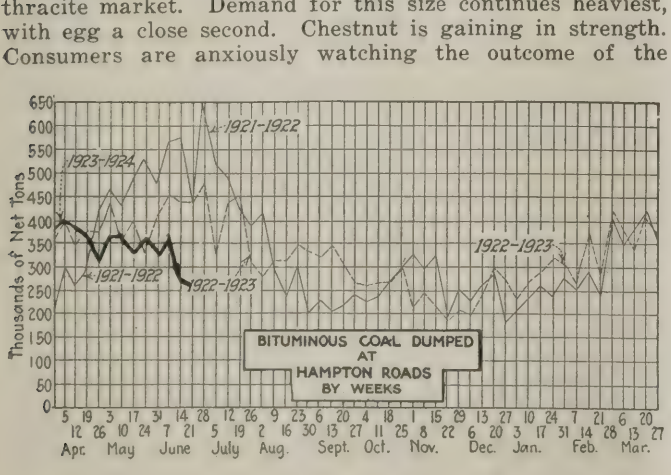
agencies are making quiet canvasses to place output for the time being at a figure materially less. This condition naturally is being reflected at this end, where coal offered for inland delivery has now been sold well down to $7 per gross ton on cars Boston, Providence, or Portland.

Inquiry for the central Pennsylvania coals is correspondingly light. Strenuous efforts are being made to place current output, but even at well-shaded quotations there is little interest on the part of steam users. Enough tonnage was bought all-rail to show the Hampton Roads agencies that price returns are not wholly in their control.

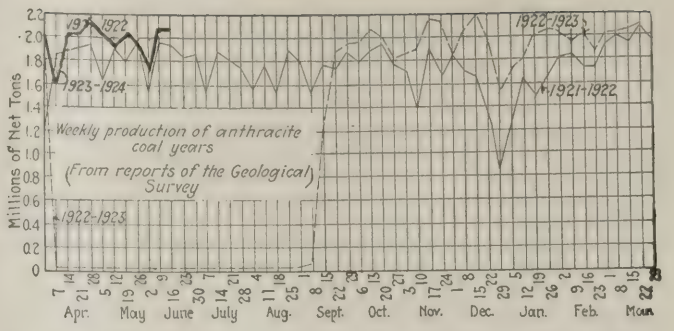
The heavy volume of steam and gas coals that has been characteristic of the Philadelphia piers the past 60 days has now begun to decline. The pressure to get shipments forward has relaxed. There is something of a tonnage at the piers "on consignment" for which no disposition is at hand, and from rumors in the trade there are some bargains to be had in quality grades, both from Somerset and the Cambria districts.

New York Market in Better Shape

Decreased shipments to tidewater has placed the New York market in better shape. Receipts at the terminals have been reduced and there is less coal in boats. Local shippers do not look for a revival until about September. Little interest is being shown in the Philadelphia market and spot sales are limited. On the other hand, contracts are being kept in most instances. Unless custom is reversed shippers expect consumers, as in former years, to begin to lay in a little extra tonnage in July.



There is little activity in the soft-coal market at Baltimore, although for the first time in several years the bins of over one hundred school buildings have been filled and it is expected that fifty others will be filled by Aug. 1. Industrial-plant owners, however, seem to entertain no uneasiness as to their ability to get coal when needed.



At Birmingham scarcely any new business is being taken on. Inquiry is limited and orders booked are small. Consumers are taking only enough coal for immediate requirements. Domestic business is good but operators are handicapped by the slowness of the steam-coal market.

There arrived at Duluth last week fifty-nine cargoes of coal of which five were anthracite. Only seventeen, however, are reported en route from the lower lakes, of which but two are anthracite. Stocks on the docks on June 15 were estimated at 2,100,000 tons of bituminous coal and 175,000 tons of hard coal. So far, cargo receipts at Milwaukee aggregate 239,819 tons of anthracite and 925,951 tons of soft coal, or about 44 per cent of the total amount received during the navigation season of 1922. Demand at Pittsburgh for lake coal has been poor due to the large quantities on docks and in transit. Shipments of anthracite from Buffalo for the week were reported at 93,500 tons, of which 38,600 tons went to Duluth and Superior, 19,600 tons to Chicago, 14,500 tons to Manitowoc, 11,000 tons to Milwaukee, 5,000 tons to Two Rivers, 3,000 tons to Sheboygan and 1,800 tons to Racine.

Lack of Stove Size in Anthracite Market

Lack of stove coal is the outstanding feature of the anthracite market. Demand for this size continues heaviest, with egg a close second. Chestnut is gaining in strength. Consumers are anxiously watching the outcome of the

miners' convention being held this week in Scranton. In New York and Philadelphia retail dealers are urging their customers to take in a small portion of buckwheat coal. Supplies are being received slowly at Baltimore.

"Anthracite production was well maintained during the second week of June," says the Geological survey report, "and again passed the 2,000,000-ton mark. The nine principal anthracite carriers reported loading 39,249 cars and with this as the basis the total output was estimated at 2,053,000 net tons. In addition to the tonnage shipped, this estimate includes an allowance for mine fuel, sales to the local trade, and the output from dredges and washeries.

"The cumulative production during 1923 to date, which stands at approximately 47,245,000 tons, compares favorably with the years of maximum production, and is considerably more than twice the output during the corresponding period of 1922."

Beehive Coke Output Drops 4 Per Cent

The Geological Survey in its report says: The production of beehive coke declined somewhat in the week ended June 16. Using as a basis the number of cars loaded, the total output is estimated at 390,000 net tons. Compared with the 406,000 tons produced in the week preceding, this was a decrease of nearly 4 per cent. The reduction occurred principally in Pennsylvania and Ohio.

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

Foreign Market And Export News

British Coal Production Declines Slightly; Welsh Situation Unsettled

Coal output of Great Britain's mines during the week ended June 9 was 5,654,000 tons, says a cable to *Coal Age*. This was 73,000 tons less than the previous week's production. Quotations for most grades for the week ended June 23 also show a decline from the previous week.

The general situation in Wales is somewhat unsettled. Prices are slightly lower and buying is of the hand-to-mouth variety. The three-shift working has come into operation at the Welsh docks, except Newport, where the decision to work extra time has been deferred temporarily. Inquiries from abroad continue to be substantial, particularly from France, Italy, Egypt, South America and the coaling depots.

The quiet tone of the north of England market continues, due to erratic exchange movements, congestion of European ports of discharge, and impending developments in the Ruhr.

Upon his return to London from the United States Sir David Llewellyn, a Welsh coal-mine operator, announced, according to a cablegram, that he had made contracts for shipping to the United States 1,000,000 tons of Welsh anthracite yearly for five years.

A cablegram from American Commercial Attaché Tower at London to F. R. Wadleigh, Federal Fuel Distributor, at Washington, dated June 20, states that the coal trade at Newcastle is reviving and that the Prime Minister had been requested to appoint a committee to investigate the coal industry. It was thought that this would satisfy the forces opposing the minimum wage bill and avoid a crisis if the bill fails to become law.

French Market Shows Little Change

Very little change is to be noted since last week in the situation of the French coal market. If anything, the industrial demand is slightly quieter than it was two or three months ago. However, mines of the Nord and Pas-de-Calais have booked for June nearly the same volume of orders as they had for May and none of them seems to have anything to dispose of for prompt delivery.

There is an extremely active demand for domestic coals, which is rather unusual at this time of the year. The strike of Belgian railwaymen—called off on June 1—which has indirectly caused some depletion of stocks of Belgian coals at Paris retail coal dealers, contributed, no doubt, to this activity.

An insufficiency of railway stock supplies is reported, as well as a rise from 20f. to 21f. 50c. in the canal freight rate on coal from Bethune to Paris.

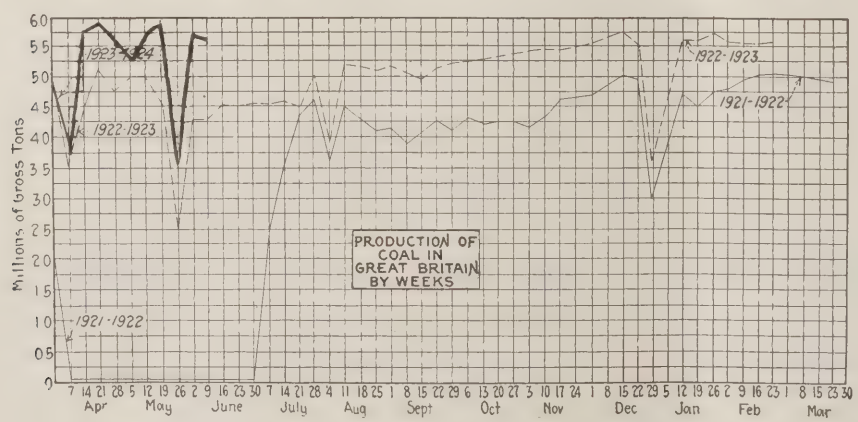
Coals from the Saar field are coming in again on the French Eastern markets.

Prices and Dumpings Lower at Hampton Roads

Business at Hampton Roads reacted last week, to a seasonable dullness which was anticipated by shippers. The piers seemed likely to reach the low level in dumpings for the last twelve months, and gave indications that the month's movement would fall 500,000 tons below the corresponding period of last year.

Heavy movement of coal to the West by rail over the Norfolk & Western and Chesapeake & Ohio was held largely responsible for the slowing up of business, supplies on hand having dwindled to a low point. Prices were being forced steadily down, reaching the low level for the year.

The absence of contracts was one of the features of the market. Shippers did not expect any material revival of business for the next thirty days, but were prepared for the dullness which had set in.



Germany Receives Heavy Coal Imports

During the first three months of 1923 there were imported into Germany 6,689,617 metric tons of coal and 115,675 tons of coke, as compared with 641,792 tons of coal and 3,235 tons of coke in 1922. Importations during the corresponding period of 1913 were 2,177,843 tons of coal and 139,996 tons of coke. Of the coal received in 1923 Great Britain furnished 2,382,687 tons, Polish Upper Silesia, 4,046,141 tons, Czechoslovakia, 119,290 ton and the Sarre district, 103,371 tons.

Since the Ruhr blockade Germany with regard to coal supply, has been divided, the occupied zones which are self supporting, and the interior which is strongly dependent upon imports.

It is estimated that the ordinary supply from the Ruhr to the interior of Germany was about 4,000,000 tons monthly, but the present situation has been relieved by business depression, running import contracts exceeding the demand.

Imports of coal by months so far this year have been: January, 1,870,127 tons, February, 1,421,832 tons and March 3,397,658 tons.

News Items From Field and Trade

ALABAMA

Extensive improvements and rehabilitation are in progress at the Townley operation of the Corona Coal Co. preparatory to reopening No. 1 mine, which has been idle for about two years. **The comany expects to begin producing coal again about July 1.**

COLORADO

The effort of Mary L. Milheim and other property owners to have the act creating the Moffat Tunnel Improvement District of Colorado declared unconstitutional failed when the U. S. Supreme Court, in an opinion read by Associate Justice Sanford, June 11, affirmed the action of the State Supreme Court of Colorado in ordering the suit dismissed. The tunnel was declared to be clearly in the public interest, although it might be, as the complainants had asserted, intended for the special benefit of the Denver & Salt Lake R.R., commonly known as "the Moffat road." The act created a special improvement district, with power to issue bonds of $6,720,000 to tunnel the Continental Divide near Denver, for a railroad and roadway. The Commissioners of the district were empowered to determine the benefits which would accrue to nearby property and to assess this property in proportion. They declared the benefits to be valued at 15 per cent of the assessed value of the property, whereupon a number of property owners joined in a suit to test the constitutionality of the act.

Railroad companies involved in the recent decision of the Colorado Public Utilities Commission lowering freight rates on coal in Colorado have appealed to the Interstate Commerce Commission, and a hearing was scheduled to be held in Omaha, Neb.

ILLINOIS

The Beatty mine at Mascoutah has been closed down for an indefinite period. Officials of the concern do not give the reasons of the shutdown.

The troubles of Mortimer B. Flynn, of Chicago, member of the firm of Pottinger, Flynn & Co., retailers, are many. He not only had trouble with the city of Chicago when a special grand jury investigated the charge that the firm had grossly overcharged the city for coal, but the Federal Government now seeks to prove that Mr. Flynn evaded income tax on an amount in excess of $400,000. Together with J. Roy Troutman, his auditor, who went to jail rather than turn over the books of the company to the grand jury last fall, he last week surrendered on a secret indictment charging conspiracy to defraud the Government.

Agents supposedly of the Great Northern Railroad have bought a tract of land near Herrin with the intention of opening a new strip mine. The land was purchased from C. C. Russel, of Herrin, and it is announced that the railroad company is now setting machinery and equipment in preparation for starting operations at once. The vein under the tract has an average thickness of seven feet.

The town of Nason, near the new mine of the Illinois Coal Co., was opened June 10 with a boom. Lots are being sold at $1,100 for business locations, while the resident lots are held at from $300 to $200. Many miners are said to be planning to move to the new town and erect houses.

Three judgments have been filed against the Star Coal & Mining Co. of Belleville. These are as follows: The Ottumwa Iron Works, $4,804.60; the First National Bank, Belleville, $1,606.25 and the First National Bank, Belleville, a second one for $6,330. Judge Crow decreed the foreclosure of two mortgages on the mine, allowed the claims of miners totaling $8,027, and also allowed various mechanics' liens. A mortgage is held by the Lake & Export Co., of Chicago, for $31,000 and another for $3,000 by the First National Bank of Belleville. Immediate sale of personal property belonging to the company has been ordered. The date for the public sale of the mine property has not yet been fixed.

An order to sell the assets of the Star Coal & Mining Co. of Freeburg, has been issued by Circuit Judge Crow of Belleville. B. S. Glenn was named as receiver. The order was issued to benefit two mortgages and claims of the miners employed at the mine. The mortgages total $35,000. The mine owned by the defunct company has not been operated for some time.

The office of the Monmouth Coal Co. at Brereton has been destroyed by fire. The loss was about $3,000.

Traveling Auditor A. T. Pace, of Herrin, has been notified of his **reappointment by the United Mine Workers of America** for a period of another two years.

INDIANA

Three suits were filed in Federal Court at Indianapolis, June 20, **against the United Mine Workers of America** for damages amounting to $10,000 each **for the death of three guards who were killed by rioters at Herrin,** Williamson County, Ill., about a year ago. The suits allege that mismanagement of the strike by the United Mine Workers and officials of the organization were responsible for the riots which resulted in the death of the guards. The suits were filed by relatives and estates of the dead men.

The Princeton Mining Co. has been incorporated at Princeton, Ind., with a capital stock of $200,000 to enter the operating field. The incorporators are J. G. Applegate, Floyd J. Biggs and Harlen L. Kays.

The Railroad Third Vein Coal Co. has been organized in Indianapolis for the purpose of prospecting in coal lands. The company has an initial stock of $20,000 and the organizers are Edwin J. Marott, L. H. Noble and J. E. Keller.

IOWA

The Board of Supervisors of Polk County, have brought **suit against the Bloomfield Coal & Mining Co. for $250,000. The coal company is accused of having mined coal under the buildings on the Polk County poor farm,** between Des Moines and Ankeny, and it is said that the buildings are settling. Cracking walls and unsteady foundations have caused serious damage to the county hospital buildings.

KANSAS

A report of 1922 tonnage in Kansas, made public June 11 by P. E. Keegan, statistical clerk in the office of the state mine inspector, shows that **the 1922 tonnage in Kansas was 510,381 less than in 1921.** The tonnage for 1922 was 3,518,243; that for 1921 was 4,028,624. To produce this tonnage last year, his report further shows, the mines of the state were worked an average of 139 days. The total number of employees of all kinds about the mines was 9,626. The report for 1921 showed that in that year 10,416 men were employed at the mines, who worked an average of 151 days.

KENTUCKY

The towboat Julius Felischman with a coal tow for the Falls Cities arrived at Louisville the last week in May from the Kanawha (W. Va.) fields, the tow going to several riverside companies in the district.

Willis M. Johnson, of the Emmett O'Neil Coal Co., reports that his company is installing a 45-ft. Barber Green coal conveyor in the local yard of the company. This company also is making coke at its yard, using the Bussey process.

The Louisville Gas & Electric Co., which operates a tipple mine at Echols, **has purchased additional property near its big generator plant on the river front at Louisville,** and has asked the city to close two small alleys which run through its property. The company is planning **to enlarge its coal-storage facilities** in Louisville so that it can store nine weeks' coal supply, instead of three weeks'. This property is below street level. This makes it possible to submerge the fuel supply in event of fire. A permit is to be requested for an overhead track across Third Street for the use of a locomotive crane. The new storage facilities will have a capacity of around 35,000 tons it is reported.

MASSACHUSETTS

The Island Creek Coal Co., Boston, which earned more than $26 a share on its outstanding common stock in 1922 as compared with about $20.50 in 1921, and nearly $69 a share on the preferred against about $55 in 1921, **will have disbursed $32 in cash dividends in the past eighteen months with a payment of the $2 regular dividend and $3 extra on the common on July 2.** The policy of the company of late is such as to indicate that it will distribute in dividends substantially its entire earnings. The preferred stock is $16, cumulative with par of $1, and the common, of which there is outstanding 118,802 shares, also has par of $1. At the annual meeting of stockholders on April 11 last it was voted to permit directors of the company to purchase outstanding preferred stock at not exceeding $105 a share for cancellation.

MINNESOTA

The franchise which was granted **for a central heating plant in Duluth was revoked** by negative action of the City Council May 21. The franchise provided that work must start in one year. When the time limit expired on May 20 the City Council declined to extend the time limit. The council's action was by a four to one vote. The heating plant would have cost in the neighborhood of $1,000,000 and would have served the central portion of the city.

T. F. Walker, for many years employed by the **C. Reiss Coal Co.,** at the company's dock at Ashland, Wis., **has been made manager to succeed Martin Schrank, resigned.** Mr. Schrank was manager of the docks at Ashland for 23 years. The announcement of the appointment was made by Peter Reiss, president.

A jury in the Marion Circuit Court at Minneapolis May 21 awarded to the Panhandle Coal Co. and the Linton-Summit Coal Co. **a judgment for $13,938.03 against the Indiana Railways & Light Co.** of Kokomo for coal bought by the latter concern under a contract made in 1920 when the federal government's rule of assigning privilege cars to the public utilities was in effect.

MISSOURI

The Powhatan Coal Co. is developing a new acreage near Huntsville in anticipation of a good fall demand.

The National Steel Rail Co. has moved to new offices, suite 1006-9 Planters Building, St. Louis.

NEW MEXICO

Under the terms of a deal just consummated **Charleston (W. Va.) capitalists have control of over 500,000 acres of coal and timber land in New Mexico,** the deal involving the sale of 116 000 acres of land of the Jemez Land Co. of Albuquerque to G. A. Porter and associates. The tract just acquired is 15 miles long and 12 miles wide, a large portion of the tract being heavily timbered. Others interested with Mr. Porter are W. M. Williamson, of the Citizens National Bank; W. A. MacCorkle, Citizens National Bank, Frank Porter; Isaac Loewenstein, president of the Charleston National Bank; G. H. Caperton, coal operator; Angus MacDonald, H. M. Bertolet of the New River and Pocahontas Consolidated Coal Co. and Sol May. It is understood that the vein of coal is 16 feet in thickness and of about the same quality as West Virginia coal.

NEW YORK

The Deepwater Coal & Iron Corp., New York City, has increased its capital stock from $12,000,000 to $30,000,000.

An offering of 160,000 shares of new common stock of Burns Brothers, which was authorized by stockholders at a special meeting held June 14, is expected to be made soon. Details of the offering, it is understood, are now being arranged. The stockholders approved an issue of 500,000 shares of new common stock. Part of this will be used to exchange for the stock now outstanding. Of the balance it was originally intended that only 25,000 shares would be sold, but this amount has been increased to 160,000 shares.

Osman E. Swartz, of Fairmont, W. Va., has been appointed to succeed the late Stuart W. Walker as **chief counsel for the Consolidation Coal Co.**, with headquarters in New York City. His appointment will become effective Aug. 1. For several years Mr. Swartz has been a member of the legal staff of the Monongahela West Penn Public Service Co. He was at one time a member of the law firm headed by John W. Davis, former Solicitor General of the United States.

C. L. Couch, Erie County Fuel Administrator during the emergency, reports to the state that he is well pleased with the co-operation received from the local men and press. He states that by the use of coke, soft coal and other substitutes the fuel office was able to keep the price of anthracite from advancing. Investigation was made of 4,500 alleged illegal deliveries and 339,895 tons of domestic sizes of anthracite were delivered, responding in all to 140,000 emergency orders and receiving as many as 4,250 applications in one day for coal. No real distress was experienced anywhere.

Dividends declared and awaiting payment, as reported currently in *The Annalist* include the following coal companies:

F. M. Feiker, formerly vice-president of the McGraw-Hill Company, Inc., and more recently on leave of absence as special agent to the Department of Commerce at Washington, will be associated after his return from Washington, **with the staff of the Society for Electrical Development**, 522 Fifth Avenue, New York City. As a result of the appointment of Mr. Feiker the various branches of the electrical industry served by the society will obtain the benefit of his broad experience and background, for he will be available to act as a special counsellor to engineers, manufacturers, central stations, jobbers, contractor-dealers and publishers, and his special training and wide knowledge in the engineering publishing and public relations fields of many industries qualify him eminently for such consulting work. Mr. Feiker will retain a consulting relation to the McGraw-Hill Company, Inc., and will continue in a similar capacity his relation to the problems of personnel and organization of the Department of Commerce at Washington.

OHIO

The Columbia Coal Corporation, of Philadelphia, Pa., has contracted with the Roberts & Schaefer Co. for Marcus screen and loading machinery for its new tipple at Salineville.

The Bitzel Coal Co., of Canton, chartered with a capital of $10,000 by E. M. Bitzel, Ben V. Marconi, Micheal Rinaldi, Nick Seavelli and Earl Kopf.

John A. Morris, district manager of the Car Service Division of the American Railway Association, **has come out with an urgent demand that pooling arrangements be entered into at the lakes** in order to remove the congestion that is cluttering the free movement of empty and loaded cars. June 9 Mr. Morris issued the following statement: "Lake boats require 5,000 to 10,000 tons of coal for a cargo and there are many shippers who have been sending as low as three or four cars to the lake ports where they are sidetracked and held for a further accumulation for the same consignee because, without a pooling arrangement, coal cannot be mixed in transport. Unless coal operators get together and reduce the number of consignees indications are that the free movement of lake coal will be held up all season. Already lines have been forced to use embargoes which will remain in force until the congestion is relieved."

PENNSYLVANIA

The Western Electric Co., Inc., supply department, Philadelphia, has moved the business formerly conducted at Eleventh and York Streets to its new building, 910 Cherry Street.

The Buck Coal & Supply Co., McKees, Rocks, has been incorporated. Its capital stock is given as $5,000 and Charles M. Ellis, McKees Rocks, is treasurer and one of the incorporators, the others being John B. Beck, New Castle, R. D. 2, and David Beck, Coraopolis, R. D. 1. The purpose of the company is mining, dredging for coal and other minerals.

J. C. H. Lubken, formerly general superintendent of the coal-mining operations of the Cambria Steel Co. at Johnstown, Slickville and Washington County, has opened offices in Johnstown, where he will practice consulting mining engineering, make appraisals and prepare engineer's reports on bituminous-coal properties.

Announcement was made on June 13 of the merger of the **Erie Coal Mining Co. and the Argentine Coal Mining Co.**, involving property valued at $1,500,000. The companies own five operating mines and a large acreage of coal land in the Butler district. Edward Sophitt, of Butler, and Charles Hosford, Jr., of Butler, have been named chairman and president, respectively.

The following **coal companies were incorporated** recently at the State Department, Harrisburg: **Navy Coal Co.**, Philadelphia, acquiring coal and coal lands and operating them; capital stock, $5,000; Harry E. Bird, 15th and Market Streets, Philadelphia, treasurer; incorporators, John Barnes, Haverford; Harry E. Bird and E. L. Clarke, Cheltenham. **The Pittston Coal Sales Co., Inc.**, buying and selling and dealing in coal, Pittston; incorporators, James F. O'Boyle, Charles M. O'Boyle and M. J. Mulhill, West Pittston. **Wills Coal Co.**, Uniontown, mining and preparing coal for the market; $50,000; Thorn J. McClernan, Uniontown; incorporators, Thorn J. McClernan, Harold W. Semans and W. Clark McClernan, Uniontown. **Suffolk Anthracite Collieries Co.**, Scranton, mining, buying, selling and dealing in coal; $10,000; incorporators, H. W. Reichards, Scranton, treasurer; J. E. Crass, Jr., and R. H. Meech, Scranton. **Calumet Coal Co.**, Pittsburgh, mining and preparing coal for the market; $5,000; incorporators, J. D. C. Miller, 213 North Elizabeth Street, Pittsburgh, treasurer; C. F. Keifer, Pittsburgh, and David E. Meigs, Swissvale.

Governor Pinchot has announced but one hearing on the bills he had left with him when the Legislature adjourned June 14. This will be held July 9 on the Davis-Fowler mine-cave commission measures.

Dan Rastelli, Washington County coal miner, on June 15 **was found guilty of murder in the first degree** in connection with the slaying of J. Ross Denny, mine paymaster, in a $20,000 hold-up in December. Orlando Fabbri and John Burchianti, two others tried with Rastelli, were acquitted.

The Blanchard Coal Co., operating mines at Spruce, Pa., and near Zanesville, Ohio, has inaugurated an airplane service between the Pittsburgh office and the mines for the purpose of preventing shutdowns through delays in obtaining machinery parts in case of breakdowns.

Somerset County authorities and state troopers are conducting a rigid investigation of a **mysterious dynamiting at Jerome** May 31, when a double frame dwelling house, owned by the Hillman Coal & Coke Co., was badly wrecked. Several occupants of the building, including an infant, were badly shaken up and suffered minor injuries. The report of the explosion was heard for miles and many windows were broken in other houses nearby. The dwelling was so badly damaged that it will be necessary to rebuild the entire structure.

The one-mile tunnel being driven from Catawissa Valley into Green Mountain, near Girard Manor, to drain the Green Mountain workings of the Lehigh & Wilkes-Barre Coal Co., is **expected to be completed** by the latter part of July or early in August. The water from the workings will flow into Catawissa Creek and it is expected this will make minable extensive veins of coal.

A verdict of not guilty was returned in court at Ebensburg, Cambria County in the case **against Owen J. Flanagan**, mine foreman, charged with involuntary manslaughter **in connection with the explosion in the Riley mine at Spangler** last November, when 77 men lost their lives. The case against Superintendent William Young was not prosecuted. Judge John E. Evans presided at the trial.

State charters were issued at Harrisburg recently to the following coal companies: **Allied Mining Companies**, mining coal and clay; Clearfield, capital, $50,000; treasurer, Nena Jones Mahaffey. Incorporators: D. W. Walker, Nena Jones and J. Karl Vinson, Mahaffey. **Standard Coal Corporation**, Canonsburg, $100,000; R. P. McClennan, Irwin. The company will engage in mining and preparing coal for the market. Incorporators: R. P. McClennan and Fred E. Silvues, Irwin and James C. Greer, McKeesport.

Carl Scholz, vice-president of the Raleigh-Wyoming Coal Co., of Charleston, W. Va., in an address before the Engineers' Club at Philadelphia on June 12 declared that complete unionization of every coal field in the United States as a solution of the whole coal problem for which the miners' officials still are clamoring would be a calamity. He prposed the following solution: "Eliminate the interruptions of production and transportation, and the coal business will take care of itself, as it did for so many years when it grew so steadily and tremendously and aided in making this country the largest producer, not only of coal, but of other commodities depending upon the utilization of coal; make the union where it continues its activities responsible for the action of its officers and members; give the men the right to work that has been granted them by the Constitution; let them think of their families and home affairs, rather than to be influenced by the stranger, who has other motives in his mind, and the vexing question will be settled."

Auditor General Samuel S. Lewis announced at Harrisburg June 20 that he **has started an examination of the books and operating officials of some of the anthracite companies in order to check up values of coal** as reported to him for tax purposes and to standardize the work of making reports under the law. There is a marked difference between values returned in the anthracite reports and the receipts shown in the capital stock tax reports, he said. The Auditor General said that if the representatives of his department now in the anthracite fields are denied access to the books and records or should essential information be withheld he will have subpoenas issued.

The Workmen's Compensation Board, which has been unable to function recently owing to the fact that Paul W. Houck, acting chairman, was the only member, **now consists of two members**, and Governor Pinchot in appointing the second announced that a third, who will be chairman, will soon be named. Benjamin Jarrett, of Farrell, recently tendered his resignation as a member of the board, effective as of July 1, but as his term expired with the end of the session of the State Senate, he automatically went out of office June 14, the date of the close of the Legislature. Harry A. Mackey, Philadelphia, chairman of the board for some years, resigned last January. Governor Pinchot this week named Commissinoer Houck and John L. Morrison, an editor of Greenville, as members of the board, their terms to run to the close of the next session of the Senate.

TENNESSEE

Resolutions calling upon officials of District No. 19 United Mine Workers to petition the International executive board of the union **to take necessary steps for the calling of a strike in all the non-union mines** of that district, were adopted June 1 at a meeting of union delegates in a conference held at Middlesboro.

TEXAS

The Standard Coal Co., of San Antonio, has filed an amendment to its charter decreasing the capital stock from $500,000 to $300,000.

The O. K. Lignite Co., of Garrison, has been organized to mine and market Texas lignite. The company owns considerable lignite lands near Garrison, in central Texas, and will develop this property. The company is capitalized at $60,000, and the incorporators are C. W. Osborne, Dr. R. B. Little and D. H. Roherer.

The Anderson County Coal Co., of Palestine, **has sold its holdings of Texas lignite land** in Anderson County **to the Ligol Chemical Co.**, of Houston. J. W. Crotty, of Houston, president of the chemical company, says his company will establish a large chemical plant in Anderson County and will extract chemicals from the output of the mines to be opened on the land his company has purchased.

WEST VIRGINIA

The Pond Creek Pocahontas Coal Co., in which those formerly owning the Pond Creek Coal Co., acquired by Henry Ford and his associates, are interested, has begun the active work of **developing about 3,000**

acres of coal land in McDowell County. The contract for sinking two shafts for the company has been awarded to Major Don H. Blanks, formerly of Fairmont, but now connected with a large contracting firm in Greensburg, Pa.

Organization of the **Crab Orchard Smokeless Coal Co.** presages development of additional coal territory in the Winding Gulf region on quite an extensive scale, since this company has an authorized capital stock of $200,000. Beckley, in the heart of the Gulf field, will be the headquarters for the new company, in which the following people are largely interested: L. C. Lilly, W. M. Hackworth, W. W. Hume, Ashton File, all of Beckley, and P. B. Rodgers, of Crab Orchard.

With the purchase of all the outstanding stock of the **Morgantown Coal Co.**, ranking as one of the oldest wholesale coal concerns in Morgantown, by M. L. Taylor and R. Hugh Jarvis, the company **has been reorganized** and will immediately re-enter the active competitive field, having ceased operations more than a year ago. In the reorganization Mr. Taylor has been elected president, Hugh Jarvis vice-president, and Harry C. Owens, secretary. Not only does the company plan to re-enter the whole coal trade, but it also proposes to operate mines.

In severing his connection with the Pond Creek Coal Company, which was recently bought by the Fordson Coal Co., **H. M. Ernst**, who has been for a number of years assistant general manager of the company, **has become identified with the Island Creek Pocahontas Coal Co.**, of which T. B. Davis, of New York, is president. Other officers in the company are J. D. Francis, of Huntington, vice-president; A. R. Beisel, of Logan, general manager. The Pond Creek Coal Co. formerly was owned by Mr. Davis and his associates, who operate the Island Creek Coal Co. in the Logan field. Mr. Ernst will have charge of the development of about 3,000 acres of coal land in McDowell County, near Coalwood. A contract has already been awarded for the sinking of two shafts.

An office has been opened by the Peoria Coal Co. in the Deveny Building at Fairmont, Charles McKivett having been appointed as local manager. Thomas Love and others are interested in the Peoria company.

The National Gas Coal Co., of Pittsburgh, Pa., has been authorized **to surrender its charter** and discontinue its corporate existence in West Virginia. **The Deep Hollow Coal Co.**, of Coalburg, has been authorized **to decrease its caiptal stock** from $50,000 to $10,000.

There has been organized under the laws of West Virginia **the Pawva Coal Co.**, which as its name implies will engage in the coal business in Pennsylvania and West Virginia. Headquarters of the new enterprise are at 712 First National Bank building, Pittsburgh, Pa. The company is capitalized at 1,000 shares without par value. Active in organizing this company were: Samuel A. Taylor, J. M. Taylor, George Paull, of Pittsburgh, Pa.; Charles F. Taylor and Denny I. Campfield, of Clarksburg.

Safety meetings were held at the southern West Virginia, Virginia and Kentucky **operations of the Consolidation Coal Co.** during the latter part of May. In all more than a thousand miners attended the meetings, which were held at Coalwood, Six and Coretta, W. Va.; at Alfredton and Coaldam, Va., and at Anchor and Warren, Ky. Joseph W. Reed, director, and Robert J. Lauder, assistant director of the safety department of the company conducted the meetings. Among the speakers were: R. M. Lambie, chief of the West Virginia Department of Mines; Franklin K. Day, general manager of the Pocahontas-New River Division of the company; R. F. Cole, assistant general superintendent, and Mr. Brandt, general outside foreman, all of Coalwood.

Men prominent in operating circles in Winding Gulf territory have organized a coal-mining supply company with a view to engaging in business on a large scale. The new company is capitalized at $300,000. The principal office will be at Beckley, in the heart of the Winding Gulf field. Among those identified with the new concern are: Ernest Chilson, an official of the Raleigh Coal & Coke Co., of Raleigh; Thomas H. Wickham, Winding Gulf operator; Joseph A. Groft, Daniel Boone and Ashton File, of Beckley. The new concern will be known as the Daniel Boone Mining Machine Co.

UTAH

The Utah Fuel Co. has been allowed $299,755 with interest for nearly five years by the I. C. C. in connection with its claim of excessive **charges against the railroads during the Federal administration.** The overcharges cover a period from June 25 to Nov. 19, 1918, and involved 7,123 cars of slack switched at the company's property at Sunnyside. It was ruled that a charge of $2.50 per car would have been reasonable, whereas $6.69 was actually made.

WISCONSIN

The Consolidation Coal Co., which has heretofore carried on its operations in the Milwaukee field through the Milwaukee-Western Fuel Co., **has opened an office at 843 South Canal St., Milwaukee.**

WASHINGTON, D. C.

The Midland Coal Co. lost its claim for $20,395 by the termination of a government contract on which it was to furnish coal to Camp Funston three years ago. The company claimed this amount on 20,000 tons of coal which the government did not take as the camp was abandoned and the Controller General of the Treasury Department ruled that the government had a right to cancel the contract and disallowed the claim.

CANADA

Drilling operations in the Chelmsford Basin, a short distance northwest of Sudbury, Ont., have **revealed the presence of a seam of coal about 6 ft. thick** at a depth of 342 ft. Investigations of the coal deposits in this region are being carried on by the British & Colonial Coal Mines, Limited.

J. W. MacMahon has been appointed Canadian representative for the Bertha-Consumers Co. of Pittsburgh, with headquarters at 614 Grosvenor Avenue, Westmount, Montreal, Quebec. Mr. MacMahon was formerly assistant purchasing agent for the Canadian Explosives Co. of Montreal.

The Dominion Coal Co. has completed its new shaft at O'Neil's Point, near Bridgeport, C. B. It will be known as Dominion No. 1, and is 670 feet deep. The work of sinking the shaft was begun last November. It has a concrete rim of 30 to 40 ft. down to sea level and the timbering, which is of hard pine, was done in 36-ft. sections.

Coal operators of the Province of Alberta, and others interested in the business in western Canada, **will hold a conference in Winnipeg this month** to discuss the matter of the shipment of domestic coal from Alberta to Ontario. The governments of each of the prairie provinces will be represented and the chief dealers of Ontario will attend. Sir Henry Thornton, president of the C. N. R., is expected to be present.

Net profits of the Crow's Nest Pass Coal Co. for 1922 were $213,959, as compared with $341,938 for the previous year. Add to this the actual balance brought forward from the previous year of $84,857, and, allowing for taxes, the sum left for appropriations was $192,957. The company paid $372,690 in dividends, leaving a debit balance of $94,874 to be carried forward and be provided for in 1923. The decrease in profits is attributed to the five months' strike at the mines. The company's current assets were $1,190,000 and current liabilities, $395,768.

Recently a number of miners have come from Scotland and have obtained employment in the Scotia pits and the Glace Bay coal fields. The arrival of the miners, it is thought, will to some extent offset the emigration of Nova Scotia miners to the United States. There also are many Italians filtering into Cape Breton and seeking work in the mines of the British Empire Steel Corporation.

Sabotage at the coal mines in the Grand Lake districts is alleged in connection with fires that destroyed a shaft house at one of the mines and also two C. P. R. freight cars standing on the tracks. According to reports the trouble started at the Avon Coal Co.'s mines following the dismissal of two miners, and it was said that the difficulties are the reason for the visit there of E. McG. Quirk, of the federal department of Labor, Ottawa, who has been called in to make an investigation of conditions.

Thomas Graham, general superintendent of the Canadian Collieries (D), Ltd., **was elected president of the British Columbia division of the Canadian Institute of Mining and Metallurgy** at the annual meeting held May 14 at Vancouver. He is succeeding F. W. Guernsey, who asked to be relieved of office and who was tendered a dinner. H. Mortimer Lamb, the secretary, in submitting his report suggested the establishment of a branch of the Institute at Stewart, Portland Canal. Amendments to the Professional Engineers' Act of British Columbia have been considered, but it was not thought well to touch that act at present. The standardization of examinations for coal-mine managers' certificates throughout the Dominion of Canada was a proposal upon which the parent body will be asked to act.

Association Activities

Officers elected by the Southwest Interstate Coal Operators' Association at the annual meeting in Kansas City, June 12, are as follows: Charles F. Spencer, Midway Coal Co., Pittsburg, Kan., president; George J. L. Wulff, Western Coal & Mining Co., St. Louis, Mo., vice-president at large; C. N. Fish, Home Riverside Coal Co., Leavenworth, Kan., secretary; George Manuel, Kansas City, Mo., assistant secretary; John M. Young, Greenwood Coal Co., Pittsburg, Kan., vice-president for Kansas; Isadore Pickering, Pickering Coal Co., Richmond, Mo., vice-president for Missouri; M. M. McWilliams, Clark-McWilliams Coal Co., Clarksville, Ark., vice-president for Arkansas; J. R. Crowe, Crowe Coal Co., Henryetta, Okla., vice-president for Oklahoma; W. L. A. Johnson, Kansas City, Mo., general commissioner; George Richardson, Pittsburg, Kan., commissioner, and Bernard Harrigan, Pittsburg, Kan., assistant commissioner of District 14; P. R. Stewart, Fort Smith, Ark., commissioner, and Joe Johnson, Henryetta, Okla., assistant commissioner of district 21 directors for Kansas, John A. Sargent, Central Coal & Coke Co., Kansas City, Mo.; Joseph Fletcher, Jackson Walker Coal & Mining Co., Pittsburg; W. C. Shank, Crowe Coal Co., Pittsburg, and Ira Clemens, Clemens Coal Co., Pittsburg; directors for Missouri, F. R. Atwill, Mercantile Coal Co., Richmond; C. J. Baxter, Big Creek Coal Co., Kirksville; E. J. McGrew, McGrew Coal Co., Lexington; directors for Oklahoma, J. R. Crowe, Henryetta; J. C. Reid, Cameron Coal Co., Williams; R. E. Lee, Rock Island Coal & Mining Co., Chicago; directors for Arkansas, M. M. McWilliams, Clarksville; R. A. Young, Greenwood, and J. G. Puterbaugh, McAlester Fuel Co., McAlester.

The Texas Retail Coal Dealers' Association at its annual convention held at Galveston on June 11 and 12 adopted resolutions advocating graduated seasonal-regional coal freight rates; to impress upon the public, individuals and corporations, the advisability of purchasing coal in the summer; to obtain the assistance of the U. S. Bureau of Domestic and Foreign Relations in a publicity campaign setting forth figures in relation to purchasing coal in the summer; to obtain repairs on cars before loading with coal; to obtain revocation of the order for loading to 10 per cent above marked capacity, issued by railroads and obeyed by mines; for strict observance by mines of the rule governing size of coals; for better preparation and prevention of slack being loaded with domestic or fancy sizes and for weighing of coal at point of destination or point nearest in line of transit. The association also went on record in favor of the buying of coal based on the price in effect at date of shipment, instead of date of purchase. The fulfillment of all contracts upon price at time which orders are accepted also was advocated. Elijah Cole, of Houston, was elected president; Harvey S. Trewitt, Dallas, first vice-president; William N. Martin, Vernon, second vice-president, and Clarence R. Goldmann, Dallas, was re-elected secretary. The executive committee is composed of the following: Charles Fowler, Galveston, chairman; Lee M. Pool, Greenville; Tillman Bibb, Fort Worth; L. M. Bushnell, Waco, and the officers of the association.

Obituary

Francis Lockhart, 48 years old, formerly of Pittsburgh and Somerset, Pa., died June 17, in Fellsmere, Fla. Mr. Lockhart was formerly secretary of the Somerset County Coal Operators' Association, Somerset, Pa. He leaves his widow, Mrs. Ethel B. Lockhart of Pittsburgh; one sister, Mrs. George T. McCarty, and one brother, Floyd Lockhart.

Trade Literature

Sanation of Impaired Structures and Subterranean Waterproofing by Weber Intrusion Methods. Weber Engineering Corp., Singer Building, New York City. Pp. 8; 4 x 9 in. Especially applicable in safeguarding the excavation while driving mine shafts and in protecting the shaft from the contamination of the sulphur, alkalies and other impurities in the ground water.

Wood Pipe. Continental Pipe Mfg. Co., Seattle, Wash. Catalog No. 18. Pp. 248; 6 x 9 in.; illustrated. This well-arranged and profusely illustrated book describes Continental wire-wound wood pipe, continuous stave wood pipe and creowood flume.

Uniflow Improved Return Tubular Boilers. Lebanon Boiler Works, Philadelphia, Pa. Bulletin 23-A. Pp. 23 ; 3 x 6 in. ; illustrated. This little book describes the advantages and savings of the "Uniflow" boilers.

American Airtight Door. The Conveyors' Corporation of America, Chicago, Ill. Folder describing an airtight door, largely used in ash pits and boiler settings, made in five sizes: 15x16, 18x18, 22x26, 24x24 and 24x36 in. The door is strong and substantially built of cast iron. When closed and locked it is airtight.

Publications Received

"Strikes and Lockouts, 1922," is the title of an article in the June number of the *Labor Review*, giving statistics as to the number of strikes in each of the years from 1916 to 1922 inclusive for the country as a whole and by states, the principal causes of the strikes, the number of persons involved, the duration of such strikes and other interesting data. A tabulation is given as to the number of disputes in certain specified occupations for the years mentioned. It shows that in the occupation of coal mining there were 373 disputes in 1916; in 1917, 355; in 1918, 162; in 1919, 148; in 1920, 161; in 1921, 81, and in 1922, 440. While the number of strikes reported for 1922 was less than that for any of the six years preceding, the number of strikers exceeded those in each of the other years with but one exception, because of the coal and rail strikes of last year. The coal strikes involved about 600,000 men and the rail strike about 400,000 men.

The Department of the Interior announces the issuance of Technical Paper 333, **"Permissible Explosive, Mining Equipment and Apparatus Approved Prior to Jan. 1, 1923,"** by the Bureau of Mines. It contains a table giving the brand names of all explosives now considered as permissible for use in dusty and gaseous coal mines, tested by the Bureau of Mines prior to Jan. 1, 1923. The list includes a total of 154 permissible explosives. In addition to permissible explosives, Technical Paper 133 includes lists of permissible explosion-proof coal drilling and short-wall mining equipment, permissible electric lamps, permissible flame safety lamps, permissible methane indicators, single-shot blasting units, storage-battery locomotives, mine-rescue breathing apparatus, and gas masks. Technical Paper 333 may be obtained from the Department of the Interior, Bureau of Mines, Washington, D. C.

Traffic News

Questions involved in the case of the **Colorado & New Mexico Coal Operators' Association versus the Denver & Rio Grande** will be discussed at an Interstate Commerce Commission hearing in Denver on Sept. 10. Commissioner Hall will attend the hearing.

Only twice within the history of the Chesapeake & Ohio R.R. have the monthly coal loadings on that road been as large as they were **during the month of May, 1923, when over 3,000,000 tons was handled by the road.**

The Chesapeake & Ohio Railway Co. has been authorized by the Interstate Commerce Commission **to assume liability for $371,000 worth of Elkhorn Piney Coal Mining Co. car trust certificates.**

The New York Central R.R. has been authorized by the Interstate Commerce Commission to issue equipment trust certificates in the amount of $17,340,000 to be dated June 1, 1923, proceeds of which will be used in the purchase of additional new equipment.

Combination rates on bituminous coal over the Baltimore & Ohio and Pennsylvania from mines on the Baltimore & Ohio in West Virginia to Trenton, N. J., have been found not to be unreasonable. The Interstate Commerce Commission has denied a plea for the establishment of joint rates on such movement.

Revised freight rates on shipments within Colorado went into effect June 19, over the protests of the railroad companies. The changes are many, **providing reductions of from 10 to 25 per cent.** These are rate changes ordered by the Colorado Public Utilities Comission and have no relation to the sweeping changes in coal rates between Rocky Mountain states and the West and Northwest, issued at Washington by the I.C.C. June 22 to become effective in ninety days.

A new railroad being constructed by the Haskell interests from Caspar, Wyo., to Miles City, Mont., will make accessible extensive coal deposits. This line of railroad, while only 330 miles in length, is of unusual significance, since it furnishes a connection between the Union Pacific, the Northwestern, the Chicago, Burlington & Quincy, the Northern Pacific and the Chicago, Milwaukee & St. Paul. No such similar tie exists, except 600 miles away toward the east.

The New York, Ontario & Western R.R., according to its annual report, **in 1922 carried over its lines coal valued at $3,652,-149.15,** as compared with $5,498,964.11 in 1921. It holds $2,400,000 worth of first mortgage bonds of the Elk Hill Coal & Iron Co. and $1,153,000 first mortgage bonds of the Scranton Coal Co. John B. Kerr, president, says in his report that the net loss in gross earnings from coal transportation due to the strike was over $1,800,000 as compared with the preceding year, while the net loss in gross and net earnings by rate reductions on traffic was over $300,000. Coal consumed during the year was 16,926 tons of anthracite and 278,040 tons of bituminous, compared with 38,900 tons of anthracite and 250,843 tons of bituminous in 1921. The cost of fuel per engine mile was 40.93c. in 1922 as compared with 36.96c. in 1921.

A total of 9,876 new freight cars were placed in service by railroads between May 15 and June 1, according to the Car Service Division of the American Railway Association. This brought the total number of new freight cars installed in service from Jan. 1, 1923, to June 1, to 65,660. Of the new cars placed in service during the first five months this year, 26,806 were coal cars. The railroads on June 1 also had on order 107,079 new freight cars, deliveries of which are being made daily. A total of 161 new locomotives also were placed in service from May 15 to June 1, which brought the total installed from Jan. 1, 1923, to June 1, to 1,697. The railroads also had 2,041 new locomotives on order June 1.

Rates on fine coal from producing points in Illinois, Indiana and western Kentucky to Sioux Falls, S. D., have been found by the Interstate Commerce Commission to be unduly prejudicial to Sioux Falls and unduly preferential to Sioux City. The rates on fine coal, the cmomission finds, should not exceed the contemporaneous rates to Sioux City by a greater percentage than the rates on lump coal to Sioux Falls exceed rates on lump coal to Sioux City from the same points of origin. Commissioner McChord dissented from the opinion of the majority on the ground that the lower value of fine coal and the lower terminal expenses incident to the movement to Sioux Falls do not justify the conclusions reached by the majority.

The Northern States Power Co., a large consumer of coal in the Northwest, intervening in the Northwestern Coal Dock Operators' Association case, **urges that nothing be done to break up fair competition among those who sell coal in the Northwest.** The power company advises the Interstate Commerce Commission that the inability of the Northwestern docks to move a full tonnage of coal during recent years has been due almost entirely to abnormal conditions rather than to any freight-rate discrimination. The present freight rate adjustment is fairly equitable in providing a basis for active competition, the power company declares. During the year just ended, it says, the docks, with a limited tonnage of high-price coal, were not in a position to compete with southern Illinois upon any reasonable freight-rate adjustment. The power company urges that no ket by the dock operators under normal conrate advances be recommended until operations under normal conditions over a representative period be tried out. To have a rate adjustment which would have enabled the docks to compete during abnormal times would mean the entire control of the market. The power company is careful to point out that the Lake Superior docks constitute a valuable reservoir for the storage of a large summer movement of coal and that they are a great protection and convenience, but that sight must not be lost of the value of southern Illinois in maintaining competitive conditions.

Freight-car performance statistics for April, compiled by the Bureau of Railway Economics, show that the average daily movement per freight car during that month was **the greatest for any month since the autumn of 1920** when freight traffic was especially heavy. The daily average for the month was 28 miles, an increase of one mile over that for March, 6 7/10 miles over the average for April last year and 7 4/10 miles over the average for the same month in 1921. Compilations show that the average load per car in April was 27.6 tons. This was three-tenths of a ton less than the average for March, but an increase of 3 1/5 tons over the average for April last year. Except for April, 1918, when the average was 29.8 tons, and April, 1920, when it was 28.6 tons, the average for April this year was the heaviest for any April since tabulations of these records began in 1917.

Coming Meetings

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the **International Safety and First-Aid Meet.** Secretary, Benedict Shubart, Denver, Colo.

Iron and Steel Exposition at Buffalo, N. Y., Sept. 24-28. Association of Iron and Steel Electrical Engineers, Empire Building, Pittsburgh, Pa.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

International First-Aid and Mine Rescue meet will be held Aug. 27-29, at Salt Lake City, Utah.

The American Institute of Mining and Metallurgical Engineers has accepted the invitation extended by the Ministers of Mines of Ontario and Quebec and by the Canadian Institute of Mining and Metallurgy to hold its autumn meeting in Canada. The meeting lill start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

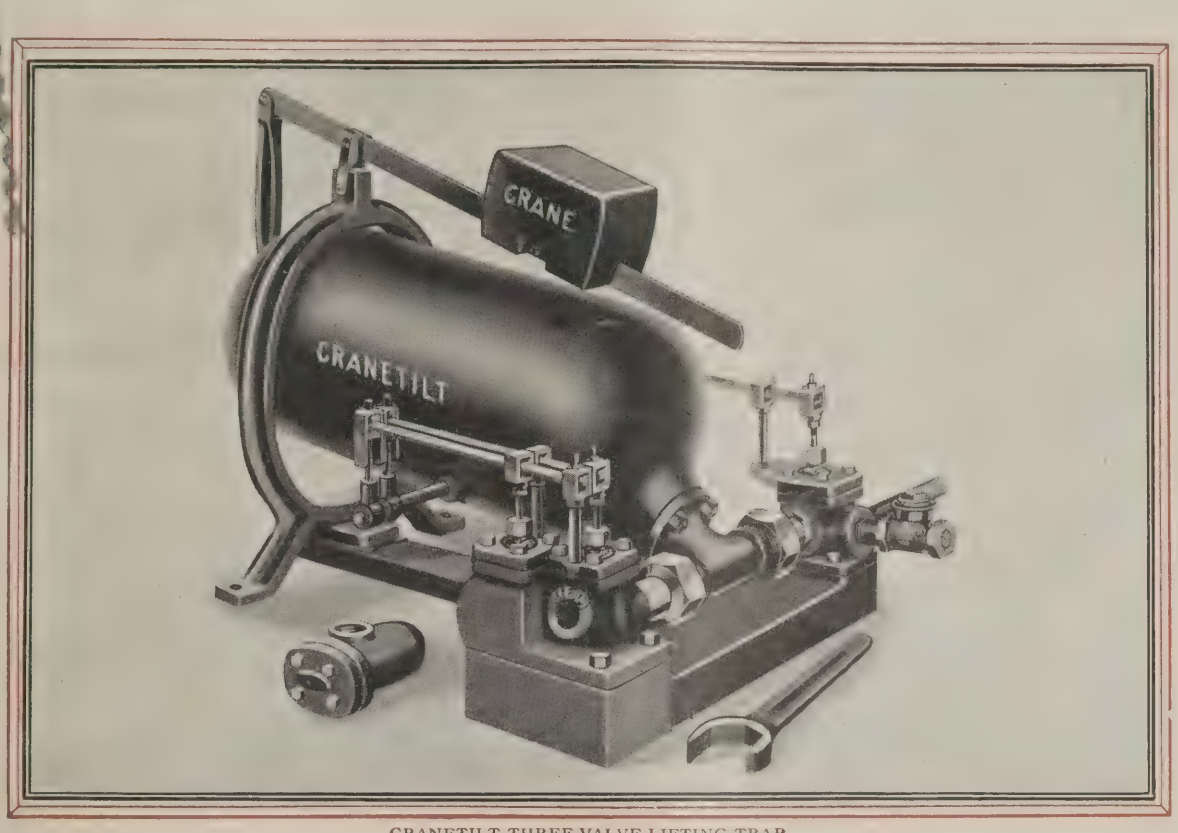
Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment,** Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Ninth National Exposition of Chemical Industries at the Grand Central Palace, New York City, week of Sept. 17. Manager, Charles F. Roth, Grand Central Palace, New York City.

Mine Inspectors' Institute of America will hold its 13th annual meeting July 10-12 at Pittsburgh, Kan. Secretary, J. W. Paul, 4800 Forbes St., Pittsburgh, Pa.

Ontario Mining Association will hold its annual meeting July 5 at Kirkland Lake, Ont., Can. Secretary, B. Neilly, Toronto, Ont., Can.



New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

CRANETILT THREE-VALVE LIFTING TRAP

CAPACITY THE REAL TEST FOR STEAM TRAPS

In Cranetilt steam traps, the discharge valves are larger than the piping connections, insuring the highest possible capacity. By actual tests, Cranetilt traps have proved themselves able to handle as much as ten times the amount of water which can be put through a bucket or float-trap of the same rated size. Even where close examination would not reveal sacrifice of quality—in valves, fittings and sanitation fixtures—Crane standards are maintained to provide maximum efficiency and long life in each unit.

You Can Store 600 Tons per Hour with the BEAUMONT CABLE DRAG SCRAPER

—at a labor cost of less than one cent a ton

The simplest coal storage system. No tracks or trestles needed.

USERS of the Beaumont Cable Drag Scraper system for storing and reclaiming coal uniformly report labor costs of less than one cent per ton handled.

Coal mines, public utilities and industrial plants all over the coal-consuming part of the country have found this system the most economical and efficient for storing large quantities of coal.

It has an especial value to mines, insuring steady operation and eliminating losses caused by car shortage.

Handles lump or crushed coal at any rate up to 600 tons per hour. Storage area can be any size or shape, with unlimited capacity; level ground unnecessary. No danger of spontaneous combustion.

Write or wire for engineer to discuss details, or ask for Catalog 45. No obligation.

It Seems Quite Likely

that a few years from now we shall not be using any raw coal under boilers, but every large mine operation will have its own coal-distilling plant and will sell coke, gas and byproducts instead of coal, or perhaps will generate electric power at the mines with the surplus gas. Consequently what is being done at the coke and byproduct plant of the Cambria Steel Co. will be interesting to all our readers, and next week *Coal Age* will publish a story on the subject as written by G. A. Richardson.

Extinction of a Mine Fire

Shallow mine fires last for months and years. They often get entirely beyond restraint. The danger of a shallow mine fire is in its partly going out. It cools down and draws in air, and the air sets it going again. But if the draught were only incombustible gas, the product of an earlier combustion, the fire would not revive. This was proved at a big fire in a coke-region mine. One wonders, if it had been tried earlier, whether it might not have saved Carbondale from its continuous pall of smoke and the Lehigh Coal & Navigation Co. from a million dollars of expenditure at the Summit Hill fire. Instead of a great excavation costing an immense sum of money a giant "soda" might serve to extinguish the Red Ash fire.

Dynamic Braking

Mr. Gealy in next week's issue will have an article on electric braking and its place in the operation of mine transportation, especially where a locomotive makes many stops.

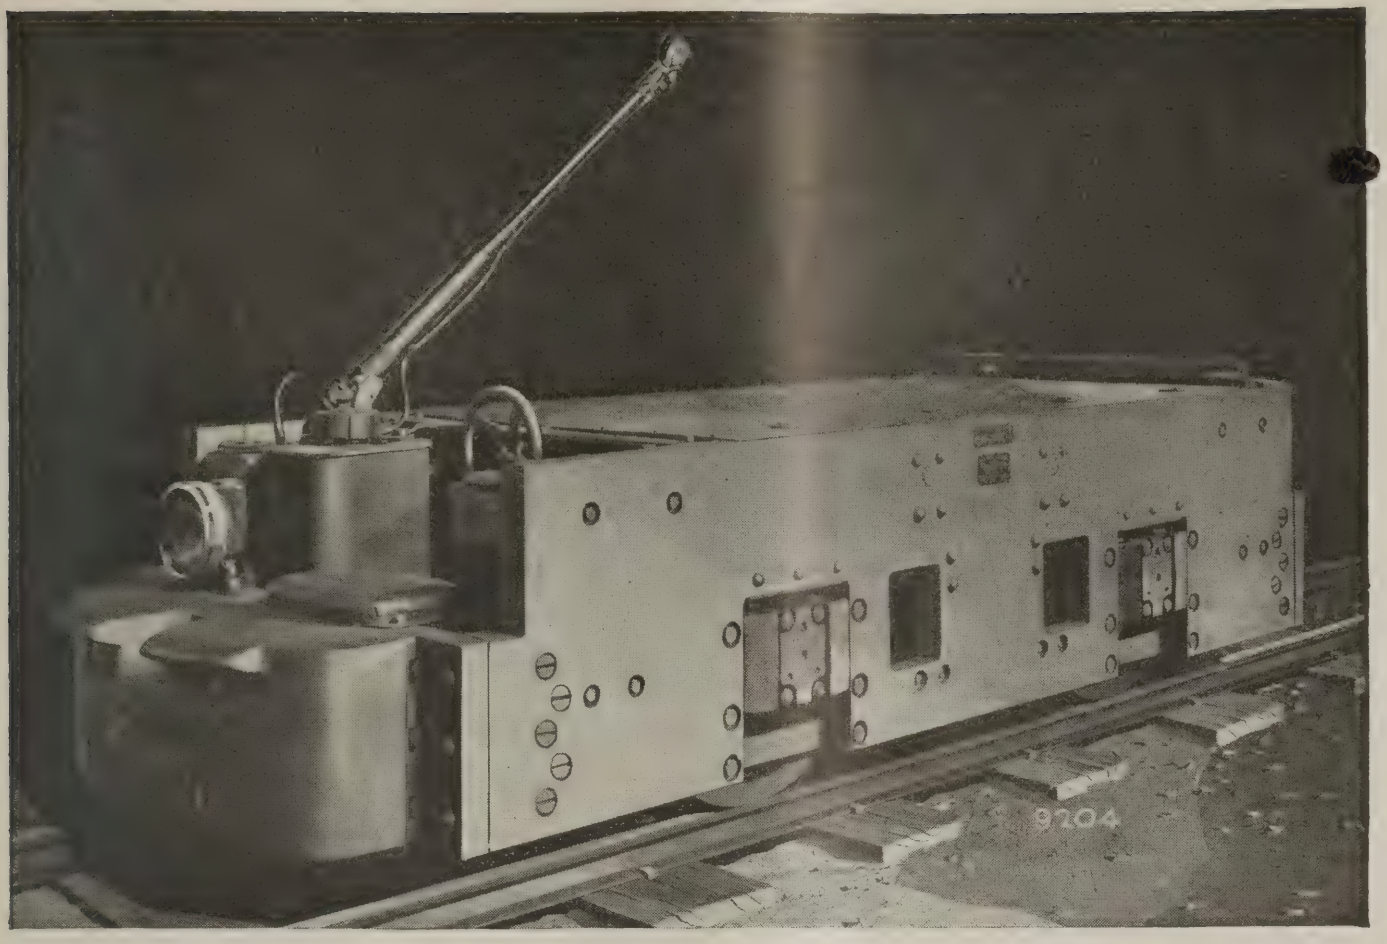
Type K-3 Hanger with threaded boss to give minimum roof clearance. Insulated with Dirigo, the moisture and time proof insulation.

Universal-1 Hanger. Has a broad roof bearing surface desirable in curve work. Multiple petticoats in insulation prevent surface leakage.

The Saw Test will always be the same with O-B Hangers

There is a uniformity in material and a refinement in manufacturing process that are revealed in a saw cut section of an O-B Hanger. Saw any O-B Hanger in two and you will see for yourself.

Repetition of manufacturing process, day after day, using materials under constant technical supervision, puts a uniformity into the hanger that shows itself in any sample. Try one today or any time and the result is the same.



It is this O-B characteristic that keeps O-B Hangers put up 20 years ago still on the line, and will keep those put up today or tomorrow on the job for years to come.

Those who are using O-B Hangers have reason for their faith

No Weak Spots In a Jeffrey Locomotive

Jeffrey Mine Locomotives are built for economical operation even under the toughest kind of service. Men who have devoted many years to the study of mine haulage problems from every angle design these machines. The result is a line of locomotives ranging from 4 to 30 ton capacities adapted to hard work. The power and ease of operation enables Jeffrey Locomotives to handle trips rapidly, as demonstrated in hundreds of anthracite and bituminous properties.

The Low Ash Coal Co., Excelsior, Bell County, Kentucky. Chas. Janeway, Mine Foreman says:—"Our Jeffrey Locomotive has been in service for fifteen years. The gears and pinions, wiring, field and armature are in good shape. We are well pleased with the work of our Jeffrey Locomotive and are dependent on it for our production. It has never failed us."

Jeffrey Labor-Aiding Mining and Tipple Equipment includes:

Coal Cutters; Drills; Pit Car Loaders; Electric Trolley and Storage Battery Locomotives; Ventilation Fans; Coal Crushers and Pulverizers; Elevators; Conveyers; Combination Picking Tables and Adjustable Loading Booms, Screens, Car Hauls, etc.

JEFFREY
MINING EQUIPMENT

Here's dramatic evidence of the value of "GUNITE" for Fireproofing Timbering

What Happened to a Pile of Creosoted Timber

Story of an Eye Witness—Pile of Creosoted Mine Timber Fired by Spark from Locomotive—Water Failed to Extinguish Fire

. . . I was running a mine hoist, at one of the large shaft mines here in Nanticoke. The company had a creosoting plant at one of their other mines and had sent over two flat cars loaded with mine timber that had been treated with creosote. . . .

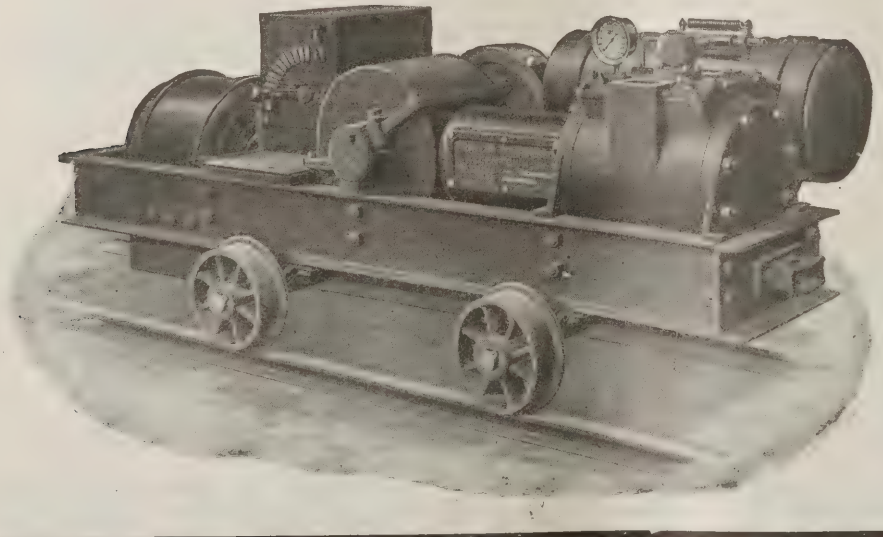
When I came out in the evening, ready for the night-shift, I observed the small locomotive coming up the track. Just then a signal for lowering men called me to the throttle. . . .

Returning to the doorway, a few minutes later, what was my surprise to behold a volume of smoke coming from the pile of timber. Evidently, the fire had caught from a spark or hot coal falling from the engine. Without seeing it, one would hardly believe the volume of dense smoke that was given off from the burning pile. It resembled the discharge from two big locomotives pulling a heavy trip of cars up a mountain grade.

The alarm was quickly given, but water appeared to have no effect to extinguish the fire. . . .

The following morning, the mine superintendent was early on hand to view the place. I remarked to him that had the timber been ignited in the mine, not a man or animal inside of the burning section would have been able to escape through the dense volumes of smoke produced by the burning timber. He agreed with me and put himself on record then and there against the use of creosoted timber in the mine.

In closing, allow me to suggest that the use of the "Cement-Gun" and the coating of mine timbers with "Gunite" is of far greater practical value as a preservative of timber and is not a menace to the safety of the mine. I hope this brief account may be of some value in averting disaster.



Nanticoke, Pa. W. A. BARRETT.

See Coal Age, May 24, Page 862 for entire letter

Read the story—it carries its own moral! Now let us tell you more about the use of "GUNITE," applied by the "Cement-Gun"

And ask us about this Compressor.

This one is the Traylor motor-driven MINE TYPE. No kicks or quakes. Runs so free from vibration it needs no blocking on the rails. For any pneumatic work. Straight line. Slow speed. Worm gears. Two sizes—9 x 8 and 13 x 8. Bulletin 104.

"The Waugh Way Wins"

A A

WHEN Dun or Bradstreet report "AA" on a man's financial strength, you have no hesitancy about dealing with him.

Likewise, before doing business with a scraper hoist, you wisely investigate *its* mechanical rating.

The new Model 300 Turbro Waughoist is in the "AA" Class. Here are the figures:

Air pressure recommended at hoist, 50 lbs.
Average horsepower developed at 50-lbs. pressure, 10 hp.
Maximum horsepower developed at 50-lbs. pressure, 13.5 hp.
Rope speed, 1600-lb. rope-pull—50-lbs. pressure, 295 ft. per min.
Rope speed, 1800-lb. rope-pull—50-lbs. pressure, 235 ft. per min.
Rope speed, 2000-lb. rope-pull—50-lbs. pressure, 178 ft. per min.
Rope speed, 2200-lb. rope-pull—50-lbs. pressure, 118 ft. per min.

Before buying a hoist for scraping, lifting, or pulling, compare the ratings. We'll be glad to send you our new 300 bulletin. Ask the nearest Waugh branch office for a copy today.

Tom Langan

12,000,000 tons of material hoisted

cage travel— 13½ times around the globe

No. 1. Thomas Langan, Hoisting Engineer, Seneca Colliery. No. 2. The breaker tower just before operations were stopped. No. 3. How the tower was razed by dynamiting its foundations. No. 4. Dust arising from fallen tower.

and his Veteran Vulcan— Team-mates for 33 years!

June 18th, 1888, when the old Seneca Breaker of the Lehigh Valley Coal Company first started to operate, Tom Langan, Hoist Engineer, was put in charge of a steam-operated Vulcan.

Tom and his Vulcan stayed on the job, continuously for 33 years—up until the old breaker was razed.

Still good for more service

The fact that the original Vulcan Hoist, with practically all parts intact as installed, were still good for more service when the breaker was shut down, speaks well for both the equipment and the efficient care of the operator.

The original crank pin, wrist pin and crosshead shoe brasses were still in use when operations stopped. The cylinders were never rebored and were in fine condition after 33 years' continuous service.

Cage travel—13½ times around the Globe

The tonnage handled by this Vulcan during its 33-year service was approximately 8,500,000 tons of coal; and about 12,000,000 tons of total material, including boiler fuel and refuse—or 6,000,000 hoists. Figuring 225 feet of travel of the cage per hoist, the cages traveled 340,000 miles—about 13½ times around the earth.

Thus the story of Vulcan equipment made over 33 years ago.

We've been bettering our Hoists ever since

Ever since this Veteran Vulcan Hoist was installed, we have been bettering the material and design of both our steam and electric Hoisting Equipment. From the standpoint of durability, ease and speed of operation—and safety — the modern Vulcan is — needless to say—unsurpassed.

Small wonder that the demand for Vulcan Hoisting Equipment has been steadily increasing in mines throughout the country.

Get in touch with us

A complete description of Vulcan Hoists or other equipment, with a list of enthusiastic users, will be sent you by return mail.

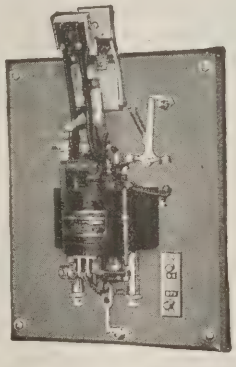
VULCAN OF WILKES-BARRE HOISTS

The Shriek of Araby

Out of the warm dark portal of the mine and into the blinding sunlight emerged Foreman Hodges, blinking his eyes while knocking the carbide from his lamp with one hand and shaking his cap with the other to dislodge a piece of fungus gathered from the wet timbers just inside.

He hailed the Superintendent beneath the tipple where the last car of the day was being topped preparatory to being sent down the siding to compose a part of the "out" train in the morning.



"I ran into the machine runners going on this A.M.," he began, "and they sure climbed my hide for a fare-you-well.

"That cutter, Tony Araby, knows too much for the rest of them. Got 'em all steamed up to perfection. The boys were mad, that's all."

"How was that Hodges", the Boss queried.

"Well, you know those fellows are on a yardage basis and get to work just as soon in the evening as they can. Try to get all their places cut and then 'partie' for home 'toot sweet.' We don't keep anyone in the substation at night and when the breaker pops they take turns walking outside and putting it back in.

"Appears like last night was a mean one on all hands. So much time was lost that they didn't get out until time for the loaders to come out this morning, and then none had all his rooms cut.

The Circuit Breaker with Brains

"Tony is wise, though—older and been around a bit more—and knows how the trouble can be corrected. He tells the others and the whole gang sand-bags me this morning.

"Araby led the cheers and shrieks though, for the rest of the bunch and they practically issued an ultimatum that if something wasn't done shortly, they were going where they could get their work done and make some faster jack.

"Really a bad situation, 'Chief,' " the foreman continued.

"Araby is the best cutter on the job and I'd hate to see him leave. He isn't asking for anything unreasonable, either. What is his profit is ours also, and that doesn't include a muchly needed better voltage at the machines.

"Says we ought to have automatic reclosing circuit breakers inside so that when one of them threw an overload or 'short' on the line it wouldn't effect the rest, too."

"Hodges," cut in the Super, "sorry to interrupt your account, but you tell Tony and his crowd that I had a representative of the Automatic Reclosing Circuit Breaker Co. here today going over our layout, and I've placed an order for eight of them.

"The only mistake we made was in not listening to the shrieks of Araby months ago. Tony's all right."

Cut Your Coal With

Alternating Current Ironclads

One of 48 Sullivan A.C. "Ironclads" owned by Nokomis Coal Co., Illinois.

Below, Sullivan Longwall Ironclad, A.C. type, La Salle County Carbon Coal Co., La Salle, Ill.

Are You Opening a Mine?

Don't wait for a power plant—

Hook a transformer to the nearest transmission line, wire your entries as they advance and start production at once with one or two Sullivan "A.C." Ironclad Mining Machines. They are fast and handy for entries and narrow work.

When your direct current plant is in, save it for haulage and keep on cutting coal with A.C. Ironclads. This method will obviate low voltage at the machines, which often results when the same feed wires are used to supply cutters and locomotives.

Where difficult cutting is encountered, A.C. Ironclads will get out the tonnage when other types stall and stop working. A.C. Ironclads are built for room and pillar and for longwall mining. They will cut in either direction, can be equipped with cutter bars up to 10 feet (for room mining), and possess all other mechanical advantages of the direct-current Ironclads.

Edison Safety Lamps

Greater Average Illumination
More Even Distribution of Light

More than 200,000 Edison Electric Safety Mine Lamps in more than 1,000 mines are proving that they are

Safe—Powerful—Dependable—Economical

A miner wearing an Edison Safety Mine Lamp can get more work done—he does not have to stop every few hours to fix his lamp.

The sturdy construction of the Edison Battery—All-Steel with steel-preserving Alkaline solution—explains why the Edison Mine Lamp has ruggedness, long life and dependability.

Bulletin 300 will tell you how Edison Mine Lamps will handle safely and successfully your mine lighting problem. Your copy on request.

Standardized

It takes years of experience to enable a manufacturer to standardize his equipment—and particularly the electrical equipment employed under the varying requirements of mine hoist service.

This Westinghouse has been able to do, so that today—as a result of many years' experience in design and application—you are enabled to take advantage of the benefits of standardization in Westinghouse mine hoist equipment.

The qualities chiefly sought for by Westinghouse engineers in this standardization have been, first, reliability, and second, economy of operation.

This is attested to by the hundreds of successful Westinghouse installations throughout the mining fields.

"Marions" Show the Way

FOR more than a third of a century Marion Shovels have been a dominant factor in mining, quarrying and excavating. They have definitely and accurately pointed the way to better methods, quicker work, larger production and greater profits. They have truly kept pace with all the requirements of the industry.

As pioneer and leader, the dependable Marion always wins. Large "Marion" Revolving Shovels and Draglines remove the overburden and handle "big-scale" digging and loading. Railway-type Shovels—now furnished with crawler trucks—take care of work in close quarters or where "high-speed" loading is required. Smaller Marions of full revolving type have wide adaptability for general utility work, handling most any kind of stripping, loading or grading.

Illustrations show typical types of latest Marion models. Our new designs provide for steam, gasoline or electric power, with optional mountings suited to all classes of excavating work. Bulletins are available on each type.

Small Revolving Shovel on Crawler Trucks.
Readily convertible into dragline, clamshell or orangepeel excavator.

Railroad-type Marion on Crawler Trucks.
Easily moved—fewer men required—no planking, ties or rails to handle.

Marion Crawler Trucks Make Hard Going Easy

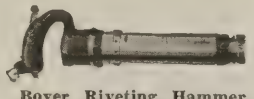
Boyer Pneumatic Chipping and Calking Hammer — for machine and boiler shop service. A handy tool in connection with mine car repairs.

Little Giant Air Drill —the pace setter in reaming nut-and-bolt tightening, etc.

Litte Giant Portable Electric Drill — for rapid drilling, reaming, etc.

CP's
contribution to lower machine shop costs

With a Little Giant Electric Drill and a Drilling Stand you can combine them into a high speed drill press in thirty seconds. They can be disassembled in the same period of time; the drill is then ready for use as a portable tool where required. It is economical to take the drill to the job and expensive to take the job to the drill.



Little Giant Air Drills literally punch holes through the hardest of steel. They will drill one and a half to two and a half inches per minute, depending upon the size of the drill being used.

Boyer Riveting Hammers drive rivets at a cost of three to five cents each. It costs from fifty cents to a dollar to cut out a loose rivet. The majority of Boyer driven rivets are perfectly driven. One or two less rivets to cut out daily pays for a Boyer in thirty to sixty days.

Think it over and let us assist you in lowering your machine shop and repair costs.

Chicago Pneumatic Tool Company

Chicago Pneumatic Building · 6 East 44th Street · New York

Makers of Cars and Whitney Wheels

Roller Bearing News

We sometimes see 'Paradise' coal advertised. Didn't know coal would be needed there.

5,064 of the 7,088 coal mines operating in 1921 were using animal haulage. All of them should have used Hyatt equipped mine cars, many of them did.

The offices of the New River Coal Operators' Association, formerly located at Charleston, W. Va., have been moved to Mount Hope, W. Va., and the office of the secretary and traffic manager consolidated, with S. C. Higgins, formerly traffic manager of the association, being made secretary and traffic manager, succeeding T. L. Lewis as secretary. (*Black Diamond.*)

"Ladees and gentl'm'n, begin to pack your duds for the biggest and grandest show of mining equipment and methods ever held, will surely be held, rain or shine, next September 24th to 29th in the beautiful city of Milwaukee. Good exhibits, good fellows, good golf, good dancing, good speeches, good auto rides, in fact, everything good will make the next meeting of the American Mining Congress the most gorgeous and wondrous display ever held under one roof."

"Friends, Romans and countrymen — my mine cars are equipped with Hyatt bearings, I have low haulage costs, have forgotten that there is such a thing as ever having to grease mine cars, my men are happier because the cars are easy to push and my production is getting better and better every day," is what a modern Mark Anthony of the coal industry would likely be moved to say.

Now that the weather is better and storms on the ocean milder, it is a great temptation to many fellows to start up a boat line to the Bahamas. Business must be good for everybody seems to be thirsty and while the goods go down the prices go up.

Our friend 'Rod' Neekamp has again been elected secretary of the Northeast Ky. Coal Association. Those Kentucky colonels sure do wear fine sombreros and when you talk about running a bang, up-to-date coal association—they do it.

Those business statistics in Coal Age sure are hot stuff. They keep a fellow all pepped up and he knows what is what now, before he used to be in the dark.

There is one thing a mining man is never ashamed of and that is that his mine cars are equipped with Hyatt bearings. He swells up with pride when he tells how good they are.

Donk Bros. Coal & Coke Co. is erecting one of the largest tipples in the state of Illinois at Mine No. 4, near Edwardsville, Ill. The airshaft has been hoisting coal for two years and now the main shaft is about ready. The tipple will be wide enough for six tracks and will have a capacity of 6,000 to 8,000 tons of coal daily. It will be 85 ft. in height. The company also will install one 750-kw. and one 1,000-kw. turbine generator. Electric current will be supplied to the mine at Maryville as well as No. 4 mine. (*Coal Age.*)

And speaking of the Bahamas, back in the old days whenever you wanted two fingers of anything refreshing you called for it by name and weren't satisfied until you got it. Whenever you want mine cars equipped with Hyatt bearings, call them that, don't just say roller bearings. Get what you want.

The assigned car problem continues to prove very perplexing and this subject is worthy of earnest study by all who are affiliated with the coal mining industry.

The coal carrying capacity of the Pennsylvania Railroad System, has, in the last few months, been increased by what is equivalent to the addition of 2308 new coal cars to the service.

Roller Bearing News

Some weeks ago a friend of ours who sells Hyatt equipped mine car trucks went to a mine and saw an old fellow greasing plain bearing wheels. Most of the grease went on the ground. He asked the old man how much he got an hour and was told 80 cents for a ten hour day, making $8.00. "But," the old man said, "I ain't worth it, mister, and I know it, and I would be willing to work for half as much if the cost of living would come down!" Which shows that occasionally we run across one of the mine workers who are of the old school and they, as a rule, fare worse than those who are more modern.

Every mining man who fails to send his operating, purchasing, and general supervisory heads to the Milwaukee meeting and exhibition of the best and latest equipment—September 24th to 29th—of the American Mining Congress will miss a grand opportunity to have his officials observe and hear the most recent developments in the mining world.

Not so long ago a mining man down in Eastern Kentucky told one of our fellows that the only trouble with Hyatt bearings is that they won't grease the wheels they are put in. We guess that Hyatts have done so much for him that he thinks they should cure all of his troubles just like a patent medicine. He shouldn't kick—he only has to grease them three times a year. Some snap!

Back 'befo' de war' the city of Milwaukee was famous for its sparkling brews. Now we seem to just recall that it's a beautiful city on the bank of a big lake with "water, water everywhere, and not a drop to drink."

Of course, we can't say for sure, but we are afraid that if some operators ever stopped to figure how much money they could have saved by using Hyatt equipped mine cars instead of the old-fashioned kind, the kind that run hard, that they would worry themselves to death. A word to the wise is sufficient.

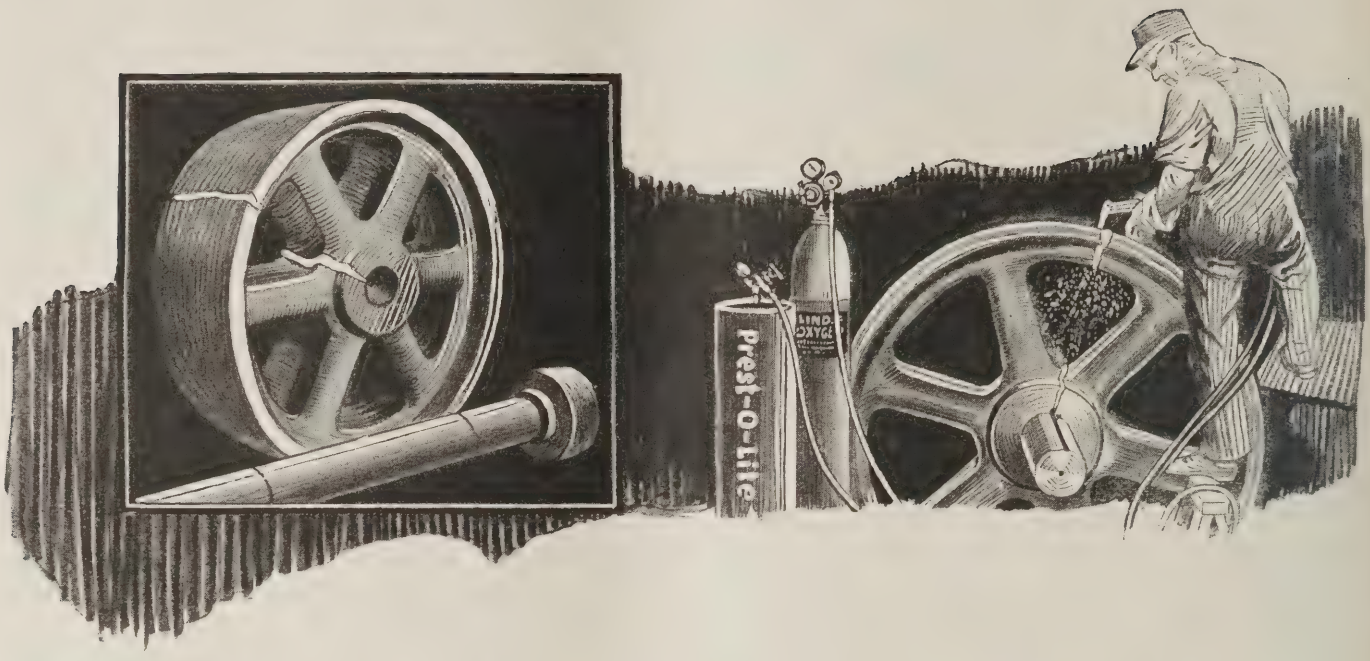
The lake coal trade is running full tilt and the Northwest is getting lots of coal. General business is good up there in the summer resort country.

The Monogah Fuel Company having recently acquired a large tract of land adjacent to its present mine at Kuhn's Run, in the Marion County field of West Virginia, has completed plans for the installation of a plant with a daily capacity of 1,500 to 2,000 tons a day. The more the merrier.

Mine Operator: My Hyatt equipped cars are sure salubrious.

Another One: Say do you know what salubrious means. It means healthful.

First One: That's what I mean. They save so much money in the way of power, gouged out wheels, repairs to locomotives, and stuff like that, that they put joy into your life and if they do that they must be *healthful* cars.



Shaker screen equipment of the most modern type was recently installed at the Eureka Mine of the Consumers' Fuel Company, Randall, W. Va.

It is reported that many mining districts are suffering because of the shortage of labor of the common class due to the immigration bars which are still with us.

Indiana people have organized the Erwin Block Coal Company which has a capital stock of $150,000 for the purpose of operating in Southern West Virginia.

The Bell and Zoller Mining Company holds—at the time of going to press—the world's record for production of coal from one shaft in any single month. Hyatt equipped cars have been adopted as their standard.

You better ask almost any of the reputable mine car manufacturers to furnish you with Hyatt bearing trucks for your old or new cars.

A Triumph in Cast Iron Cutting

Here was a case that made the plant engineer scratch his head.

This big cast iron pulley wheel housed a frozen shaft that had to be removed in the quickest, easiest way—*and still preserve the shaft.*

The remedy—the standard Oxweld Cutting Torch. The operation was performed with neatness and dispatch and of course was absolutely successful, the shaft coming out in perfect condition.

Oxweld is continually coming to the aid of the industry with such feats as this. As the possibilities of the process become more widely appreciated it is considered more and more an indispensable part of plant equipment. Its saving in repair and reclamation is tremendous.

Oxweld Resident Engineers in over fifty cities are ready to advise in your problems on welding and cutting. Send for illustrated book, "Oxweld Can Do It."

Tougher than the hoofs of the heaviest electric mine mule!

"DURABIL" FROG *of* Titanium Steel

Here's a new wear-resistant Frog—a one-piece proposition made of Titanium Steel.

No rivets or bolts in its construction. No splice bars required. Guaranteed against breakage and will outlast a dozen or more cast-iron or semi-steel frogs.

A match for expensive manganese frogs used on standard-gage roads—and as low in cost as inferior steel track work.

The rail is simply bolted to the frog, assuring absolute rigidity and ease of installation. Standard track bolts are used to attach the frog to the rail. Made for all standard rails 12 to 60 lb. The price is surprisingly low.

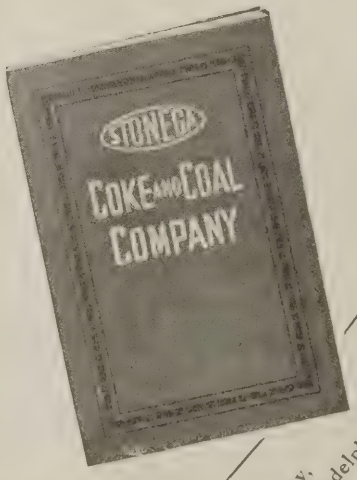
For those who prefer cast iron and riveted plate type,we can supply their requirements likewise; quoting on switches, crossings and all track accessories.

Every mine executive should know the facts about this new "Durabil" Long-Service Frog. Let us know where we can reach you.

DURABIL-STEEL TRADE MARK

L. A. GREEN, Track Specialist
First National Bank Bldg., Pittsburgh, Pa.

The Stonega Coal Pile—



your never-failing source of supply

Not only are our mines non-union and thus able to continue operations during strike disturbances, but we are equipped far better than the majority of coal companies to meet the demands of our customers.

One of the plans we put into effect to meet the excess demand during the war still continues to function. Our central storage yard, capacity approximately 125,000 tons, is an inexhaustible source of supply to our customers.

The low-sulphur content of Stonega Coal is demonstrated in its adaptability to storage purposes. At different times this pile of coal, thirty feet high, remained untouched during the most extreme weather conditions. Surprising as it may seem, the change of temperature throughout the pile, during this time, was barely perceptible. This fact was definitely established by means of a system of piping extending into the pile at stated intervals and temperature readings taken frequently.

Some vitally interesting facts are to be found in the Stonega Booklet. ***Mail the coupon today for your copy.***

The Coal Mines as Power Users

NEXT to central stations, the coal mines, burning approximately 22,000,000 tons per year are larger users of steam coal than any other single industry. The total boiler horse-power generated at both anthracite and bituminous mines in the State of Pennsylvania alone is estimated at 1,000,000.

BASED UPON the proportion of Pennsylvania tonnage to the total production of the industry in the United States, it has been conservatively estimated that the industry as a whole produces a total of 2,000,000 boiler horsepower; thus

making coal mines—next to central stations—the largest users of stationary power plant equipment in the world.

IN ADDITION to this power generated at the mines, it is estimated that the industry purchases 2,000,000 electrical horsepower from central stations, making the total power requirements 4,000,000 hp.

FIFTY-TWO times a year COAL AGE tells this huge industry something new about more and better methods of generating and applying power. To the men at the mines responsible for coal production—and to manufacturers who equip the industry—its services have justly made it—

"The Largest Coal Mining Journal in the World"

POSITIONS VACANT

ASSISTANT coal mine superintendent for Peru, South America; young active man, preferably with both practical and technical training, knowledge of Spanish desirable; salary $5,000 per year and traveling expenses. Apply C. P., Box 64, Trinity Station, New York City.

COAL mine transitman, with some office experience, for position with consulting engineer who is willing to turn over an interest in his business to the right man; salary $150 to $200 per month to start. For particulars, address Mining Dept., The Engineering Agency, Inc. (Established 1893), 53 W. Jackson Blvd., Chicago, Ill.

DRAFTSMAN or designer wanted; experienced on electric mine hoists. In answering, state age, experience and salary required. P-327, Coal Age, Old Colony Bldg., Chicago, Ill.

POSITIONS WANTED

AS MINE superintendent or engineer, technical graduate, twelve years' practical experience; married, age thirty-nine; good health; go anywhere. PW-332, Coal Age, Real Estate Trust Bldg., Philadelphia, Pa.

FUEL engineer, technical graduate; three years' mining experience, five years' experience in efficient boiler room operation; understands coal mining and combustion thoroughly. PW-334, Coal Age, Old Colony Bldg., Chicago, Ill.

GENERAL manager for three mining companies desires to make a change; age thirty-five, technical training, practical experience and corporation executive. PW-318. Coal Age, Old Colony Bldg., Chicago, Ill.

HUSTLER, practical engineer, wants position mine superintendent or general superintendent for several mines; age thirty-two years. Experience: Eight years miner; three years mine foreman; ten years superintendent; excellent record handling men; lower production costs last year than any mine in district; have opened and equipped four new mines; reference. PW-333, Coal Age, Old Colony Bldg., Chicago, Ill.

MINING engineer desires position as superintendent, engineer or mine foreman; twelve years' experience engineering and operating; employed at present; age thirty-two, married. PW-329, Coal Age, Real Estate Trust Bldg., Philadelphia, Pa.

MINING engineer, age thirty, university graduate, nine years' general engineering experience covering prospecting, construction and operation in West Virginia and Kentucky, desires position with progressive company; salary $275. PW-328, Coal Age, Leader-News Bldg., Cleveland, Ohio.

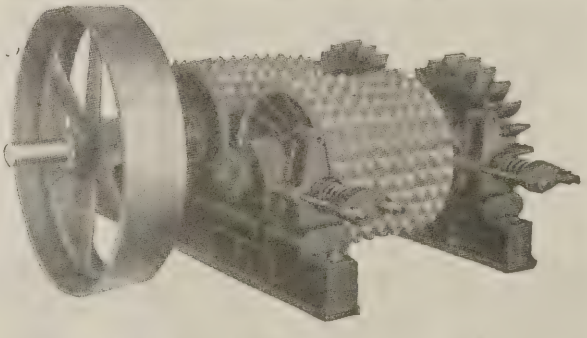
ACCURATE WEIGHTS
—will save you money



Accuracy always pays. *Everybody* benefits by accuracy and real efficiency, and nobody loses anything.

Streeter-Amet weighing and recording machines will weigh cars or hoppers at your tipple many times faster and far more accurately than weighing by hand. It both weighs and records—automatically. The uncertainty and mistakes of the "human element" are entirely eliminated. The *miners* depend upon the Streeter-Amet Machine because they know it is accurate. *You* save all losses due to overpayments.

Streeter-Amet Machines can be used with any standard scale. Sold, or rented.

Streeter-Amet Weighing & Recording Co.,
4101-4105 Ravenswood Ave., Chicago, Ill.

Scottdale Crushers Have Every Necessary Feature

Scottdale Coal Crushers, developed by years of service in coal fields and power plants, present each vital feature a crusher must have—sturdy, dependable construction, simplicity of design, and efficiency of performance.

Unusual quality of materials, heavy duty construction absolute simplicity, make continuous and dependable performance a certainty with Scottdale Crushers.

Marion quality is built into every one of them. There is a Scottdale Crusher for any requirement from 24 to 240 tons capacity. Send for bulletins.

A Super Tower

Generosity typifies the design and construction of Caldwell Structural Towers. To provide the strength and sturdiness that have marked the unusual success of this type of tower for heavy loads and great heights we have spared no precaution in material or workmanship.

This tower is built of heavy structural shapes thoroughly laced and riveted together by the most modern scientific engineering methods. It is built for steel or wood tanks in capacities from 15,000 gallons upward.

Every coal company should have a set of this work

Bacon and Hamor's

American Fuels

By RAYMOND FOSS BACON, formerly Director of the Mellon Institute of Industrial Research, and WILLIAM ALLEN HAMOR, Assistant Director of the Mellon Institute of Industrial Research.

Assisted by a Staff of 20 Specialists

MELLON INSTITUTE TECHNOCHEMICAL SERIES

Volume I.—630 *pages*, 6 x 9, 132 *illustrations.*
Volume II.—615 *pages*, 6 x 9, 250 *illustrations.*
Per Set, $12.00 *net, postpaid. Not sold separately.*

THE whole subject of the characteristics and economic utilization of fuels of all kinds is exhaustively treated in this comprehensive treatise.

The engineer will find it a complete summary of modern information concerning fuels. Every important research effort, every worthwhile investigation, in the field of fuel engineering, is here summarized and interpreted in the light of modern practice.

Every coal company should have this great work available for reference. It will supply sales ammunition, engineering data, cost data and information on testing and analysis that will prove of priceless value.

The two books present for the fuel producer a complete encyclopedia on every phase of fuel production and use.

The books cover

the characteristics of fuels
the production of fuels
by-products
analysis and testing
economic utilization of fuels
advantages of specific fuels for specific purposes
relative costs of fuels
fuel conservation

Stop that waste!

Leakage through the blow-off line causes heat waste and reduces the efficiency of the boiler.

LUNKENHEIMER
Blow-off Valves

remain tight under the most extreme operating conditions because their design guards against the CAUSES of a leakage by automatically cleansing the seating surfaces before the disc becomes seated and by minimizing wire drawing of the water across the seating surfaces.

Their construction permits of only a very gradual release of the water, and the danger incident to undue agitation of the water within the boiler and severe shock in the discharge line caused by sudden release, are eliminated.

Fig. 897

Booklet 515J describes the complete line. Write for a copy.

A Cure for Pinion Chipping

In the early days of hardened gears and pinions, chipping was not uncommon. With our "Tool Steel" product about two years ago, we absolutely solved this by softening the ends of the teeth a little at the armature end, so they would not chip.

This is illustrated by the accompanying cut.

White indicates the soft end of teeth to eliminate chipping

The standard of Quality
"Tool Steel" gears + pinions.

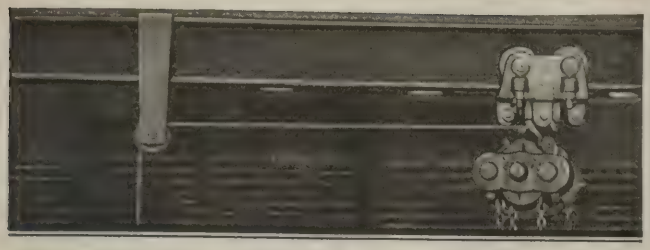
THOMAS

The results of more than thirty years' experience in solving coal mine hoisting problems is concentrated into the design and construction of Thomas Hoists. Each type of Thomas Hoist has been designed to meet a particular mine hoisting need. For either counterbalanced shaft hoisting or incline hoisting, there is a type and size of Thomas Hoist that will exactly meet your requirements, giving service of the highest efficiency, with lowest of upkeep costs.

The Thomas Elevator Company's Engineering Department is at your disposal. They will give you accurate counsel regarding any hoisting problem.

Thomas Elevator Company
29 So. Hoyne Ave., Chicago, Ill.

HOISTS



No Exposed Threads

Threads on SURE GRIP Trolley Clamps are absolutely protected from rust, dampness and battering. This makes the SURE GRIP Clamp good for years of service. It can be removed again and again from old working parts of the mine and used in a new location. It never wears out.

SURE GRIP Clamp will stop all your troubles with faulty over-head construction. SURE GRIP Clamps *holds*—under all conditions.

SURE GRIP

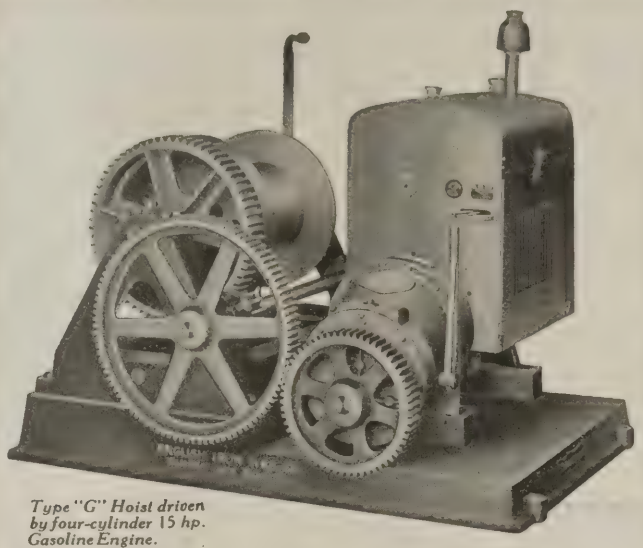
MATCHLESS TROLLEY

"Easiest to Start-Easiest to Keep Going"

Pulling a 1-ton Load with a 14-lb. Weight

The above test is graphic proof of the little effort required to start a heavy load and convey it to any desired point, when carried on a Matchless Timken-Roller-Bearing Trolley.

At 14 lbs. the trolley with its 1-ton load, started smoothly and rolled rapidly along the length of the overhead rail.



The Matchless required only about half the pull demanded by any other trolley—ball or roller bearing—when given the same identical test.

Matchless Trolleys in your plant mean less energy used, speedier action and more output per man.

Chisholm-Moore Matchless "Trolleys," "Cyclone" Chain Hoists, and "Carryall" Overhead Track Systems carried in stock by capable distributors in all localities.

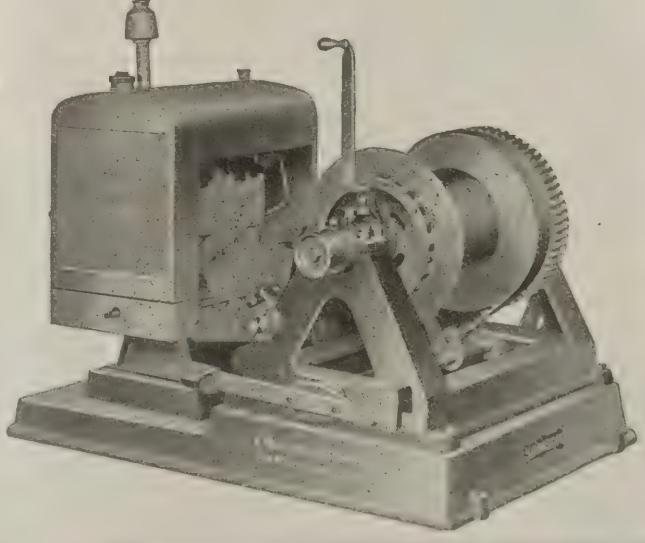
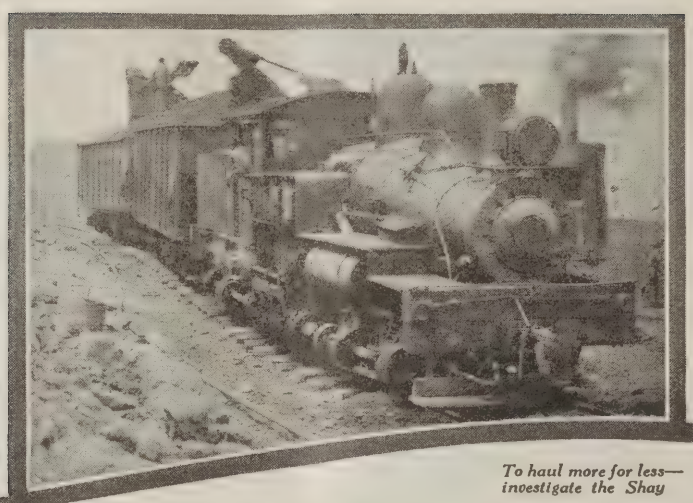
Type "G" Hoist driven by four-cylinder 15 hp. Gasoline Engine.

SAMSON



OUR type "G" affords a wide range of utility and it is economical. With its four-cylinder engine it is mounted on a cast iron sub-base as a completely self-contained unit. The drum is 12 inches in diameter by 16 inches long, fitted with bronze bushings and controlled by cone friction clutch and band brake. The lifting capacity is 2,000 lbs., plus a substantial reserve.



Guards (not illustrated) are furnished for gears and pinions.

The four-cylinder Gasoline Engine which supplies the power for this Hoist, contains all the good points of the most successful automobile engine. It is fitted with clutch to release engine for easy starting. A positive fly-ball throttle type of governor is used all enclosed and running in a bath of oil. Also high tension magneto and float type carburetor. It requires 15 to 20 per cent less fuel and oil than single cylinder engines and it runs without vibration.

Write for full details of the Type "G" and other Samson Hoists

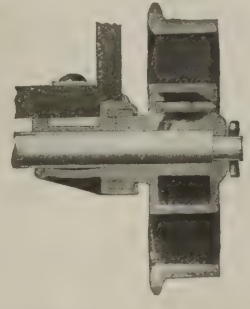
ORTON AND STEINBRENNER
standardize on
WILLIAMSPORT
Patented
WIRE "Telfax" Marked **ROPE**



It is the only Wire Rope made, the grade of which you are able to positively identify—a protection that may save lives for you if you'll adopt Williamsport Wire Rope as your standard.

Send for our booklet MWR which tells an interesting illustrated story about the "Telfax" Marker.

WILLIAMSPORT WIRE ROPE CO.
Main Office and Works: Williamsport, Penna.
General Sales Office: Peoples Gas Bldg., Chicago

Holds Lubricant for long periods—

Is seldom shopped on account of truck trouble.
Is easily applied with a few large bolts.
Is guaranteed for a year against hub wear.
Has full-floating axles with visible linch pins.

PHILLIPS
Patent Open Cap Wheel Truck

This Truck is the ideal running-gear for large or small mines, light or heavy cars, animal or mechanical haulage. It will solve that problem of hard-running cars—on level track it runs 25 per cent easier than other improved trucks selling at the same price.

Write us today

Phillips Mine and Mill Supply Co.
So. 23rd and Jane Sts., Pittsburgh, Pa

OHIO MINE CAR GREASE

Made in several grades to suit all types of wheels, whether plain, roller or ball bearing.

Its lubricating and lasting qualities are unexcelled—it, therefore, saves money, prevents hot boxes, reduces repairs, saves time and labor, permits heavier loading and speeds up production, thus increasing the efficiency of your whole mine.

Trial order sent FREE on request.

The Ohio Grease Company
Loudonville, Ohio

A Common Sense Haulage System

B & B Aerial Tramways take a bee-line from mine to tipple and dump your coal automatically. Keep your output moving, regardless of rain, sleet, snow or mud.

Save wages. Seldom require more than one or two attendants.

Operate by gravity in typical hilly coal country. When fall is insufficient, steam, gasoline or electricity may be used.

Friction Grip or Two-Bucket Types designed for your exact requirements. Built to last. Capacity guaranteed.

Full details in our interesting Aerial Tramway Book No. 9. Write for it.

Important Notice to Advertisers

To secure first-class typographical set up and enable us to submit proof in sufficient time to make any necessary correction before going to press, it is essential, that we get copy in our hands together with all necessary cuts at least three weeks prior to date of publication.

Coal Age

FROGS - CROSSINGS - SWITCH STANDS - SWITCHES - ROOM TURNOUTS - ETC.

The detailed refinements of "Cincinnati" Equipment distinguish it from the ordinary

Lugs used on all our standard switches are of heavy die-formed steel

Go over "Cincinnati" Track Equipment piece by piece and examine it thoroughly. If you will do this you will find many refinements which, though seemingly trivial in themselves, are important to you. They mark the difference between "Cincinnati" equipment and ordinary track equipment. Take for example the steel lug here shown. These are used on all standard "Cincinnati" switches.

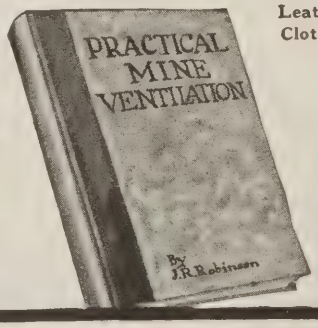
Switch Stand with Spring Connecting Rod

Split Switch

Spare Yourself!

Why continue to stand the annoyance and loss caused by poor or defective track work? It isn't necessary. Spare yourself! There is a way to assure yourself of efficient haulage. Dispose of those switches that don't work right half of the time and those decrepit frogs and crossings where the delays occur.

Replace them with Central Equipment. It has a world-wide reputation for efficiency and stability.



Call "Central" and ask for "Information"

Insulation

HAZARD
RUBBER INSULATED
WIRES & CABLES

TRADE MARK

The supreme importance of really efficient rubber insulation on Wires and Cables is too often overlooked.

Safety to life and limb, and long lasting service, should carry more weight than low price or any other consideration.

HAZARD Wires and Cables are *safe*. They stand up under unexpected surges in current because a high factor of safety is built into them — the compound ingredients are right, the formula is right, and the supervision and testing service are right.

For the difficult jobs we have developed special types of Cables that greatly outlast ordinary Cables. Get our special data on any of the following:

LORECA ARC WELDING CABLE, Extra flexible and wearproof. Patented.

SPIRALWEAVE PORTABLE CORD for Drills, Riveters, Portable Machinery, Etc.

LORECA REEL CABLE for Electric Mine Locomotives. Construction patented.

HAZARD HARD SERVICE MINING MACHINE CABLE. Twin or concentric. Built to withstand the hardest sort of work.

SPIRALWEAVE CABLE, loom woven covering for strength and wear.

PARKWAY UNDERGROUND CABLE, steel tape armored. No conduits necessary.

Quality Survives

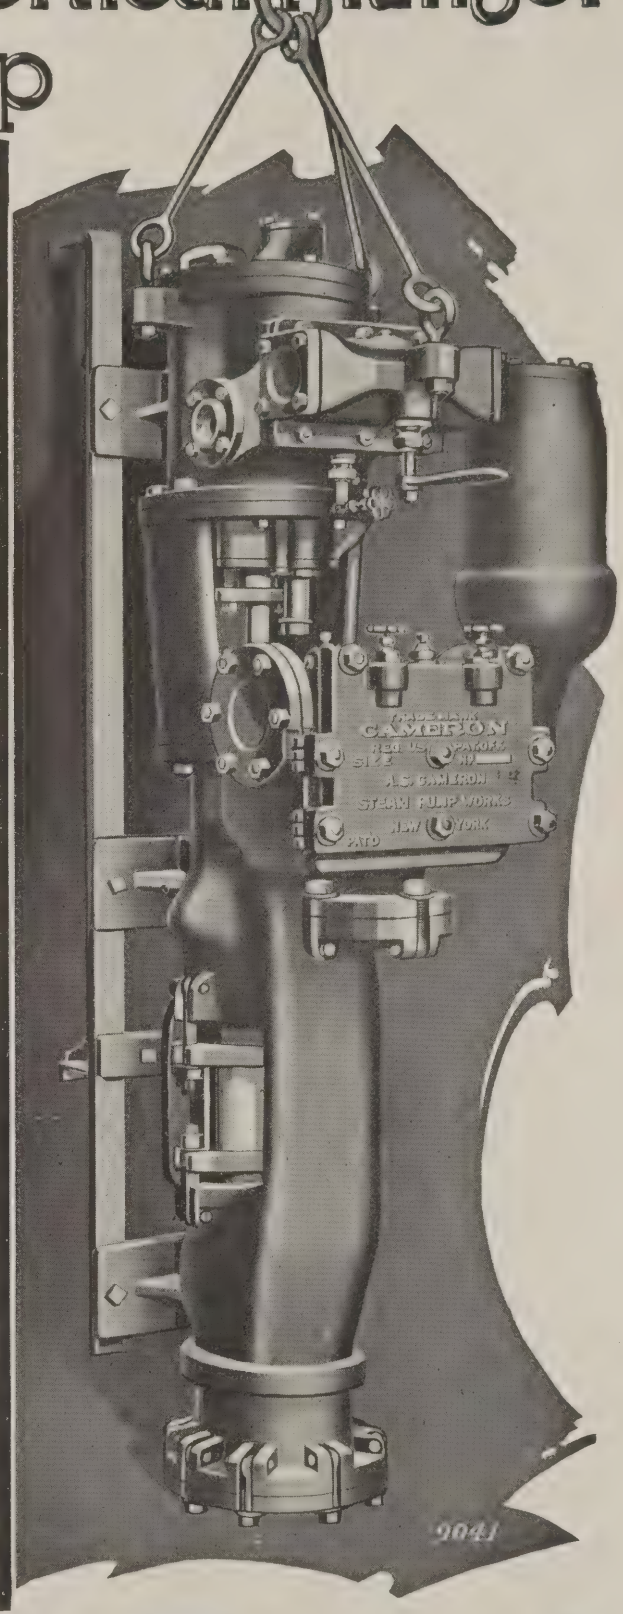
Use Ironite

Rubber Insulated Telephone Wire



For Your Telephone Lines IN YOUR MINES

It has greatest possible tensile strength, toughness of insulation and flexibility and high conductivity—all the essentials for best service and durability. More serviceable than hard drawn copper and a lot cheaper. *Write for free sample.*

Paragon Electric Co. 35 W. Van Buren St., Chicago

The Cameron Vertical Plunger Sinking Pump

A Rugged, Reliable Pump Which Will Handle Gritty, Dirty Water

It requires less space in the shaft than any other pump. There are no exposed parts liable to breakage from blasts or collisions with the side walls. No wearing parts in the water end, except the packing in the stuffing boxes which can be adjusted from the outside.

The Cameron Vertical Sinking Pump is also built in two other types:

The Sectional Pump—designed for mule back haulage, the heaviest piece weighing 300 pounds.

The Prospectors Pump—for shaft sinking and general work where large capacity is not required.

Cameron pumping service stands for reliability and economy combined with simplicity of construction.

Largest Strip Mine Preparation Plant

(Enos Coal Company, Oakland City, Ind.)

This is one of the largest strip mine plants in the country—completely Link-Belt designed and equipped.

There are five tracks beneath the tipple so that lump, egg, nut, screenings and crushed coal can be loaded all at one time. Loading booms are provided for the lump and egg, while for the nut and screenings, loading chutes are provided.

The plant is capable of running through four thousand tons of coal in an eight-hour day, and the storage tracks above the tipple have a capacity of 100 cars so that there will always be room for excess cars.

Our forty years of experience in designing and building such plants as this is at your service.
